I immediately took possession of the boy. I may say, and I do so because I wish to judge Mrs. Minter as leniently as is consistent with the truth, that both she and the boy were much affected at parting. The woman pleaded hard that he should be left with her a few months longer, and the boy was quite opposed to the separation; but I felt it incumbent upon me to be firm. I did not think I should be doing my duty towards my friend to leave his son, the heir to one of the oldest English earldoms, in the keeping of such people. I took the boy home with me, and he remained some months in my house. I never saw a youth improve so rapidly. He soon got rid of the roughness of manner which, spite of his natural refinement, he had acquired from Captain and Mrs. Minter, and showed himself an apt scholar both in letters and deportment. I may also state that for some months I was his only tutor. I was jealous of his future reputation; and I did not want him to come in contact with other boys of his age and station till I had toned down some of the ruder ideas and feelings imparted to him by his early associations.

Meantime, I had written another long letter to Lord Mortlake, informing him of the discovery of his child, and asking him for instructions as to my further proceedings. At the end of six months this letter also remained unanswered.

I shall now have to pass over an interval of twelve months, during which, however, circumstances took me one step farther towards the solution of the mystery which surrounded the death or disappearance of Lord Mortlake's wife.

It was the height of the London season, and upon one of the Reception days I was watching the carriages slowly defiling towards the Palace. Indeed, I could not but feel a sort of pride in the array of beauty and magnificence that met my view; thinking, and I believe with perfect justice, that in no other capital in Europe could be seen such an exhibition of grace, elegance, and beauty; when I was struck by one lady whose beauty transcended all the rest. There was power and intellect as well as extreme

loveliness in her face—a handsome and regal woman, the very Queen of Beauty. The carriage was moving slowly, so that I had time to take in all the details of her features. It was, however, not so much the charm of these that struck me, but their familiarity. In them I recognised those of the girl I had married to Lord Mortlake—Caroline Amelia Craven.

I asked a footman who was standing near by, whose carriage it was, and the reply was Lady Synge's. I did not remember the name; so I went home and consulted the Peerage and Baronetage, and found that Lady Synge must be forty-five at the least. Evidently, there had been a mistake; the lady in the carriage, and whose features I fancied I recognised, was not much above thirty. I say, whose features I fancied I recognised; but in reality I had no doubt that she was the very woman I had married to Lord Mortlake at Knutsfield church, and whom he had been deceived into believing was dead. But here a queer doubt arose in my mind. Was Lord Mortlake deceived as to her death? or did he, when he said she was dead, speak metaphorically?—did he mean that she was dead to him? These were questions I could not answer; but I believed that I had conclusively settled one fact—that the woman whom Lord Mortlake had married was still alive.

I remained in town some days after this; but though I frequented the fashionable quarters, and visited the Parks daily, I saw no more of the lady whom I had believed to be Lady Mortlake.

Time passed on, and I was still without news of Lord Mortlake, and fears were being entertained that he had come to an untimely end. I had written to his New York bankers, and had a reply. They had a large sum of money still in hand; but the Earl had not drawn upon them for many months. All my letters had been duly forwarded to St Louis, on the banks of the Missouri; and information from thence had been obtained that, when last heard of, Lord Mortlake was following the course of the Yellowstone River, with the avowed purpose of crossing the Rocky Mountains.

INSECTS AND FLOWERS.

UNTIL the end of last century, butterflies, moths, and many winged creatures were allowed to flit about the painted fields without arousing the faintest curiosity as to their movements, or the least suspicion that they were doing any particular good. Fluttering a careless life away, they were supposed to be having a good time of it. This 'pursuit of pleasure' was permitted them without any reproach, on account of its brevity. One burning noon, a shower, a shadow, the dew of twilight, and their precarious existence was over. Not the most energetic utilitarian ever dreamed of interfering; and the only shade of criticism cast on their proceedings came from the superior behaviour of one of their own order, the compulsorily unselfish honey-maker.

But in the year 1793, Christian Sprengel, an enthusiastic German botanist, of strong imagination and deep religious feeling, published a work which, translated into English, bears the somewhat audacious title of *The Discovered Secret of Nature*.

He was the earliest observer of the relations of insects to flowers, and knew that they were attracted from great distances by conspicuous colours and agreeable scents. He not only understood the use of these universally acknowledged guides, but went so far as to assert that dark-coloured marks and streaks on the corolla of a flower served as path-pointers to the nectary. Fallacious guides, it is true, he often declared them to be; for, not believing in the high intelligence even of bees, he imagined that they were led to visit certain kinds of flowers which existed by an organised system of deception—*Scheinsäublumen* (sham-nectar producers). The visits of insects were indispensable to their fertilisation, but the banquet was never forthcoming. Delpino supported him in this opinion; but Darwin, although unable to find true nectar in several kinds of orchids, could not believe in what he termed so gigantic an imposture, and discovered that in cases where the nectaries are dry, a fluid may be found in a lax inner membrane, which the proboscis of some insects is able to reach. It is a curious fact that Sprengel, whilst aware of the many beautiful contrivances in flowers which can only be explained by their relation to insects—since self-fertilisation is evidently in many cases impossible—still stopped short of the mark, and was not aware that there was any difference in power between pollen from the same plant and pollen from another plant of the same species.

H. Müller, in his work on the Fertilisation of Flowers, refers to this, and says: 'It is remarkable in how very many cases Sprengel rightly perceived that pollen is necessarily transported to the stigmas of other flowers of the same species by the insects which visit them, and yet did not imagine that this transportation was of any service to the plants themselves.' He could hardly, however, have failed to remark that between anthers and stigma, even if inclosed in the same envelope, there is generally some obstacle interposed, which looks as if the object were not to do what, on the other hand, it is the clear intention of Nature should be done. He saw that this was a strange thing; and by degrees he came to think that he had solved the mystery, and discovered Nature's secret! What, by reason of their own arrangements, flowers were unable to do for themselves, bees and other insects were invited to do for them. If the stigma should be placed so far above the anthers that the pollen-dust could by no manner of means reach its viscid surface—if the anthers, when they became ripe, should suddenly whirl round and scatter their contents in another direction—if they habitually faced away—if there were some lid or shelf to prevent the pollen from falling on to the stigma—if, when shut up together in a common envelope, the stamens and the stigma do not come to maturity at the same time—then Nature instructed insects to correct these mistakes, and by dusting themselves with the pollen, to spread it where it ought to be placed.

Sprengel does not appear to have been struck with the inconsistency of a separate set of ways and means being thus organised, when the required end would so simply and obviously have been attained by the slightest possible alteration in the organs of the flower itself.

Almost about the same period, the whole secret

would appear to have been also in the hands of Erasmus Darwin; but he too failed to perceive the real meaning and immense importance of his own discoveries. He understood the production of different, and sometimes more excellent varieties by the transfer of fecundating dust from the anthers of one flower to the stigma of another of the same species, and describes how a cabbage was thus produced which was said to 'fatten a beast six weeks sooner than turnips.' The sort of cabbage in use was the tallow loaf or drumhead cabbage; but it being too tender to bear sharp frost, some of it and the common purple cabbage used for pickling—the hardest known—were planted alternately, and when the seed-pods were perfectly formed, the purple were cut down, and the other was left for seed. 'This,' he says, 'had the desired effect, and produced a mixed stock of a deep green colour with purple veins, retaining the size of the drumhead, and acquiring the hardness of the purple.'

Here was the secret practically discovered; but still, it did not occur even to so shrewd an observer that this very cross-fertilisation is the law of Nature, and is daily carried out, not by the hand of man, but by butterflies, moths, and bees. It remained for Charles Darwin, the most patient, sagacious, accurate, and truthful of investigators, and whose lamented death took place so recently, to point out the true meaning of the secret which Sprengel held himself to have sounded, and to show why flowers should be visited by insects, and how cross-fertilisation is practically insured by contrivances of endless ingenuity and beauty. The simple fact of the existence of such contrivances would be sufficient to prove that some advantage was to be gained. Urged on by this conviction, continually confirmed and strengthened by the most minute observations and the most careful experiments, Darwin has been enabled to demonstrate unmistakably that the offspring of flowers crossed by pollen from another plant of the same species are markedly superior to the offspring of those which have been self-fertilised; that they are in every way better fitted for the struggle of life; that they have an innate power of resisting unfavourable circumstances; and when subjected to severe competition, exhibit a superiority in their power of growth.

Darwin's experiments, which he pursued during the course of a great many years, are not difficult to follow. To carry them out successfully they require the same care and patience that he himself expended upon them; but they are neither very intricate nor very costly. He thus describes what was his own manner of proceeding. A single plant, if it produced a sufficiency of flowers, or two or three plants, were placed under a net stretched on a frame, and large enough to cover them completely. Thus protected, several flowers were marked, and fertilised with their own pollen; and an equal number of the same flowers, marked in a different manner, were at the same time crossed with pollen from a distinct plant. Care was next taken that the seeds were thoroughly ripened before being gathered. Afterwards, the crossed and self-fertilised seeds were placed on damp sand, on opposite sides of a glass tumbler, covered by a glass plate, with a partition between the two lots, and the glass was placed

on the chimney-piece in a warm room. As often as a pair germinated at the same time, they were placed on opposite sides of a pot, with a superficial partition between the two. In comparing the two sets, the eye alone was never trusted. The height of every plant on both sides was carefully measured. Independently of any external cause which could be detected, the self-fertilised plants were more liable to premature death; and with a large number of specimens the crossed plants not only exhibited a well-marked tendency to flower before the self-fertilised ones growing in the same pots, but produced a greater quantity of seed.

Sometimes crossed and self-fertilised seeds were sown in separate rows in the open ground, which was kept clear of weeds, so that the seedlings were not subjected to any competition with other kinds of plants. Those, however, in each row had to struggle with the adjoining ones in the same row. Darwin relates that he covered a foxglove plant growing in its native soil, with a net, and fertilised six flowers each with its own pollen, and six others with pollen from another foxglove growing within the distance of a few feet. The covered plant was occasionally shaken with violence, so as to imitate the effects of a gale of wind, and thus to facilitate as far as possible self-fertilisation. It bore ninety-two flowers—besides the dozen artificially fertilised—and of these only twenty-four produced capsules; whereas almost all the flowers on the surrounding uncovered plants were fruitful. Of the twenty-four spontaneously self-fertilised capsules, only two contained their full complement of seed; six contained a moderate supply; and the remaining sixteen extremely few seeds. Seeds from the above crossed and self-fertilised capsules, after germinating on bare sand, were planted in pairs on the opposite sides of five moderately sized pots, which were kept in the greenhouse. The plants after a time appeared starved, and were therefore, without being disturbed, turned out of their pots, and planted in the open ground in two close parallel rows. They were thus subjected to tolerably severe competition with one another, but not nearly so severe as if they had been left in the pots. At the time when they were turned out, their leaves were between five and eight inches in length; and the longest leaf on the finest plant on each side of the pot was measured, with the result that the leaves of the crossed plants exceeded on an average those of the self-fertilised plants by a quarter of an inch.

In his work on the Fertilisation of Orchids, Darwin has fully described the marvellous mechanisms by which cross-fertilisation is in almost every species there secured; but it is an error to imagine that though their adaptations for the purpose are more obvious than in any other group of plants, the case is exceptional. The manner in which the anthers of *Salvia* are depressed by a lever-like action, and rubbed upon the backs of bees, is equally curious; and Müller describes a plant, *Posoqueria fragrans*, whose anthers explode when a moth visits the flower, and cover the insect with pollen. One of the filaments, which is broader than the others, then moves, and closes the flower for about twelve hours, after which time it resumes its original position. Thus the stigma cannot be fertilised

by pollen from the same flower, but only by that brought by a moth from some other flower. Endless would be the list of similar contrivances, not only to be met with in rare and singular plants, but in our own hedges and fields at every turn on every summer day; and Nature, whilst alluring those insects to visit plants whose agency is necessary, displays an almost equal sagacity in preventing the visits of unprofitable or dangerous guests.

Insects must have a certain size, shape, and weight, before they can be of use. Some inkling of excluding-contrivances has casually occurred to reflective botanists; but it is to Kerner that we owe the explanation of a great many floral structures which can evidently have no other meaning than to shut out unbidden visitors. Erasmus Darwin remarked upon the protective function of the connate leaves of the teasel, but without having much notion why the nectar should be guarded. Belt, in his *Nicaragua*, observes that many flowers have means of preventing insects from obtaining access to the nectar; and Dr Ogle, in his preface to his translation of Kerner's work, describes the ingenious protection afforded by viscous rings. *Stickiness* is one of the true protective appliances recognised by Kerner; and he further holds that the position, direction, and shape of the leaf are of just as great significance for the preservation of species, as the form, colour, and scent of the flowers; that not even a hair is meaningless, whether found on the seed-lobe or the leaf, on the stem or the blossom; thus repeating Sprengel's conviction, that 'the wise Author of Nature would not have created even a hair in vain.' The flowering process is necessarily exposed to many dangers—dangers from grazing animals, from caterpillars, snails, and small insects; but ruminating animals, such as cows, are endowed with the instinct to avoid the most beautiful blossoms; far from being attracted, they are apparently repelled by colours and scents. Kerner, for instance, bids us remark, that when cattle are driven to their pastures through countless blossoms of Colchicum, Parnassia, and Euphrasia, they go along snatching the sprouting leaves and grass, and of other plants from among the flowers, but never touching the flowers themselves; and in cases where the flowers are so intermixed with leaves, or so close to them that the destruction of the one involves the destruction of the other, even the leaves are avoided!

It has been already mentioned that Erasmus Darwin was the first to recognise the water collected in the leaves of the teasel as a protective appliance; and there are many other common plants whose funnel-shaped leaves retain water for a length of time. The flowers belonging to them, usually full of nectar, are thus rendered perfectly inaccessible to any but flying insects; and it is needless to say that plants growing in water are still more thoroughly protected. Against such intruders as snails and caterpillars, hairs and bristles are employed. Such soft-skinned animals are particularly sensitive, and quickly learn to shun the contact of a stiff sharp point. The lower bracts of flowers are often furnished with such points, and down-pointing needles are frequently massed at certain spots. It may be laid down as a rule that the closer to the flower, the greater the accumulation of prickly formations. Kerner

gives an enlarged drawing of *Centaurea cyanus*, whose stem and leaves are free from prickles; while every one of the lower involucre bracts is beset with saw-like teeth round its whole margin, excepting when overlapped by a neighbouring bract. All these teeth curve down, so that their needle-like points are presented to any animal that would creep up into the flower. On the common thistle, both up and down pointing needles may be seen. Another plate represents a flower of the *Melampyrum pratense*, where the pricklets are set on the filaments of the anthers, inclosing the entrance to the nectar recess like a pair of toothed jaws; the object being to deter creatures that would creep in from below or from the sides, but presenting no obstacle to the proboscis of the welcome bee. In many lilies and in gentians, where the nectar is placed in certain depressions of the corolla, a kind of cage is formed over them by twisted hairs. Insects approaching from above can push their proboscis between the bars of this trellis; whilst smaller insects are excluded, and are caught and held fast as securely as in a spider's web.

But in the conformation of the flower itself, the most beautiful preventive arrangements are to be found; and the most multitudinous. Kerner divides them into two groups: one containing those structures which completely cover in the nectar; the other containing those in which the closure is incomplete, only a narrow orifice being left. In the first group, insects have no means of access except by lifting up the over-arching or closely approximated parts, which always implies a vigorous push, and can never be effected except by an animal of tolerable size; for a creature of such dimensions as not necessarily to come in contact with the pollen and stigma, will also be without the strength to push asunder the parts which form the nectar cavity. Antirrhinum and Toad flax are quoted as instances of this formation. An insect alighting on the lower lip cannot get at the nectar in the spur unless it is heavy enough to depress the lip. In the second group, where the passage is not completely closed, the constriction is effected by curvatures and swellings. In the Narcissus and *Oenothera*, the lower part of the perianth is narrowed into a channel only wide enough to admit the entrance of a long proboscis. Sometimes it is the corolla which serves the purpose, being reduced in its lower part to a long straight tube. In Monkshood, the limb of the petal is rolled back in a spire; the nectar is therefore inaccessible to small insects. In *Calceolaria*, the whole lower lip is rolled into a pouch whose entrance is so tortuous that it becomes impossible to most insects to get at the nectar. Strong and heavy humble-bees alone can rifle it, and in so doing, they must come in contact with stigma and pollen.

Such innumerable instances and examples of contrivances transcending all that the most fertile imagination of man could invent, are crowded together in the works of Darwin, Sir John Lubbock, Kerner, and others, that it is difficult to know where to stop in making mention of them; but the result amounts simply to this, that so infinite a variety of means points to one unmistakable object. Insects that convey pollen from plant to plant are welcome guests, and

useless creatures are excluded. The discoverers of the last century paved the way to the advanced knowledge of this. They were well satisfied with a little learning; and it is only another proof of the extreme modesty of true science, that our present great and successful investigators do not now proclaim that they have discovered the secrets of Nature, but rather that their knowledge is still in its infancy; that a rich field for observation and experiment is open, and that the veil is far from being lifted.

THE HUMOURS OF A BUILDING SOCIETY'S BANQUET.

Most people are familiar with the course of proceedings at the annual dinners, held in London, of the great Societies, benevolent, literary, dramatic, scientific, and otherwise, which are frequently graced by royalty, and made illustrious by the presence of influential and popular members of the old nobility. The other end of the social scale, however, may not be quite so well known; and a description of the annual dinner of one of the smaller Friendly Societies may possibly be novel as well as amusing.

We will ask the reader to accompany us, then, to the annual dinner of the Kosmos Building Society, which is to be held at one of the larger taverns in the City. Dinner is announced for six o'clock; and by about half-past five, the guests—most of whom are of the small shopkeeper class of the East End of London—begin to assemble in the waiting-room, flocking together in groups of about five or six, and vainly endeavouring to look comfortable in their badly-fitting Sunday clothes. Presently, an individual, who perchance has been in service in a gentleman's family, or, what is more probable, knows some one who has, makes his appearance at the door in evening dress, with white tie. A knot of men standing near one of the windows turn round to look at him, and then surmise among themselves as to who that 'parson-lookin' chap' is; until one individual, of superior imaginative powers, boldly hazards the suggestion that 'it's the bloke as is goin' to say grace!' Satisfied with this explanation, they turn their backs on him, and resume the occupation of staring fixedly out of the window on to the busy street below.

Meanwhile, the 'parson-lookin' chap,' who is not in holy orders, but is a thriving young tradesman, has made his way to another corner of the room where a few of his particular friends are assembled. He sits down amongst them; and with the air of a man perfectly accustomed to this sort of thing, rings the bell for the waiter, and orders 'Arr a dozen glasses of sherry an' bitters, sharp;' and as the waiter disappears through the doorway, calls out after him with the air of a connoisseur: 'Dry sherry, waitaw!' Whilst he and his friends are engaged in sipping this appetising beverage, he regulates their ears with a choice commercial anecdote. It appears that 'Ole Bloggs the 'olesale tater-man sent eight bushel o' taters to Jimmy Smith down our way; an' Jimmy Smith let 'em lie out in 'is shed all night, an' in the mornin' they were all frost-bitten, so 'e sent 'em ivry one back. An' Ole Bloggs 'e were that savage, an' vowed if 'e iver

sold Jimmy Smith any more stuff agen, 'e wished as 'ow 'is corpse might walk!' This delicious piece of humour is highly relished by the audience, who are divided betwixt admiration at the display of business-like strategy on the part of Jimmy Smith, and amusement at the craving for post-mortem perambulation evinced by the exasperated Bloggs. Fresh comers keep dropping in and going up to where their own acquaintances happen to be congregated. The favourite mode of greeting appears to be: 'Illo! who'd a thought o' seein' you 'ere?'—a form of recognition evidently containing some hidden humour, as it is invariably followed by a choking giggle on the part of both parties.

Presently, dinner is announced; and the whole company are jostling and treading on one another's heels in their eagerness to get to the doorway. Some considerable confusion ensues before all are seated; but when at length order is restored, the waiters commence to serve without any audible invocation of a blessing on the meal, either from the 'parson-lookin' chap' or any other functionary, clerical or otherwise. At the last moment it is discovered that the Chairman of the Society is absent; and after several members of the Board have obligingly volunteered their services to supply his place, the oldest Director present is duly installed in the seat of office. When all are served, a lull for about twenty minutes takes place, broken only by the clattering of knives and forks, and the varied sounds emitted by the guests as they proceed from time to time to quench their thirst. But after the keen edge of the appetite has been taken off, the hum of conversation breaks out afresh.

'Mr Tomkins!' bawls out a pompous, podgy, little man from the Directors' table, holding his glass in his hand, 'I looks towards yer.'

'All right, Ginger!' is the familiar response of the individual thus apostrophised, a gaunt, lanky, cadaverous-looking man, with an enormous collar, and an exaggerated black silk necktie. 'I dessay yer does; ony don't worrit me now—I'm eatin'!'

The little man addressed in this friendly off-hand fashion looks round very fiercely for a few moments; but finding apparently no notice taken of his spicy patronymic, calms down, and assumes an expression of awful benignity.

In a little while a slight bustle takes place at the upper end of the room; and the energetic undersized Secretary leaps to his feet, and in an excited tone makes the startling announcement: 'Gentlemen, our Chairman 'as arrived.' This piece of information fails to produce the electric effect which had doubtless been anticipated, the majority of the guests being, like the unsociable Mr Tomkins, still too much absorbed in the all-important process of sustentation, to pay much heed to the arrival of the Chairman or any one else; and it is not until the announcement has been repeated in a louder and shriller key, that a few persons near that end of the room look up from their plates, and hammer hastily on the table with the handles of their knives, to express their deep sense of gratification at this auspicious event. In the meantime, the Chairman remains standing at the side of the chair occupied *pro tem.* by his substitute. As that gentleman does not offer to vacate the place of honour, the Chairman remarks to him in a

mildly suggestive tone of voice: 'Pray, don't move.'

'I ain't a-goin' to, Tommy,' is the unwelcome reply. 'I don't budge from this 'ere seat till you've 'ad yer vittles, old man. So just set down an' peg away, an' don't mind me.'

As it is impossible to demur to the self-abnegating generosity of this determination, the Chairman has no recourse but to sit down and hastily swallow his dinner and his vexation at a small side-table.

When dinner is finished, the tables cleared, and the legitimate Chairman fully installed in possession of his rights, the business of the evening begins. The annual dinner has been chosen as the occasion for presenting the Secretary of the Society with an illuminated Address, in recognition of his invaluable services. The Chairman, a sprucely attired man, with a painful affectation of East End gentility, rises and calls out: 'Gentlemen, will you please 'ave the goodness to order what you will 'ave; and then, gentlemen, when you 'ave all charged your glasses, we will proceed to bizness.'

For a few minutes the waiters are busily engaged in supplying each man with his favourite liquor. Gin and brandy appear to be most in request; while a few individuals, after some little hesitation, decide to indulge in sherry; but lest there should be a misapprehension on the part of the waiter, they particularly impress upon his mind the fact that the beverage in which they desire to luxuriate is 'sherry wine.'

The usual loyal toasts being disposed of, the Chairman commences as follows: 'Gentlemen—an' I wish I could say Ladies; but, as you all know, the fair sex is not admitted to these convivial meetin's—Gentlemen, we 'ave now met to take upon ourselves one of the most pleasin' duties which 'as fallen to our lot since my connection with this Serciety. Me an' your Directors 'ave long thought the time was come when it would not be amiss to present our valued and esteemed Secretary with some trifling token of our regard for the services which 'e 'as so long rendered to this Serciety. Ahem! We are all of us aware 'ow much we 'ave to thank Mr Twaddles for. But perhaps, gentlemen, some of you may not know, as I do, 'ow often our Secretary 'as torn himself away from the 'appiness of 'is domestic 'earth, in order to attend to the interests of us 'ere.'

At this instance of stoical devotion to duty on the part of Mr Twaddles, some of the younger guests set up a loud titter, which is immediately suppressed with indignant cries of 'Horder, horder!'

'It is not my intention, gentlemen,' continues the Chairman, 'to enlarge on the merits of Mr Twaddles, which all of you 'ave 'ad so many opportunities of judgin' for yourselves; but this I will say, gentlemen, that great as 'ave bin the services of Mr Twaddles, I think we of the Kosmos Building Serciety know 'ow to afford 'im addikate remuneration for the same. Most of you know the character of the testimonial which we are to 'ave the pleasure of presentin' 'im to-night; but when I tell you that the bit o' vellum, together with the frame in which it is set, cost something like a matter of seven pund ten shillin', to say nothink at all o' the odd pence,

I think as you will agree with me that the testimonial is in all respects worthy of the man. To cut a long tale short, gentlemen, my friend Mr Stubbins will now proceed to read you the Address, which 'as bin illuminated on the vellum.'

Mr Stubbins, the gentleman who, at an earlier stage of the proceedings, had been addressed as 'Ginger,' stands up and takes the illuminated Address in his hand. The varied emotions inspired by the occasion, however, prove too much for this gentleman's equilibrium. He sways unsteadily about for a few moments; and then the Chairman, perceiving that he is beginning to read the Address in a thick husky voice, with the writing turned upside down, hastily snatches it out of his hand with a polite 'Permit me;' while Mr Stubbins sits down in his chair with a loud 'flop,' and gazes round at the company with an air of vacant defiance.

The Chairman then in a mellifluous voice reads the contents of the 'bit o' vellum,' which sets forth in flowery and euphuistic language the deep sense entertained by the members of the Kosmos Building Society of the manifold and priceless services rendered by its able and indefatigable Secretary. 'Mr Twaddles,' continues the Chairman, turning towards that individual, 'I 'ave now the 'appiness to present you, on the part of the Kosmos Building Serciety, with this 'umble testimony of the value which they attach to your services; an' I'm sure I shall be expressin' the feelin's of ivry person 'ere present when I say as we all 'ope that you an' Mrs Twaddles may long be spared to enjoy the same, an' also to 'and it down as an heirloom to your children's children.—Gentlemen,' he proceeds, turning once more to the company, 'I could say more on this occasion, but I won't. There's other speakers as 'as got to come after me, an' therefore I will no longer detain you from the 'appiness of 'earin' them as I know you would much rayther listen to.'

When the applause called forth by this ingenuous burst of modesty has somewhat subsided, Mr Twaddles rises to acknowledge the gift. His appearance is the signal for a rapturous stamping of feet and jingling of glasses, in the midst of which an old gentleman, who evidently deeply sympathises with the Secretary in this trying moment of his life, calls out in a warning voice: 'Keep yer 'ead straight, Twaddles, old boy.' Without apparently heeding this friendly well-meant piece of advice, Mr Twaddles commences: 'Mr Chairman an' Gentlemen, this is indeed the proudest moment of my life; an' I now feel as I'm more than rewarded for all the labours as I've bin at for this Serciety. I know as there are many Sercieties where the Secretary is not treated 'arf as well as I've always 'ad the 'appiness to be by the Chairman an' Directors of this Serciety, an' I could give you the names of 'em gentlemen, I could indeed; but I always know which side my bread's buttered on, gentlemen, an' I've got much to be thankful for where I am now. From the very bottom of my 'eart, gentlemen, I give you my thanks for your great kindness to me on this occasion, which 'as come so totally unexpected, that I niver knew anythink at all about it till this very evenin', gentlemen, I give you my word. Of course,

gentlemen, after the great favour which you 'ave done me this day, I can 'ardly make so bold as to ask anythink further at your 'ands; an' yet there's one little thing more as I'd willin'ly be indebted to you for, an' that's this: if there's any gentleman 'ere present as knows a friend, or maybe only an acquaintance, as is not connected with a Buildin' Serciety, if he'd only just mention the name of the Kosmos Building Serciety to that gentleman, and then come round an' let me know, I'd drop in an' make a call on 'im any time as 'ud be most convenient. An' if there's any gentleman 'ere as wants to buy 'is 'ouse—why, ivery man had ought to be 'is own lan'-lord, gentlemen—I'm sure our terms to borrowers is as easy an' nice as could be wished; an' if iver we do 'ave to foreclose, gentlemen, well, then, all I can say is as it goes against my grain as nothink iver was like it. Gentlemen, whenever Self an' Mrs Twaddles looks up at this 'ere precious bit o' vellum, as will in futur 'ang just over our front parlour chimley-piece, where ivery person as comes in the room can see it, we shall always think what a blessed thing it was as your humble servant okkipied the position which 'e is now proud to fill.'

After this touching display of post-prandial eloquence, Mr Twaddles sits down with a smile of modest satisfaction irradiating his homely features. Deafening applause follows the conclusion of his speech; and the entire company, waiters and all, combine their joint efforts to give vocal utterance to the unanimous expression of opinion that he (Mr Twaddles) is a jolly good fellow, intimating at the same time that on that point they are prepared to defy contradiction.

When the important business connected with Mr Twaddles has been disposed of, the other toasts follow in rapid succession, the last health to be drunk being that of the Solicitor, to the Society. During the acclamations following the solicitor's health, a gentleman at the other end of the room jumps up and exclaims: 'He hed ought to hev bin in the army, gentlemen, he's sich a good un to charge.' This playfully satirical accusation calls forth roars of laughter, which completely drown the indignant protest of the irate man of law, that his charges 'are strictly mod'rate, and let 'em get the work done cheaper if they can.'

After the healths have been finished, the mirth flows fast and furious; the only person who takes no further part in the merriment being Mr Stubbins, who, no doubt from a praiseworthy feeling of shyness, has long since disappeared from public notice, and is now slumbering peacefully below the table.

At the end of one of the tables at which is seated the humble representative of the press, a small party is kept in a continually bubbling state of mirthfulness at the irresistible humour of a young man with a much turned-up nose and crossed eye, who appears to be the comic spirit of the party. One stout, shrewd-looking elderly man, in particular, keeps exploding into bursts of laughter out of all proportion to the most exaggerated appreciation of the jester's facetiousness; in fact, there seems to be some little occult joke going on, of which he alone is conscious. At last, after a more than usually hearty burst of merriment, the hidden source of

humour makes its appearance. Nudging and winking at his right-hand neighbour, he confides to him in a loud whisper: 'There's our Bill a-carryin' on wi' 'is gimcracks an' 'is tomfoolery; an' 'ere's the reportin' chap a-sittin' close by, a-takin' of it all down, an' a-goin' to print it. O lawk-a-mussy on me!' and he rolls back in his chair and laughs till his white waistcoat heaves and quivers with emotion.

As these manifestations of merriment begin to subside, the thriving young tradesman of quasi-clerical appearance gets up to oblige the company, and in melodious strains expresses his conviction that

When the pigs begin to fly,
Oh! won't the pork be 'igh?
I guess they'll be the funniest birds
As iver wos in the sky.

When he has finished, another gentleman of musical proclivities goes up to the piano. His performance, however, comes to an abrupt conclusion, if, indeed, it can be said to have had a beginning. Music, which has charms to soothe the savage breast, exercises such an unwonted sedative influence in this gentleman's bosom, that after fumbling helplessly about for a few moments, he manifests an inclination to fall asleep with his head on the keyboard.

It now becomes plainly evident that it is high time for the company to break up; and after the usual difficulty with regard to hats, umbrellas, and overcoats, the Kosmos Building Society's symposium came to a close.

WAITING.

Waiting while the shadows gather,
And the sunlight fades away;
While the tender gloaming deepens,
And the golden turns to gray;

Watching while the starlight quivers
Brightly in the heaven above;
I am waiting for her coming,
Waiting, watching for my love.

Listening for the well-known footfall,
And the voice whose loving tone
Sweetly bids me cease my waiting,
Watching, listening for my own.

Lingering still among the shadows,
As they deepen on the beach,
Hearts exchange in sacred stillness
Thoughts that would be soiled by speech.

Thus in perfect love and trusting,
Winged moments pass away;
Till the holy, star-crowned night is
Sweet to us as golden day.

And as tenderly the gloaming
Gathered on the brow of day,
God shall keep her, God shall bless her,
When Life's golden turns to gray.

PRICE 1½d.

THE DOMESTIC-SERVANT DIFFICULTY.

To get good female domestic servants is notoriously one of the difficulties of modern family life. Most ladies who are in housekeeping have at some time experienced great inconvenience through having incompetent or disagreeable servants. We Britons are a home-loving people. In his home, the harassed man of business expects to find peace, rest, and relief from the worries of his daily toil. But frequently the home machinery, instead of running smoothly, is thrown out of gear by some mishap with the servants. Can anything be done to improve our family domestics, or must we for ever be content with merely uttering our complaints over a chronic evil, for which the civilisation of the nineteenth century is unable to provide a remedy?

For all practical purposes, we may dismiss from our minds two classes of mistresses and servants. The lady who keeps many servants, pays them high wages, allows them much liberty, and does not overwork them, is not likely to have great difficulty in procuring and retaining a good staff of household servants. On the other hand, the menials who are ill-treated, underpaid, overworked, and allowed but little time for leisure or 'outings,' will be sure to rebel against this tyranny, and escape from it as soon as they can. The overwhelming majority with whom we have to deal lie between those extremes. Where the work is moderate and the wages are tolerably good, many situations 'go a-begging.' The demand for good servants is greater than the supply. And yet, if we may be allowed to use the illustration, we have plenty of girls—the stuff out of which good servants are manufactured. There are thousands of English, Irish, and Scotch girls, not to mention others, who are not employed in factories or in any public places of business, but who remain at home doing nothing. And the vexatious anomaly is, that although it would be better for themselves, for their parents, and for the general public if these young women were

in domestic service, yet they prefer to be hangers-on at home—'stop-at-home girls'—rather than go out and earn their living. A remedy for this state of things ought to be found. With multitudes of healthy girls, we have good raw material in abundance; surely we ought to be able to find the skill and machinery necessary to turn out as finished, that very valuable article, a good domestic servant. Good, honest, clever, respectable female servants are almost invaluable persons in a family; and there are many such; but at present we have not a sufficient number of them, and a considerable portion of those we have are acknowledged to be of an inferior order.

The explanation of, and the remedies suggested for, this modern household difficulty, which from time to time appear in the public papers, are amusingly contradictory. One mistress blames 'over-education' for spoiling servants; while another considers that girls are insufferably stupid and ignorant. One writer suggests that servants think more of a comfortable home than of anything else; another says they are petted and pampered too much. Some urge a rigorous household discipline; while others complain of irritating restrictions. One pleads for a lady being more familiar with her servants; another says that a mistress ought to 'keep her place'—whatever that may mean. Some writers tell us that servants as a class are overworked; others assure us that many of them have so little to do that they waste their time in reading novels, in gossiping, and in looking out of the windows. These Babel tongues only show in what a chaotic state many people's minds are on this subject.

We may notice, however, that all these suggestions indicate something like unanimity on two points—namely, that the relationship between mistresses and servants is not satisfactory; and that an improvement, if not a cure, is possible for the evil complained of. It would lift a load of care from many hearts, and bring sunshine to many homes where there is now shadow, if a

thoroughly good understanding were established between the queen of the household and her domestics, whose conduct to a great extent makes or mars the happiness of family life. To attain this object is worth an effort; and the remedies which have occurred to us are, that there must be more forbearance shown to each other by the classes concerned, and that by some means or other domestic servants must be better taught and trained for their work.

In dealing with the first point we are treading on somewhat delicate ground; still, it may not be amiss to point out a few faults on both sides which might easily be corrected. And here we gladly acknowledge that there are vast numbers of good mistresses and servants to whom the following remarks do not, and are not intended to, apply. There are, however, ladies who make a great deal of unnecessary work for their servants by thoughtless indolence. They will insist on their maids trotting up and down stairs to do the merest trifles. The coal-scuttle is beside their chair, but they will not touch the handle of the shovel to put a few coals on the fire. They will not shut a door, or draw up a window-blind, or light a lamp; but, in the language of the song, they 'ring the bell for Sarah.' Poor Sarah may be so hard worked that she does not know which way to turn; but that does not matter—she must leave more important duties to answer the bell.

There is a great difference between French and English ladies in this respect. As a rule, French ladies do not give their domestics unnecessary trouble; besides, they pay them well and treat them kindly.

Again, some mistresses appear to live in a region of ice, their ideas of caste not allowing them to speak to their servants except to give orders. As a natural consequence, the servant does not look up to such a mistress as a friend, or study her interests, but thinks only of the amount of wages she will get. A great many ladies—who appear to forget that the world keeps jogging on—constantly complain that servants are more difficult to manage, and that they will not do now as they did twenty or thirty years ago. But is it not unreasonable to expect that they should? All classes of the community now live in a different style from what they did in the past generation. If desirable, it is not possible to bring back former times, and wise people leave off crying for the moon. Formerly, a servant-girl had to dress in a certain manner, have no 'followers,' receive few friends, have no leisure hours or nights out, except to attend a place of worship, and certainly dared not presume to have her letters addressed with the prefix 'Miss.' For better or for worse, mistresses must recognise the fact that the times are changed.

On the other hand, it cannot be denied that modern servants have grave faults. Many are disobedient, not to say insolent. They cannot brook having their faults pointed out. They are extravagant and reckless with the property of their employers. The waste in some households is shameful. Some servants prefer to dress in tawdry finery, rather than in clothes suitable for their work and becoming their station. They love gadding about in the streets better than

doing their duty in the family at home. Not unfrequently, servants are wretchedly incompetent. They are foolish, often 'giving notice' for the most trivial reasons. They treat 'Missis'—who is generally their best friend—as if she were their natural enemy. Now, it is evident that so long as those feelings of antagonism exist between the head of the household and her domestics, family life cannot be pleasant. A spirit of mutual forbearance would do much towards improving the relationship of mistresses and servants; it would act like oil poured on the wheels and cogs of some valuable but screeching machinery.

That girls who are intended for domestic service should be better *trained* to their work, has not received, we think, the attention it deserves. We have many institutions whose object is to benefit females; but we have no good system for training domestic servants. We have Girls' Friendly Societies, Servants' Benevolent Institutions, Homes of Hope, Refuges, Female Protection Societies, and so forth; but our great want is some extended organisation by which young girls could be educated in the duties of the household. Our land abounds with various and noble charities; but we should not forget that 'prevention is better than cure,' and that the best form of charity is that which helps people to help themselves.

The girls brought up in Workhouses, in Orphanages, in Reformatories, and similar places, often make poor servants. Those ladies who, through benevolence, have taken such girls into their service have frequently complained in the public papers of their ignorance and general incompetence. This is the more disappointing, from the fact that these charitable institutions are supported by money obtained from the public. A little reflection, however, will convince mistresses that they expect too much when they look for a good supply of competent domestic servants from such places. This is not exactly their work. The objects of these institutions are to teach the children good morals, to feed and clothe them, and to give them a start in general education. In most cases they leave before much knowledge of household duties can be acquired. This is the weak point in our domestic economy. Untaught girls go out to their first situations, and have to scramble into a knowledge of their work as best they can. Clever servants are not made by accident. Cooking is an art to be learned, as much so as playing the piano. And judging from the number of advertisements to be seen constantly in the papers for 'plain cooks,' there are many young women who have not learned the elementary principles of this art.

The same may be said respecting the other duties required of servants. Nursing children or invalids, dusting, cleaning, sewing, arranging the toilets of ladies, waiting at dinner, &c.—all these duties require skill. It is a fact that our best servants come from the families of small farmers, tradesmen, and well-to-do mechanics. And they are superior because they have had a better home-training than those brought up in the haunts of poverty and vice.

What we advocate, then, is that in some way our servants shall be thoroughly instructed to do all kinds of household work. A central

Domestic Servants' Training Home in London, with branches in the provinces, is the organisation which appears to us most likely to accomplish the end in view. It must, of course, at first be a work of charity, taken up by ladies of position throughout the land. The methods of teaching would probably be by holding classes and giving lectures, similar to the methods now adopted by our different Schools of Cookery. In some cases, lessons could be given at home. Such an institution would work in harmony with all our day-schools, supplementing their teaching, and thus making the education of females more complete. Nor need its operations be confined to any particular class; for while its main object would be to train the poorer classes of girls to become good servants, and therefore good wives for those who afterwards would want them, at the same time it might give instruction in those higher branches of knowledge so essential to lady-helps, matrons, housekeepers, and even mistresses.

One very important part of the work of such an institution would be the establishment of night classes and lectures for the convenience of females who are fully employed during the day. Girls at home, in factories, dressmakers, milliners, and others, would thus have an opportunity of acquiring that knowledge of household work which so many of them lack. As already intimated, the direct results of this scheme would be to make good domestic servants and good wives; but the indirect results would be to aid the temperance reformation and to promote thrift.

It is generally acknowledged that one reason why so many working-men prefer the public-house to their own homes is because their wives do not possess the household virtues of cleanliness, neatness, and order. They have not the knack of making home attractive. Hence the husband leaves a comfortless house to seek comfort elsewhere. The question of course will be asked, Is such a national scheme practicable? We will suggest an answer to this question by asking another. In this age, what undertaking is there which is not practicable? But supposing we allow, for the sake of argument, that there are insuperable difficulties in the way of establishing a National Training Home for Domestic Servants, we see no obstacle to prevent something of the kind being attempted on a smaller scale. In any locality, if a few ladies of position formed themselves into a Committee, and energetically took up the subject, they would be sure to have considerable success. Young women, for the sake of advantages to themselves, would be induced to attend the classes and lectures of such societies, and the working expenses need not be heavy. The Metropolitan Association for Befriending Young Servants, 14 Grosvenor Road, Westminster, is something like what we are advocating. That Institution is doing an excellent work among the friendless, ignorant, intractable, young girls of London. Its funds deserve to be more liberally supported, so that its beneficent operations might be extended all over the country.

In nearly every town in the kingdom there are hundreds or thousands of girls growing up who are ignorant of, and incompetent to perform the duties of an ordinary household. We should like to see those now helpless girls taught and trained to be good domestic servants. Plenty

of situations with good wages are awaiting them. They need not emigrate to find them. On the other hand, by making good servants, we should be lessening a social evil, and removing that irritating friction which is constantly grinding away the peace of our family life.

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

CHAPTER XX.—'VALENTINE STRANGE, I WANT TO SPEAK TO YOU.'

CONSTANCE was staying with Mr Jolly's maiden sister, who lived in a small house at a large rental in Chesterfield Street, Mayfair; and thither Reginald drove before dinner that evening, resolved on what should seem a call of duty on the maiden aunt. To his profound amazement, he found Strange there, settled apparently as a friend of the household. He glared at him with unveiled surprise, and Val himself looked almost as guilty as he felt. 'Why, what,' cried the startled new-comer, 'in the name of all the wonders, brings you here?'

'Reginald!' said the maiden aunt, with some severity.

'Don't be alarmed, my dear,' said Reginald in response. 'Strange and I are old friends.' He kissed the withered cheek dutifully, as he had always done, and nodded at Constance. He was himself again.

'How is papa?' inquired Constance.

'Drowned, drowned, drowned, as the Queen in *Hamlet* says,' returned the flippant young man; and proceeded to relate the little episode of the morning. His eyes wandered from Strange to Constance, and from Constance to Strange, and he watched and speculated as he chattered. The mere insertion of his eyeglass seemed to lend him a certain sublime stoniness of visage. He watched everything in seeming to watch nothing; and being a born diplomatist, he abstracted himself gradually from Strange and Constance, and gave himself wholly over to the amusement of the old lady. But, for whatever reason, the two made no sign, and seemed, indeed, even a little bored with each other, and aware of the world. Reginald, confident in the freedom he could take, determined to sit out the term of Val's visit, and having accomplished that feat, and driven Strange into rising, he also arose.

'We'll go together,' he said quietly.

*Val, being unable to find a reason for sitting down again, abused himself inwardly for not having exercised another minute's patience; not guessing that in that cause, Reginald would have willingly sat there for a week. Unimpressible, and even stupid as he contrived to look behind his glass, the little man noted everything. In Strange's farewell to Constance there was something of an appeal, a touch so fine, that the best of actors would have been put to it to copy the manner of it. Constance's manner was chilly; but her bosom gave one long heave, and she paled and trembled ever so little as she said good-bye and gave him her hand. These signs were so delicate in themselves, that I have in expressing them a sort of feeling that I exaggerate them; but the keen though vacuous-looking eye

behind the eyeglass took in all, and the youth made his own conclusions.

'Valentine Strange,' he said, pausing in the street a few seconds later, and tapping his friend lightly on the breast, 'I want to speak to you.'

Val looked at him quietly. 'What is it?'

'Come with me to your own rooms,' said Reginald. 'We can be quiet there.'

Val, with a little sinking at the heart, foreboding what was coming, nodded in assent; and having summoned a hansom, they were trundled along with scarcely a word between them.

'Now,' said Strange, turning upon him when his rooms were reached, 'what is it?' The air was dusky, but there was a fire aglow upon the hearth by which the two could read each other's faces.

'Got any baccy?' asked the younger.—'Thank you.' He chose a pipe from the rack above the mantel-piece, and having filled and lit it, sat down gravely and smoked, with both hands stretched out to the red gleam of the fire.

'What is it?' Strange asked again, this time with some impatience.

'You remember kicking Davis in the Fives Court?' asked Reginald with apparent irrelevance.

'Yes,' said Strange, breathing tightly, and not knowing what to make of this beginning. 'What about it?'

'Remember the fight that came after it?'

'Perfectly,' said Val, trying to laugh, and not succeeding very brilliantly.

'Remember what it was all about?'

'Certainly. What of it?'

'You did me a royal good turn that day,' said Reginald. 'It's twelve years ago, ain't it? We've been close chums ever since that time, haven't we, Val? And that was the beginning of it. Very well. You've always been stronger and richer and luckier and handsomer than me, haven't you? Very well, again.'

'You have not been drinking, have you?' asked Strange.

'Half a pint of claret at luncheon,' said the little man, with his eyes on the red glow of the fire. 'We've been chums for twelve years. You began by licking an enemy of mine, and you've gone on with all manner of kindnesses ever since. And now I'm going to show my gratitude. You're not the Valentine Strange you used to be. There's something on your mind. Will you tell me what it is, Val, or shall I tell you?'—Strange sat in silence.—'Remember, Val,' said his companion, lifting his gaze from the fire and looking full in Val's eyes across the semi-darkness of the place, 'this is the first chance of doing you a turn, I've had. I give you notice that I'm going to take it—mercilessly.'

'That half-pint,' said Val, 'was longer or stronger than common. Have a nap.'

'Am I to tell you what it is?' asked Reginald, with no alteration in his tone, and with his eyes still fixed on his companion; 'or will you tell me?'

'Oh!' cried Val, in a tone of easy impatience and derision, 'let us have it. Let me get a light.—And now, go ahead. I'm waiting.' He threw both legs over the arm of his chair, and slipped back, so that his face fell into darkness.

In answer to this movement, the little man arose and lit the gas before he spoke another word.

Strange came uneasily back into his former posture. 'Confound your mystery!' he cried. 'What have you to say?'

'I have something to say,' returned the other, 'that I don't want to say. Something I tremendously dislike to say. Something I must say, unless you'll say it for me.'—Strange's only answer was to cast his hands resignedly abroad. Reginald stood upon the hearthrug before him, and had the advantage, unusual with him, of looking at Strange from a superior height. It is remarkable how that tells in a discussion—with some people.—'Now, will you tell me, Val—you, an honourable man—will you tell me on your word of honour that you have no guess of what I mean?'

'You little lunatic,' said Strange, with an affectation of good-humoured raillery, 'how *should* I tell?'

'Val,' said the little man feelingly, 'you don't know how much I know.'—At that, Strange started and turned pale. Was it possible that Constance, dreading herself, had besought her brother's interference.—'Suppose,' the little man continued, 'that I had met your friend Gilbert—East?' He threw just a trifle of malice into the pause, for he was angry with Strange for that deception. Strange moved again, and blushed. This was turning the attack altogether, and though the shaft hit him smartly, he could bear it. If the letter to Gilbert were all the mystery, he thought he could make his peace. 'Suppose,' Reginald went on, 'that I had put two and two together, with a result confirmed again this afternoon? Val, for pity's sake, don't make me fool about in this way any longer. Tell me you understand me.'

'Well,' said Val suddenly, with a desperate voice and a face of pallor, 'I understand you. Go on.'

'Thank you,' said the accuser, holding out his hand.—Strange took it and pressed it hard, though he hung his head.—'That's like you, Val. That's honest. I'm very sorry, very sorry, sorrier than I can say. But you're too late, Val. And you're a man of honour, and I'm a man of honour. And—he's a friend of yours too, Val. Now, it's all over, isn't it?'

'Rags, old man,' groaned Val, still holding his hand, and speaking with his head still bent, 'she doesn't care for him!—not a straw!'

The little man gripped Val's hand harder as he responded: 'We're both men of honour, and we're friends, Val—friends. We can't have her talked about. The other man's in his right. She took him with her eyes open, and you came too late. You came in last. Well, you'll find another race that'll be better worth winning in.'—There was no answer to this, except a groan and a harder grip of the hand.—'Faithful are the wounds of a friend,' said Reginald; 'but the kisses of an enemy are deceitful. Run away from it. That's the best thing you can do. Make a bolt—at once.'

'Yes,' said Val, stricken to the heart, 'I'll go.—But,' he added, lifting his head and showing a face so changed, that his companion was amazed and half frightened by it, 'it will be as hard

for'— He checked himself there, but the tone told all.

'The more need to go, if that's the case,' said Reginald, hardening himself. 'Honour! Val, honour!'

'I know it will be,' cried Val, rising and casting his arms upon the mantel-piece. He looked round with haggard eyes. 'I know it!' he cried again, and dropped his head upon his arms.

'How do you know it?' asked the other, almost sternly. 'Val! you haven't—spoken to her?'

'What do you think of me?' cried the miserable Val, not daring to confess. 'But I know it.'

'I've never been hit in this way,' said the young philosopher, laying a friendly hand on Strange's shoulder; 'but I suppose I shall take pot-luck with the others when the time comes. And if men and books speak the truth, the only courage is to run away, in such a case as this. Start at once. Go to Naples.'

'I'm sick of Naples,' said Val, raising his head drearily. 'But I'll get away somewhere, and I'll catch the tidal train to-night. Will you—will you say I'm gone?'

'Yes,' answered Reginald, moved by his friend's trouble. 'And Strange, look here! Stop away till it's all over. There's a good fellow. We shall have you back as jolly as a sand-boy in a few months' time. And I'll tell you what we'll do. We'll go to Bassano's and have a room to ourselves, and dine together, and I'll see you off.'

'Do you want to watch me?' asked Val bitterly.

'That's not like you,' said the little man, reaching up and putting a hand on each of his friend's shoulders. 'I want to cheer you up a bit.'

Strange rang his bell, and ordered his servant to pack for the continent and book for Southampton. 'I'll go there to-night, and start for somewhere,' he said recklessly. 'Come on. Let's to dinner.' He rattled away in an almost hysterical fashion until the time for parting came. But when Reginald had shaken hands with him, as the train moved from the platform, and had withdrawn his hand, he felt that there were tears upon it.

(To be continued.)

INDIAN FOREST-NOTES.

I.—THE MONKEYS AND THE TIGER.

MONKEYS in their wild state are subject to many chances and vicissitudes, of which little is known save to those who have had opportunities of studying their habits and mode of life in forests and jungles. Gregarious, with the exception of a very few species, they abide in one locality as long as food and security are assured; but lack of the one or loss of the other often causes the disintegration and dispersion of a tribe or colony, so that it is not unusual to come across two or three individuals by themselves; and on such occasions it is reasonable to conclude that a tribe has met with some adverse vicissitude, that these wanderers were once the members of a considerable body, and that they in all probability now form the nucleus of what at some future date may become

again a formidable family. Of all the species found in India proper—and the monkey race is somewhat largely represented there—the greenish-gray variety (*Macacus rhesus*) is the most interesting; and its docility, when caught young and reared with care and kindness, is remarkable. Amongst the natives of the North-west Provinces it is known by the name of *bundar*, and shares almost equally with the *Hunumān* (*Semnopithecus entellus*) the veneration of the Hindus.

It was amongst this species I found myself one day, on my arrival at my tent on the banks of the river Kuriālli, in Upper India; and on inquiry I ascertained that a belt of forest at least twenty miles in length and three in breadth, bordering on the river, was inhabited by countless families of these creatures. Each family, consisting often of as many as thirty members, strictly retained its own individuality, and confined itself to a fixed area, where it roamed during the day and slept at night. From dawn till sunset each troop searched for seeds, fruit, and the roots of edible plants, jealously guarded by its gray-bearded patriarch; and it was amusing to watch the anxiety displayed by this individual, if by chance his family came into too close proximity with that of another. Nor was it an unusual occurrence to see the elderly heads of families engaged in a 'battle-royal,' vehemently claiming some too coquettish lady-monkey, who in the fierce heat of the combat generally escaped, in a more or less dilapidated condition, and with extraordinary agility returned to her own tribe, only, however, to be chased about and bullied by her more demure and circumspect relations.

Monkeys in general, and the above species in particular, entertain the greatest antipathy to tigers and leopards; nor is this to be wondered at, for it is these animals only that attempt to molest them; indeed, by the former, monkey-meat is considered a high delicacy. When, therefore, their domain is invaded by the stealthy tiger, and his whereabouts detected, the violence of their anger knows no bounds. High up out of the reach of their foe, they give free vent to their enmity, and with prodigious chatter assemble in all their strength upon the trees beneath which the tiger is lurking; shaking the branches with might and main, and pattering down upon and about their would-be devourer such a shower of dry sticks, twigs, and leaves, that the latter is forced, with an angry growl, to quit his lair and seek other and quieter quarters. But no peace is he allowed so long as he remains in their vicinity; and should darkness set in, these sagacious animals will, on the ensuing morning, search diligently, to see whether or not their enemy has really taken his departure.

Illustrative of this antipathy, a very strange incident came under my notice. After I had been encamped a week or so on the Kuriālli, I was informed that there had been for some days past, and still was, a most unusual commotion existing among a large tribe of monkeys in a distant part of the forest, and that it must be occasioned by the persistent presence of a tiger or leopard in their immediate neighbourhood. From my previous knowledge of the habits of monkeys, I was aware that they treated other animals, such as wild-pig, deer, &c.,

with perfect indifference, and what the natives represented was probably the real clue to the state of frenzy the creatures were reported to be in. Unfortunately, I had no elephant with me on which I could with perfect safety venture to explore the place in question, which was in the very heart of the forest, and overrun with a dense undergrowth of bushes, &c. I was determined, however, to do the best I could; so, taking a thoroughly reliable gun-bearer to carry my second rifle, I set out for the scene of the commotion.

After a while, we arrived within a comparatively short distance of the spot, where a vast concourse of monkeys, chattering and screaming, created an almost deafening clamour, as they bounded and scrambled up and down some trees clustered close together. I knew the risk I incurred in the hazardous undertaking of walking up to a tiger or leopard under such disadvantageous circumstances; in truth, the very nature of the excitement depicted on the faces of the monkeys, which from time to time I carefully noted through a powerful binocular, warned me of the description of animal that stirred their wrath. Moreover, as the air was tainted by odour and free from the presence of wheeling vultures, I felt convinced that the object of their dread was alive, hence my progress became slow and cautious to a degree; yet all the time I felt puzzled to explain why the animal remained in one spot, worried as it undoubtedly must be by the continuous shrieking of a host of monkeys overhead.

Gradually my companion and I approached to within fifty yards of the excited throng; then I became reluctant to proceed farther without again thoroughly reconnoitring the situation. With considerable difficulty I hoisted the native—a lithe, spare man—so that he was able to seize hold of the branch of a tree and swing himself into a commanding position, whence, with the aid of my glasses, he endeavoured to ascertain what was really the matter. The fellow had hardly been on the bough a minute, when he slid swiftly to the ground.

‘Come along, sir,’ he exclaimed; ‘it is dead.’

‘What is it?’ I asked eagerly.

But the native was moving ahead rapidly through the jungle, and though I followed close on his heels, his reply was lost in the terrible uproar the monkeys were making. I was therefore quite unprepared for the strange sight that in a few seconds met my eyes. A full-grown tiger had jammed himself inextricably between two stout *sāl* saplings that sprang from the same root, and widened, so that at the point where he was caught at the waist and pinned, they seemed not more than six inches apart, and perhaps five feet from the ground. The animal was quite dead, and, by his emaciated condition, had evidently succumbed to slow starvation.

Of course it is impossible to describe the exact process by which the tiger got himself into this extraordinary predicament; but the following is, to all appearances, a very likely solution. In the first instance, he must have invaded the domain of the monkeys, and in return been constantly harassed by them for some days. Finally, some monkey more daring and malevolent than his brethren, must have come a

considerable distance down one of the saplings, to vex and annoy the tiger still further; and the latter, believing he saw a chance of gratifying his resentment, and at the same time satisfying his appetite with a choice morsel, very probably made a spring at him, which Jacko probably neatly avoided. But his antagonist had proved less fortunate, and had evidently fallen between the two smooth saplings, and been caught in their embrace; and the more desperately he struggled in his efforts to release himself, the lower he sank into the fork, and the tighter and more unyielding grew the grip of the stems. Thus inextricably wedged in, harried by countless hordes of shrieking monkeys, racked by hunger, tortured by thirst, the unfortunate beast had remained imprisoned till death relieved him of his sufferings.

II.—MONKEYS MIGRATING.

Some three weeks or more after the incidents recorded above, I observed that great multitudes of monkeys began to occupy the trees which grew along the margin of the Kurialli River. By degrees the interior of the forest became entirely deserted. Then for the first time I learned that an annual migration took place, owing to the lack of food in the forest at this season of the year; for every edible particle had been searched out and devoured by these intelligent and, in this respect, industrious creatures. Yet I could hardly believe they meditated crossing the wide river; for wide it comparatively was even at this its narrowest part, where the monkeys were congregating in such vast numbers.

This information I derived from a semi-nude, wandering *jogee* or Hindu devotee, who, to the practice of mendicancy, added what he was pleased to term the science of astrology; and for the most part obtained a subsistence by working on the credulity of his fellow-countrymen.

‘I have roamed these forest tracts for many years,’ he said in answer to a question of mine, ‘and I am bound to be present when these my children’—pointing to the throngs of monkeys—‘cross the Kurialli, for they will need my services.’

‘Indeed,’ I replied. ‘Pray, tell me in what way you propose to help them.’ For I naturally concluded that, during his long residence in the jungles, living as it were with wild animals for his neighbours and constant visitors, circumstances in connection with them must have come under his notice, likely to prove both interesting and curious.

‘I will with pleasure, sir,’ responded the native. ‘You are aware there is just now a dearth in the land my children inhabit. This will continue for the space of two months, that is, till the rains set in; then the roots of the plants, &c. on which they thrive will again become plentiful. In the meantime, those that can get safely across the river will find food on that sandy expanse that you see in the distance covered with low thorny bushes, which at this period produce in perfection the sweet-tasted *bher-berries*.’

‘But you have not told me how you will assist such vast numbers,’ I remarked. ‘I feel sure many will be drowned.’

‘A few will no doubt lose their lives,’ answered

the man, 'for the river is swarming with alligators, who appear to know that my children are collecting on the banks, and are in hopes of snapping up some of them when they go down to drink. But as a matter of fact, the poor creatures are only waiting for my permission to cross. I will direct them to do so as soon as I have ascertained a propitious moment, one in which nearly all the alligators will be asleep; and they will thus be able to swim to the other side in comparative safety.'

'You are really a remarkable man,' I said, somewhat ironically. 'Perhaps you will kindly let me know when you intend giving this signal, as I should very much like to watch so extraordinary a spectacle. Buksheesh, too, for yourself will be forthcoming.'

'I shall be sure to inform your honour,' replied my sable friend with much politeness; and with that he stalked importantly away.

It was probable that in bygone years the wily devotee had witnessed at least a dozen such crossings; hence it seemed to me very likely that, by accurately observing certain signs and indications in the behaviour of the monkeys, he was able to tell to a nicety the exact moment the creatures would enter the water. Using this knowledge for his own glorification, he pretended to be gifted with preternatural powers; and I had but little doubt that the ignorant and superstitious natives who lived in the vicinity were thoroughly impressed with the idea that the migration took place under his immediate superintendence and at his express word of command.

Next morning, just as the first streaks of dawn were reddening the sky, I was roused from my slumbers by a strident voice calling out, 'Sahib, sahib!'

'What is the matter?' I exclaimed, somewhat drowsily and unamiably.

'In about a quarter of an hour I shall give my children the signal to cross. If you wish to witness the scene, you must make haste.'

In the above sentences I recognised the accents of my friend of the previous day. Springing out of bed, I dressed as quickly as I could. Very soon I emerged from my tent, and made my way to the river-bank, which was about one hundred yards or so distant.

The old devotee, full of importance, was standing on the margin with a dozen natives around him. As I approached, raising his arm impressively, he pointed hither and thither for my edification; and truly the sight was an amazing one. Lining the bank of the river for nearly half a mile on each side of me, and squatting along its edge, were thousands and thousands of uncanny-looking brown imps, varying in size from the full-grown and bearded patriarchs of families, to the tiniest of youngsters. Moreover, in the motions and gesticulations of these monkeys, I could detect symptoms of an intense, though apparently suppressed excitement. It was evident they were contemplating a step which they regarded as one of supreme moment to themselves. From the monkeys my gaze next wandered back to the mendicant. He was eyeing his children—as he called them—very intently, and with a look full of eager expectation. Then my glance turned towards the river. A thin light mist lay on the

surface of the water, which, being narrowest at this particular spot, was rather deep, and ran with a fair current. I was trying to see if I could detect any stray alligators on the *qui-vive*, when the loud voice of the old devotee once more rose in the air.

'Jump in, my children—jump!' he shouted, taxing his lungs to their utmost capacity; and sure enough, as though in obedience to his word of command, the long, crowded line of monkeys sprang almost simultaneously into the stream. The continuous splash they created resounded up and down the river like the roar of an Atlantic breaker on a pebbly shore. Then the next instant a myriad brown arms were seen whirling in the air like so many miniature windmills in full swing—the monkey method of swimming being somewhat similar to what we term the 'hand-over-hand' style.

At starting, their progress was fairly rapid, and they kept well together; but soon the pace diminished, and the weaker animals began to lag behind. Then a new and painful interest was added to the scene; the alligators seemed to become aware that something unusual was transpiring in the element they considered peculiarly their own, and the river suddenly became alive with them. Every here and there, first was seen a ripple, raised by the rush of one of these reptiles below the surface of the water, towards a struggling monkey; then a sharp anguished squeal followed as the victim vanished almost instantaneously, having been jerked under by some voracious monster; finally, the observant eye could detect a crimson stain rise to the surface, which, however, speedily mingled with the turbid current and disappeared.

Many victims must have perished in this manner; but of course the main body at length reached the opposite shore, evidently in a very weak and distressed condition, as most of them with difficulty dragged themselves up on to the low bank and out of the reach of the jaws of their hideous foes.

Of course the same painful ordeal would have to be undergone by these unfortunate creatures when the berries on the further bank became exhausted, and hunger compelled them to face renewed loss, by once more swimming back to the forest.

THE MORTLAKE PEERAGE.

CHAPTER III.—CONCLUSION.

In this narrative, as in real life, there must be times when nothing of importance occurs. It was so for some time after the events which I have narrated. In the meantime, my young protégé was making rapid advance in his education. I never came across a more amiable or intelligent lad. As soon as I had rubbed off what I may call his nautical rust, and had coached him a little in mathematics and the classics, I sent him to reside with a clergyman who took private pupils; and I was gratified with the reports I received of his character and progress.

Months had elapsed, but I had received no answer from Lord Mortlake. At length there came a communication from his bankers. It

stated that the last that was known of the missing Earl was that he succeeded in crossing the Rocky Mountains, and had entered California; but after this there were no traces of him, and it was supposed that he had been murdered by the Anahuac Indians. My letters had therefore never reached him; and after a time, believing him to be dead, Lord Mortlake's agents forwarded them, with the rest of his effects, to this country.

It was generally believed—and I must confess that I shared the belief—that Lord Mortlake was dead. There was no reason, if he was alive, for his keeping out of the way. At this juncture, the next of kin, one of the Stanhopes of Leicestershire, assumed the title, and was about to take possession of the estates, when I at once instructed my solicitors to put in a claim on the part of my *protégé*.

The case caused a great deal of excitement in the fashionable world; for the boy's identity, as well as his legitimacy, was hotly contested by Mr Stanhope. The fact that the register at Knutsfield had been tampered with, and that a child had died and been buried as the offspring of Mrs Stanhope, together with many other incidents which I thought were only known to myself, had somehow got to the knowledge of his solicitors—how, I could not imagine.

A case like this soon got into the newspapers, and the principal facts were freely commented on. One editor, more bold than the rest, said that doubts were entertained if the ceremony said to have been performed at Knutsfield had any existence except in the excited brain of a rather susceptible clergyman, and in the hallucinations of a woman predisposed to melancholic depressions, and a pronounced somnambulist!

I must confess that all this caused me a great deal of anxiety. I was quite convinced that the lad was the legitimate son of the Earl of Mortlake; I was quite satisfied with the evidence of Mrs Minter and Mrs Moody; but I could not help seeing that there were so many elements of romance and apparent improbability in the case, that I could not expect a judge and jury to look at it in the same light as I did. I knew that there were enormous difficulties in the way of the prosecution of this suit; but nevertheless there was to me a certain amount of fascination about it that led me on; and I felt that whatever might be the obstacles in the way, or whatever might be the costs of the suit, I should eventually prove my *protégé* to be the rightful inheritor of the Earldom of Mortlake.

It was at this epoch that one morning a lady was announced. I say a lady, because she gave no name: the servant was instructed to say that a lady wished to see me. I bade the man usher her into my study.

The lady who entered was tall and finely formed; but she was too closely veiled for me to distinguish her features. As soon as the servant had closed the door, she raised her veil. It was the Countess of Mortlake.

'You are surprised to see me here,' she said. 'I am equally surprised to find myself in your presence. I have been taught, and I believed, that you were my enemy—that you had destroyed the evidence of my marriage, and denied that it had ever been performed. I now know

that all this is false, and I come to ask you to be my friend. I believe that you are an honest man and a gentleman, and I place myself entirely in your hands.'

I replied, that she might do so with perfect safety—that I greatly sympathised with her, and that my only wish was to serve her and her son.

'My son!' she exclaimed with great emotion—'my dear boy, from whom I have been so long separated. Tell me, where is he?'

'He is with a clergyman, who lives near to Whitehaven. He is well and happy, and you shall shortly see him.'

She thanked me warmly; and after I had stated to her some of the circumstances under which I found the boy, as these have been already made known to the reader, I naturally expressed a wish to know something of her own fortunes since the day on which I married her to George Stanhope in the church at Knutsfield.

'Mine,' she replied, 'is a sad story; but I will make it as short as possible.'

'My father,' she said, 'was a stern, unrelenting man; and my mother was just the opposite. She was very kind to me; and it is hard to speak ill of the dead; but in truth she was but a weak woman, and did not influence my mind for any good. At the same time, though my father was a stern, proud man, he was very indulgent to me. I was an only child, and consequently a spoiled one. In a moment of weakness, I contracted, as you know, a marriage without my parents' knowledge or consent. It was not my husband's fault; it was all my own stupidity and folly. He entreated me to let him write to my father, and ask his consent; and even when we were married, he wanted me to write and tell him, and beg his forgiveness. After my mother's death, I was more than ever afraid of my father, and I felt that I dare not acquaint him with it. In due time I informed the Misses Onslow of my situation. They refused to believe my story. I had no certificate of my marriage, and they treated me with great severity; so cruelly indeed, that I was about to risk all and run away, when they discovered my plan, and frustrated it. After that, they treated me better. At this point, I wanted to send for my husband; and intended that he and I should go over to Florence to my father and ask his forgiveness. But this, the Misses Onslow would not listen to; it would ruin the reputation of their school, they said; and they so acted on my fears, that I consented to keep the marriage a secret till I returned to my father. Up to this time, I had been corresponding with my husband, through the agency of one of the servants, and had been receiving letters from him by the same means. By-and-by, however, his letters became less frequent, and at length ceased.'

The lady was here much affected; she buried her face in her handkerchief and sobbed audibly. After a little while, she mastered her emotion, and went on with her narrative. 'I then wrote a long and pathetic letter to my husband; but he never answered it, and at last went to India, and deserted me.'

'Were you really made to believe that he had deserted you?' I asked.

'I was,' she replied. 'But why do you ask such a question?'

'Because you were made to believe a lie; because you were both tricked and deceived.—Read that!' and taking from my desk the bundle of old letters which Miss Onslow had placed in my hands, I handed one of them to her. It was the last one Mr Stanhope had written to his wife before his departure for India.

As she read it, she became dreadfully excited; her bosom heaved, her eyes filled with tears, and broken sobs burst from her. When she had finished, she kissed the letter passionately, exclaiming: 'Thank God! thank God!'

She paced the room rapidly, uttering broken exclamations of thankfulness. Then she turned upon me suddenly, and cried: 'And this letter was kept from me! Oh! this is the very perfection of cruelty! That letter would have saved me years of agony. I knew that those women were base and cruel; but this exceeds my worst opinion of them!'

For a time she was too deeply affected to go on with her narrative. When she had succeeded somewhat in subduing her emotion, she continued:

'After the birth of my child, which, spite of the threats and entreaties of those two horrid women, I had properly christened and named after his father, I was taken very ill, and did not recover for many months. During that time, I believe I was insane. I was never told so; but I am convinced that such was the fact; and during this period the youngest Miss Onslow constituted herself my nurse. When I recovered, I found that my child was dead; or rather, as I now know, I was by a fraud tricked into believing so. Doubts also were thrown upon the validity of my marriage. It was said that the register at Knutsfield had been examined, and that there was no entry of a marriage having been solemnised. I could get no tidings of my husband, nor would they speak with me about him. At length I was considered well enough to return to my father, and accompanied by Miss Onslow, I went to Florence. My father was a proud man, and very anxious that I should make a good marriage; and Miss Onslow knowing this, was always telling me that if my marriage with Stanhope was discovered, he would disown and disinherit me. Miss Onslow still resided with me, nominally as a companion, but in reality as mistress of the establishment. By her arts she gained a great ascendancy over my father, and I believe if he had lived, he would actually have married her.

'The Marquis of Swindon was a constant guest at my father's table, and he was very kind to me. You may imagine, situated as I was, how grateful I was for any scrap of kindness and sympathy. He did not in the ordinary sense make love to me; but he saw that I was unhappy, and he tried to soothe and comfort me. I experienced the greatest consolation in his society. I liked him, but could not of course love him. He asked me, nay, urged me to marry him; but I told him it was impossible—that my affections were engaged. When my father came to know that I had refused him, he gave way to such passion that it brought on a fit of apoplexy, of which he died. He had threatened that he would disinherit me in his will; but he had no time to carry out his threat; and thus I found myself,

as I supposed, free, and possessed of great wealth. As soon as my father was buried and my business affairs arranged, I proposed to start for India in search of my husband, and I told Miss Onslow of my project; but she laughed at it. I tried to get rid of her; but she refused to go. She used all sorts of threats; and as I knew her to be capable of anything that was diabolical and wicked, I let her remain. Shortly after this, she one day brought me an old *Times* newspaper—she said that her sister had accidentally discovered it—and she pointed to the death column, and showed me the name of my husband. As near as I can remember, the announcement ran thus: "STANHOPE—March 16th, at Bombay, after a short illness, GEORGE SPENCER STANHOPE, aged 31."

'After this, I had another long illness. Liberty I had none; and the thralldom in which I lived was more galling than ever. The only real friend I had was the Marquis of Swindon; his kindness affected me deeply, and I longed to tell him the story of my wrongs; but Miss Onslow had acquired such an influence over me, that I dared not.

'To show you the abject state into which they had brought me, I may state that though I knew that during my illness a large part of my income had disappeared, yet I had not the courage to complain, or to ask what had become of it. These facts, all of which are substantially true, will, I think, show you that I have been more sinned against than sinning.'

'What about Miss Onslow? Where is she now?'

'About two years since, she married a cousin of hers, a lawyer. When this took place, I thought that I should get my liberty, and for some months I was left in peace; but I soon found that I had only exchanged masters. This man came to me one day and threatened me. He said I was living before the world as a single woman, that I had had a child, and that unless I gave him a thousand pounds, he would expose me. Money was no object to me, and I weakly consented; and since that, I have been subject to a series of exactions and annoyances which I feared would bring on my old disorder. But I thank God I have been enabled to bear up against it. Still, it has been a sore trial to me.'

'But when your husband returned from India,' I said, 'why did you not communicate with him?'

'I knew nothing of it. I was then in Florence, I suppose.'

'Did you not read of his coming into the title?' I asked.

'No. I was never in those days allowed to see an English newspaper. Besides, I was almost entirely ignorant of my husband's family and connections, and did not know that he had succeeded to an earldom; so much so, that afterwards, when I heard of the supposed death of the Earl of Mortlake, I was not aware that he was in any way related to me.'

We had some further conversation; and then she said suddenly: 'You have not told me how you became possessed of that letter.'

'I got it from the elder Miss Onslow. Previous to her death, she sent for me—she, I am sure, repented of the part she had played in this matter

—and after placing this packet in my hands, was about to make some disclosure; but she died before she could make it.

'Poor thing!' said the Countess, with some feeling. 'I am glad to hear this; for, bad as she was, she was not so bad as that other horrid creature; indeed, I don't think she would have been bad at all, if it had not been for her.—Are those the letters?' she asked, pointing to the packet I still held in my hand.

'Yes,' I replied. 'Would you like to take them home and read them?'

She accepted the offer eagerly; and I gave her the packet of letters, but cautioning her, whatever she did, not to let them go out of her possession, and stipulating that when she had read them, she would return them to me. This promise she gave me, and I dismissed her. The case had assumed an entirely new aspect, and I wanted time for consideration.

The great Mortlake Peerage Case, as the newspapers called it, was set down for hearing. All the leading members of the bar were engaged on one side or the other. The witnesses from Knutsfield and Ramsgate were waiting to be summoned, and it was expected that in a few days the trial would be commenced. The public were greatly excited with regard to its probable termination, and popular feeling ran very high. There were partisans of both sides, and each argued vigorously for his own point of view. At first, public opinion was rather against than in favour of my *protégé*; but the appearance of the Countess, with her son, in deep mourning, excited great sympathy. In short, no sooner did the lady appear upon the scene, than the current of public opinion, which at one time was strongly in favour of the new claimant Mr Stanhope, turned, and was now running as vigorously in the opposite direction. The extreme beauty of the Countess, her great wealth, and the romantic story of her marriage, had great influence with the British public. It was very satisfactory to have the public with me; but those good people, who were very much inclined to make a hero of the young Earl, were not the people who had to decide the case; their opinion would have no influence with either judge or jury. Still, though things looked in a very satisfactory state, and while it was gratifying to me that the truth was beginning to make itself felt, I must confess that it was an anxious time with me. The opposition story was not without point and cogency. They did not charge me or the Countess with an attempt at fraud; they merely said that we had been imposed upon by people more clever than ourselves, who had made us their dupes. They further said that the plot was not of recent origin, but had been conceived many years since; that my *protégé* was not the son of the Earl and Countess of Mortlake, but the offspring of a Sandgate fisherman. It will be easily seen that there was room for these suggestions, and that in the hands of clever counsel much might be made of them.

Matters were in this state, when suddenly, without any warning, the whole case collapsed—burst like a bubble. There was no trial, no

verdict. The woman Onslow and her husband suddenly disappeared from the scene. What brought about this extraordinary state of things was a letter from the Earl of Mortlake, dated from New York, to say that he was alive and well!

From his letter, it appeared that, after crossing the Rocky Mountains, he made his way to the valley of the Rio Puerco, a splendid country, lying between two ridges of the Sierra de los Comanches. It was a spot which was rarely visited by Europeans, and was inhabited by a savage tribe of Indians called the Comanches. For some time he eluded their vigilance; but ultimately he was taken prisoner, and remained in captivity more than a year. Eventually he escaped, reached New York, and finally landed at Liverpool, where I met him and explained everything. We proceeded to London. Lady Mortlake sat in the drawing-room with her son, anxiously waiting our arrival. As soon as she saw her husband, she uttered a cry of joy, and sprang forward to meet him, the whole pure unrestrained joy of her heart beaming upon her face—a face always lovely, but now, in the maturity of her beauty, more lovely than ever.

'My wife!' said the Earl, as he returned her embrace, 'my own dearest wife—long divided, but ever loved! I thank God we meet again, never to separate till death us do part.'

'Amen!' I responded reverently.

'And this is our boy?' he continued, as he kissed the youth, and folded him in his arms.—'And now,' he said, 'let us thank our good and generous friend to whom we owe all this happiness.'

'No, no!' I cried; 'I want no thanks. I have only done my duty.'

'True! and if we all did that, the world would be a paradise.'

My story is ended. The trials and sufferings through which these two had passed were not without their effect, but happily it was a beneficial one. The Countess, whose heart had hitherto known only endurance, was now filled with an exuberance of joy. She found in her son and husband a vent for all the deep and passionate longings of her soul.

As for the Earl, sorrow, anxiety, and privation had not altered his generous nature or daunted his fine spirit, though it had made him more grave and thoughtful than of yore; but that did not render him less amiable in the eyes of her who, through all the vicissitudes of her eventful life, had ever been faithful and true.

Let us now leave them as they sat, with hand clasped in hand, happy once more in each other's love.

SIMPLE FACTS CONCERNING WATER.

BY AN ANALYST.

AN elementary body is a substance out of which it is impossible to take, by any known means, two dissimilar substances. At one time, water was considered to be an elementary body. In the scientific light of the present time, we know this to have been a mistake. At the time referred to, it was believed that there existed only four elements—namely, earth, air, fire, and water; now we have discovered more than sixty

elementary bodies, whose names may be found in any chemistry text-book. Water abounds everywhere. It is seen in its most sublime and majestic form in the sea; the atmosphere is full of it, as the result of evaporation; it is also the chief constituent of the human body. In its vapoury form it bathes the crest of the mountain; and forming in the valley as dew, it is to be seen condensed on the blades of grass like diamonds in the morning sunshine. If our sage and well-intentioned forefathers were wrong in asserting that water is an elementary body, what, then, is it?

Many men with unmistakable claims to intelligence need not be ashamed to admit that they are not aware that water—a substance that can be both seen and felt—is produced by the union of two invisible gases; yet such is the case. To the student versed in chemical science, the evolving, apparently out of nothing at all, of tangible substances is a result he quite looks for. The two invisible gases of which water is composed are hydrogen and oxygen. This scientific truth ought to be known to everybody. When metallic bodies combine with oxygen, they are said to rust. For example, metallic iron, when it combines with oxygen, as the result of exposure in air or water—which both contain *free* oxygen gas—quickly loses its fine grayish-white metallic lustre, and becomes reddish brown. It has rusted; it has combined with the oxygen gas; and so much of the iron is no longer in the state of simple or 'elementary' iron, but has become an oxide of iron—that is, a 'compound' of iron and oxygen.

With the aid of an electric spark, hydrogen, when brought in contact with oxygen, at once fraternises with it, in a noisy and demonstrative manner—the two entering into a most friendly attachment, which is not easily severed; and the result of this union is water. So that every time we drink a glass of water, our stomachs become the recipients of a glass of oxidised hydrogen. There is a law in nature regarding the chemical union of matter, solid, liquid, or gaseous, of a very wonderful kind, which is, that all bodies on entering into chemical combination with one another, no matter in what form they may meet or in what quantity, do so in a certain unvarying proportion, and none other; and this is known as the law of the union of atoms. The great expounder of this theory was Dalton. But how can it be established that water is *not* an elementary body? In this manner: If a voltaic current be transmitted through it, and the gases at the positive and negative poles be collected in jars, and examined, the former will be found to consist of oxygen, and the latter of hydrogen; or if a red-hot piece of platinum is plunged into it, water at once undergoes decomposition; and if the proper means be taken to collect the vapours arising from this treatment, they will be found, on chemical examination, to be no longer water, but to consist of two gases—namely, hydrogen and oxygen; and thus it is known that water is not an elementary but a compound body. A similar decomposition can be effected by placing a bar of red-hot iron in water, with this difference, that the hydrogen only is set free, the oxygen combining with the iron to form a complicated oxide of iron.

Hydrogen—the lightest fluid known—expressed as one, is the standard by which the atomic weights of all the other elements are compared. Now, taking hydrogen as one, oxygen is sixteen, being this number of times heavier. Two volumes of hydrogen require one of oxygen to form water; but one volume of oxygen, as has been stated, is sixteen times heavier than one volume of hydrogen; therefore, two parts by weight of hydrogen and sixteen parts by weight of oxygen, correctly represent the quantities in which these two elements combine to form the liquid called water.

The general law of bodies, solids, liquids, or gases, is to expand when heated. Now, water positively refuses to do anything of the kind between certain ranges of temperature. That range begins at the freezing-point, thirty-two degrees, and terminates at thirty-nine degrees. Between these points there is an increase of seven degrees of heat; but water, instead of following the general law of expansion, turns right about, and contracts, thus becoming denser and consequently heavier. When the river begins to freeze, it does not begin at the bottom, in obedience to this very law. The water on the surface of the river, as the frost approaches, gradually gets cooler and cooler, and as it does so it sinks, in consequence of its increased density, to the bottom; and the warmer water therefrom naturally rises to the surface, and in its turn also gets cooled. This upward and downward movement continues until the whole of the river is reduced to thirty-nine degrees. But observe what takes place now. The water at this point is in its densest state. When it becomes one degree colder—that is, thirty-eight degrees—it becomes lighter, and of course it can no longer sink; and there it remains until it is cooled down to thirty-two degrees—the freezing-point—when a film of ice begins to form on its surface, which of necessity floats.

There are many other curious things that might be said of water, such as its incompressibility, upon which remarkable property depends the power and useful application of our hydraulics; its sudden expansion on becoming ice, bursting not only our water-pipes, but splitting up and disintegrating our rocks and mountains as well; and various other remarkable qualities which space will not permit of being dealt with.

The uses of water are countless. Suppose we look at it for a moment as regards its domestic application. You often hear of water for household purposes being called 'hard' and 'soft.' The reason why some waters, especially spring-water, are 'hard' is owing to the mineral matters dissolved in them. Rain-water is never 'hard,' because it is nearly free of solid matter. The reason you had such an uncomfortable wash and shave this morning at your friend's house, was owing to the water being largely charged with lime and magnesia. When the soap is rubbed between the palms in water of this description, the stearic acid in the oil of the soap combines with the lime and magnesia, and forms compounds which the water cannot dissolve; and hence the provoking curdiness you observed. For the latter to be a perfect one, complete solution of the constituents of the soap must take place, and in pure water this

would be the case. But some waters are permanently hard, whilst some are only temporarily so. Permanent hardness is caused when the water is charged with sulphate of lime and magnesia; and temporary hardness by carbonates of lime and magnesia. Pure water dissolves the sulphates, but not the carbonates. Then how do the carbonates come to be in the water at all? The reason is this. All natural waters, but especially spring and well water, contain more or less free carbonic acid gas in a state of absorption, and when thus charged, are capable of dissolving the carbonates; but whenever this gas is expelled from the water, say by boiling it, the carbonates are at once deposited; and this accounts for the incrustation in the kettle; and when this takes place, the water becomes quite soft. The boiling does not affect the sulphates to any degree in this way in water that is permanently 'hard.' Temporarily hard water can be made soft by more means than boiling alone. If a tubful of it at night be stirred up with a little 'slaked' lime and allowed to settle, in the morning there will be a white deposit at the bottom of the tub, and the water will be found to be quite 'soft;' because the lime added will combine with the free carbonic acid gas in the water, and the whole of the carbonates will become deposited, in virtue of their insolubility in water without this gas.

For drinking purposes, rain-water, after being passed through a charcoal filter, to remove the organic matter it contains, is the most wholesome for adults. The general objection is its tastelessness. A pinch of salt will remedy this. For the young, however, solid matter in the water, of the right kind, such as lime and magnesia, is good, as these go to build up the bony structures of the child.

THE MONTH.

SCIENCE AND ARTS.

THE Naval and Submarine Exhibition, recently held at the Agricultural Hall, London, appears to have been a marked success. Of the seven thousand persons who daily passed within its doors, a large proportion was naturally represented by 'those who go down to the sea in ships.' But the bulk of the visitors were certainly drawn from the general public; a fact not to be wondered at, when we remember what a fascination the broad sea and all that belongs to it have for those whose lives are mostly spent far from its murmur. But from whatever class the casual visitor may have been drawn, he was sure not to regret his shilling fee for admission, for the display contained much that was not only of technical but of general interest.

A huge tank, with glass windows, placed in the middle of the Hall, gave exhibitors of the various diving systems now in use an opportunity of showing how man has learned to make himself an amphibious animal. Here was exemplified the method of diving for sponges or pearls without the aid of any apparatus whatever; and with it was shown the intricate arrangement

of pipes, air-pumps, diving-dresses, and cumbersome helmets, which have until recently been necessary to the preservation of a man out of his natural element. Mr Fleuss's method of diving without these impedimenta was also shown; and judging by the crowds which flocked round when the new system was being demonstrated, we may surmise that the general public take an interest in this new phase of the art of diving. It will be remembered that Mr Fleuss has adapted a modified form of his diving system to an apparatus which will enable a man to enter into gases or irrespirable atmospheres without suffering the least risk. That this invention is no mere ill-conceived toy, which may from its intricate nature break down when wanted for use, may be judged from the valuable aid it rendered lately on the occasion of an accident at Killingworth Colliery, near Newcastle. One of the shafts was under repair, when, without warning, a quantity of timber-work gave way and fell down the shaft, at once stopping communication with the outer world. Unfortunately, the ventilation of the mine was also stopped, with the result that foul air soon began to collect. Eleven poor fellows were confined in this dangerous atmosphere for eighteen hours, after which time, rescuers, equipped with the Fleuss apparatus, arrived upon the scene of operations. In a very short time the suffering miners were restored to their friends, saved from a most terrible fate. In order to show how near all of them were to death, it may be mentioned that one of them subsequently succumbed.

Exhibitions have become so common all the world over since the wonderful success attained by the great show at Hyde Park in 1851, that it seems curious that their popularity has not yet waned. But in case there should be any danger of such a thing, a new kind of Exhibition has been organised, about which, if only because of its novelty, no apprehensions of public apathy need be felt. According to the *Colonies and India* newspaper, Messrs Fry & Co. have announced the startling scheme of an Exhibition which will float from one port to another. A magnificent vessel has been chartered for this purpose, and after being stocked with the produce of different countries, will, early in June, commence a tour of the world of commerce. This way of taking the mountain to Mohammed, instead of asking Mohammed to go to the mountain, is certainly a new departure in trade. The idea is such a good one, and so likely to be beneficial both to this country and our colonies, that we most cordially wish it the success which its ingenious promoters deserve.

As a melancholy contrast to all these advances in the arts of peace, we note in an American paper the description of a new engine of war, which seems to cast into the shade all contrivances for destructive purposes which have yet been invented. This is a gunboat which is a kind of compound of the ironclad and torpedo boat; but the one powerful weapon with which it is furnished is fired not above the water, but seven

feet below the surface. By this means the heaviest ship afloat can be wounded in its most vital part by a submarine shell charged with three hundred and fifty pounds of gun-cotton. The new boat is named *Destroyer*. It is one hundred and thirty feet long, carries a crew of twelve men, will move at a speed of seventeen knots per hour, and is the invention of Captain Ericsson.

The 'cuteness of the American mind is more pleasantly shown in the manner in which iron sheets are now exported from this country for use in the United States. An American Company at Wolverhampton has lately imported shaping and cutting machinery for making coal-shovels, vases, pails, &c., so that when cut and shaped, the iron can be sent across the Atlantic. The object of this is to save the heavy duty upon those parts of the iron sheets—the scrap—which is not actually required in making the articles. The much lower price of the iron on this side of the water, coupled with the saving of the duty in the manner described, makes this enterprise a profitable one. And when we mention that twenty-five tons of iron sheet are utilised in this work at Wolverhampton every week, it will be seen that the scheme must give employment to many.

An interesting pamphlet has been issued by the County of Cork Agricultural Society detailing some experiments on Potato Culture made at the Munster Farm in 1881. These experiments were made with a view to test the productiveness of different varieties of potato-growing under exactly the same conditions, to note their capabilities to resist disease, and lastly to try the merits of different kinds of manures. The variety chosen for the manure experiments was that known as the 'Champion,' and the date of planting was April 12, 1881. The results were as follows: With no manure, the yield per acre amounted to five tons sixteen hundredweight. When an addition per acre was made of two hundredweight of bone and mineral superphosphate, the yield increased by one ton. With four hundredweight of bone-meal to the acre, the yield recorded was ten tons three hundredweight; with kainit alone—two hundredweight to the acre—the yield rose to thirteen tons nineteen hundredweight. The addition of farmyard manure to the soil afforded a yield of thirteen tons fifteen hundredweight; but when the same kind of manure had been stored before use in a closed pit, its energy gave an increased yield of three tons. It must be understood that all these manures were applied to different plots of land of exactly the same size. The importance of these experiments is obvious, and it is thought that they have in great measure influenced the improvement which has been recorded during the past year in the potato crop grown in the south of Ireland.

Our contemporary *Land* calls attention to the circumstance that the Pope is a farmer, and a very successful one too. He does not grow potatoes, nor does he raise stock, but he has large water-farms for the breeding of fish. Into the lagoons of Commachio, where these operations are carried on, the fish come up from the Adriatic in vast quantities. They are there fattened until ready for the table.

The artificial propagation of salmon and other species of fresh-water fish is at length commanding

the attention it deserves. Reared from the egg, and carefully tended and fed during infancy, the fish are in due time liberated from their nursery, and sent forth to stock depleted streams and lakes. We have in this country more than one nursery of the kind, notably the Fishery-works at Howietown, Stirlingshire, founded by Sir James Maitland, which have lately come into prominence in connection with the Scotch Fisheries Exhibition. Here thousands upon thousands of eggs are hatched with such success that only three or four in every thousand fail. The fish when first hatched has a sac attached to it which contains its first food. When this sac disappears, it is fed upon egg, then upon egg and beef grated together. Later on, horse-flesh forms the artificial food, and two, sometimes three dead horses are disposed of every week at Howietown in this manner. As far as possible, Nature is left to herself, and art is only employed where necessary; the chief object of the works being to eschew scientific technicalities, and to deal with the problem of fish-culture so that an ordinary river-keeper can understand what to do and how to do it. 'We have also,' says a contemporary, 'the simple and effective system of Littlewood of Huddersfield, by which, for a small expenditure, any one with a modicum of intelligence could stock any important stream with the most suitable class of fish. The porous earthenware troughs that hatch out the ova are of the cheapest construction, so that a five-pound note can purchase a set sufficient to hatch fifty thousand ova at a time, with ease. A few hours has been sufficient to train a common Highland keeper to use this apparatus with success; and we consider that it virtually solves the question of cheap, effective, and consequently *paying* fish-hatching.' We learn that the promoter of the Howietown establishment was first led to take an interest in fish-culture by an accidental conversation with the late lamented Frank Buckland, whose efforts to preserve our rivers from the pollution of manufactories, deserve the grateful thanks of the community.

The long-vexed question of electric illumination has at length reached such a practical stage, that the text of an Electric Lighting Act introduced by the President of the Board of Trade has been published. The mistake originally made when the gas and water corporations were created, whereby two of the first necessities of life, light and water, have become monopolies which can almost dictate their own terms, has been carefully guarded against in this new Act. Electric Lighting Companies will be licensed for five years only, after which time it will be optional for municipal bodies to buy up the whole plant and to undertake the supply themselves. It is also provided that any Company supplying the current from a central source, shall not have the power to restrict the consumer to any particular form of burner or regulator. In this way the Companies are made the servants of the public, and not their masters.

The near approach of the time when the operation of such an Act of Parliament will become necessary, is foreshadowed by the establishment of the Edison incandescent light on Holborn Viaduct and in various contiguous buildings. The current is furnished from a central office, and is so distributed by wires to the various houses,

that each lamp can be turned off and on by means of a tap without affecting others on the same system. The dynamo machine, the lamps, and all the various details, are the invention of Mr Edison, whose excuse for being somewhat late in the field is his anxiety that everything should work perfectly before being submitted to the public eye. That the system now approaches perfection, must be evident to all. Time alone can tell us about its permanence, and most important of all, its cost as compared with the gas it supersedes. It may be assumed that the gas Companies must at last see that they have a dangerous rival. One London Company has just issued a notice to its customers that it will lend out on hire improved cooking and other gas stoves, patterns of which can be seen at its offices. This speaks for itself.

An attaché of the Chinese Embassy in Paris has just published in one of the French journals a series of articles on the Political and Commercial Aspects of his own country. Perhaps the most interesting portion of these papers is that relating to the various missions which China has sent both to Europe and to America. In 1877, thirty young Chinamen were sent abroad to study engineering. Of these, some were placed in England, some in France, and some in Germany, and after four years' training, returned to their own country. Last year, no fewer than two hundred and sixteen Chinamen, including an Admiral and sixteen officers, were despatched to Western countries to devote themselves to naval studies. At Hartford, United States, there is a Chinese college where two hundred youths receive a liberal education. It will thus be seen that the hunger for knowledge has been felt by those whom we have long been accustomed to regard as barbarians.

Those who eschew the use of meat, and hold that man has no business to call himself a flesh-eating animal, would do well to live in Morocco, for, according to a Report by Mr Payton, our consul there, the country must be a very paradise for vegetarians. Careful cultivation, and a complete system of irrigation applied to the market gardens, have together brought the soil to such perfection, that vegetables and fruits of all kinds flourish most luxuriantly. Potatoes at about a farthing a pound, green peas—from February to May—at four shillings a hundredweight, and walnuts at twopence per hundred, sounds exceedingly tempting.

Many doubts have arisen whether the Channel Tunnel can be made to pay for the gigantic outlay which its construction would entail. The main expense is represented by the constant removal of the debris from the boring-machines. Assuming that the progress made in a thirty-foot tunnel is one yard per hour, the chalk cut away and requiring to be removed would amount to sixty truck-loads, or one per minute. Mr T. R. Crampton long ago devised machinery for meeting this difficulty, and it has been in successful use for some time on a small scale at his brickworks near Sevenoaks. He suggests that the same method should be adopted at the Channel Tunnel works. He proposes that the cutting-machines should be actuated by hydraulic power, by water supplied from above ground. The water, after having done its work, would then, in a proper receptacle, be mixed with the chalk debris,

and form a kind of sludge of the consistence of cream. This liquid mud might then, by means of an ordinary pipe, be carried to the mouth of the shaft, where it could be discharged into the sea, or otherwise disposed of. We should think that there would in a long length of piping be some danger of the chalk gradually depositing itself, and so choking the bore; but this remains to be proved. The idea is an ingenious one, and well worthy of consideration, when we reflect upon the vast saving of labour which its adoption would represent.

Mr Carl Bock, the Eastern explorer, is now in Siam, where he has undertaken a journey for the object of scientific research. Writing in September, he states that although he had received every assistance from the king of Siam, he had many obstacles placed in his way by those who had been deputed to assist him. The natives tried to frighten him by rumours of fevers, evil spirits, and other supposed dangers, and ended by stealing his horse, never dreaming that he would decide to proceed on foot. At one place, an amusing incident occurred, which, however, might have led the explorer into a serious difficulty. A certain chief, who is described as being half naked, blind of one eye, and dreadfully marked with smallpox, allowed his wife to become the traveller's model for a sketch. In the course of his work, he just touched his sitter's chin, as artists will, in order to get a more agreeable pose. Both husband and wife immediately flew into a violent rage at this supposed insult, and the neighbours were called in to eject the intruder. The instant destruction of the sketch was insisted upon. Mr Bock being unwilling to lose it, hit upon the expedient of giving it to the woman alone, and demanded that all her companions should be sent away. While this was being done, he quickly executed a rough duplicate, which the woman quickly tore in pieces, without detecting the ruse which had been played upon her. The results of Mr Bock's travels will be published in book-form by Messrs Sampson Low & Co., but of course this cannot take place until after his return to England in August next.

We learn from a Report published concerning the Hospice on St Gothard, that in the year ending September 1881, nearly sixteen thousand persons received assistance there. Of these, nearly one-fourth were lodged for one night, one hundred and twenty-three had to be treated as invalids, some of whom, suffering from Alpine casualties, were provided with clothing. The need for this refuge on the mountains is considered so great, that it will continue its useful labours even after the tunnel is opened. We are sorry to notice that the expenditure exceeded the receipts last year by nearly four thousand francs. Another Hospice, that of the Great St Bernard, has hitherto had the reputation of being the most elevated inhabited house in Europe. The new Observatory on Mount Etna has robbed it of that distinction, for the latter is one thousand feet higher above the sea-level.

The alterations which are soon to be carried out at the Tower of London will receive the approval of all who have any regard for the monuments of the past. For many years,

the more modern buildings in the fortress have been used as a depository for military stores; and it is found that the woodwork of many of the floors has become so rotten as to be unable to support the weight which they are required to bear. In the meantime, the ancient parts of the Tower defy the ravages of time, and seem to be as strong as when first built. The modern buildings are now to be removed, and certain parts of the old work which they superseded are to be restored. When this work is completed, Londoners will once more see the old place as it was known to their forefathers. But they will have the satisfaction of remembering that the religious intolerance and political intrigues which have stained its walls with the blood of so many just men, have passed away for ever.

BOOK GOSSIP.

It not unfrequently happens that we know less of our contemporaries than we know of the generations that have preceded us. Most people could tell you more about Chaucer and Milton than they can of Tennyson or Mrs Oliphant; and until very recently we knew as little of George Eliot and Thomas Carlyle as we do of Shakespeare or the author of *Piers Plowman*. Any book, therefore, which throws light upon the personal surroundings of our more popular living authors, must always be welcome at many fire-sides. Of this nature is a recent work from the pen of Mr Henry Morley, entitled, *English Literature in the Reign of Victoria* (London: Sampson Low & Co.), and forming the two-thousandth volume of the well-known Tauchnitz Collection of English Authors. The author does not restrict himself entirely to the reign of our present sovereign; he gives by way of introduction a review of English literature from the beginning of the reign of Elizabeth down to that of Victoria. This portion of the work is contained in three chapters, and necessarily deals with this important period in English letters in a somewhat hasty manner. Yet withal, the survey is by one who has a thorough knowledge of his subject, and it forms a fitting prelude to the notices of the authors who have flourished during the present reign. Many of the personal details thus given, though in all cases briefly, are of much interest, and have the fascination which somehow or other belongs to all literature which tells us, in a clever and agreeable manner, something about the more conspicuous men and women of our own day, especially those of them whose works are in our hands, and with whose opinions we may be familiar, while of their personality we know next to nothing. This little work is further rendered interesting by its presenting us with above one hundred and fifty fac-similes of autographs of British authors of the present reign.

Perhaps there is no European country which is so rapidly gaining upon public attention, as is Russia at the present time, both with respect to its political and social development. The fierce spirit of turbulence which from time to time makes itself felt among its vast populations—

now striking at private life, and now at that of the Emperor himself—has resulted in a condition of things which has attracted the attention of many to whom the internal affairs of Russia were previously as unknown and uncared-for as the domestic economy of the Ainos. And this desire for knowledge, this enlightened curiosity, as to things Russian, has been met by the issue of books on almost every conceivable aspect of Russian life. The Germans have been exceedingly active in this work; and a translation of one of their volumes, *Russia Past and Present*, has recently been issued in this country by the Society for Propagating Christian Knowledge. The historical accuracy of the work on which this translation is based, may be estimated by the fact that it has been added to the libraries of all the Russian military seminaries, for the use of the pupils in the higher classes. It treats, in successive chapters, of the early inhabitants of Russia, its formation as an empire, its extent, population, configuration, products, manufactures, climate, and the like. There are also chapters on the government of the country, both in its imperial and local capacities; on the constitution of the army and navy; on the state of trade, commerce, and agriculture; along with a description of the chief towns and chief districts of the country. The religious observances and popular customs described, especially the latter, are many of them very curious; and for those who wish to acquire an intelligent conception of life and government in Russia, we do not know a more agreeable and serviceable volume than this.

OCCASIONAL NOTES.

DISCONNECTION OF TITLES AND LANDS.

It might be expected that the titles borne by our aristocracy would generally be derived from the lands actually held by them; but this, as we learn from a return made by a contemporary, is far from being the case. The Duke of Devonshire, the Marquis of Hertford, the Earl of Derby, and Lord Leicester, have, for instance, not an acre of land in the counties from which their titles emanate. The Duke of Devonshire owns eighty thousand acres in Derbyshire, but none in Devon; Lord Derby has some fifty thousand acres in Lancashire, but nothing in Derby; while Lord Leicester's estates are not in the shire of that name, but in Norfolk, where he has over forty thousand acres. The Duke of Norfolk has but four thousand acres in Norfolk, whilst Sussex and York have some thirty-five thousand acres in his ownership. Earls Carnarvon, Suffolk, Westmoreland, Cardigan, Pembroke, Radnor, and Denbigh, derive their large incomes from counties other than those that give them their titles.

The Marquis of Bristol's estate is in Suffolk; the Marquis of Bath's is in Wiltshire. The Marquis of Salisbury's rent-roll is derived from Herts, and not from Wilts; the Marquis of Hertford derives his from Warwick, and not from Herts; the Marquis of Exeter has nothing in Devonshire; and Lord Southampton's name is absent in Hampshire. The great Duke of Rutland owns but seven hundred acres in Rutland, whilst he is lord over eighty-four thousand acres in six

different counties other than the one from which he derives his title. Notts and Lincoln claim the Duke of St Albans, instead of Herts; and the Duke of Richmond's estates are in Sussex and Scotland, and not in Surrey or Yorkshire. The Duke of Manchester lives in Huntingdon, and does not trouble Lancashire; whilst the Earl of Huntingdon's estates are in Ireland, instead of the English county that bears his name. The Duke of Cleveland would be supposed to draw his enormous income from the Vale of Cleveland, which is in Yorkshire; yet it is not so, his estates being in Durham and Sussex. The Duke of Portland by some is supposed to be the owner of that island in which so many, unwillingly, practically learn the art of building breakwaters and fortifications, and which supplies all England with that beautiful hard stone that bears his name. But the fact is the Duke does not own an acre of land in all Dorsetshire; his immense income being mainly derived from his estates in Notts, Derby, Northumberland, and London. The Marquis of Ailesbury is not known as a landowner in Bucks; Wilts and York having that honour. The Duke of Wellington takes his title from a small town in Somerset, in which county he owns but five hundred and twenty acres, whilst in Hampshire he owns sixteen thousand acres. The Duke of Marlborough takes his title from a small town in Wilts, where his Grace has only one thousand acres, whilst Blenheim, with twenty-two thousand acres of the Duke's property, is in Oxford.

DISCOVERY AS TO PULMONARY CONSUMPTION.

Considerable interest has been caused in medical circles by the publication of an address which was delivered by Dr Koch before the Physiological Society of Berlin, on the 24th of March this year. The address dealt with what is called the Etiology—that is, causes—of Tubercular Disease, under which term is included the terrible scourge of pulmonary consumption; and the experiments therein detailed went to show beyond dispute that the spread of tubercular forms of disease is due to the existence of a minute, rod-shaped parasite, or *bacillus*, only discoverable by the microscope. Dr Koch, who has enunciated this discovery, first made himself known by the cleverness and thoroughness of his researches on the contagion of splenic fever, his investigations in regard to which received such public recognition that the young physician was forthwith transferred from a modest country practice, in the neighbourhood of Breslau, to the post of Government Adviser in the Imperial Health Department of Berlin. He has now done with respect to the disease of consumption what he formerly accomplished in the case of splenic fever. The chief value of the discovery lies in two things—first, that a specific and determinable cause has been found for the various forms of tubercular disease; and next, that this knowledge will enable physicians to proceed in the endeavour to discover whether the disease of consumption cannot be overcome by inoculation, as in the case of smallpox in human beings, and splenic fever in cattle and sheep—both which maladies are likewise due to disease-producing *bacilli*. When Dr Koch had

discovered the parasite that was the active agent in splenic fever, Pasteur in France inaugurated that series of wonderful experiments which went to show satisfactorily that animals inoculated with the virus of splenic fever are protected in this way against renewed attacks of that fever. It is open to be discovered whether mankind cannot be made proof against the fearful malady of consumption by a similar process of inoculation, just as mankind has been rendered proof in the case of smallpox. The further results of the experiments we have alluded to will be watched for with great anxiety, not only by physicians, but by the many who have suffered or are liable to suffer from the terrible ravages of consumption.

OUTSIDE THE BAR.

OUTSIDE the Bar, amid the breaking surges,
By mighty winds capriciously misled;
Toy of the tempest-god who madly urges
The ship towards yon reef that lies ahead;
Beset by Night, whose darkling clouds are driven
Across a sky that shows no friendly star,
With rudder broken, and with canvas riven,
How will she reach her goal within the Bar?

Outside the Bar, like some great soul in sorrow,
The labouring barque bemoans the bitter hour;
And her brave crew, with longings for the morrow,
Toil through the night against the tempest's power.
Ah! can *she* conquer when each giant billow
Has roused itself man's handiwork to mar?
Their angry crests afford no restful pillow
To one who longs for peace within the Bar.

Outside the Bar the storm-fiends, wildly mocking
At human weakness, rave in accents rude;
While in their ruthless grasp the ship is rocking,
A prey to every demon's changeful mood.
The way to port is through those breakers standing
Like foeman-sentinels in time of war,
Their iron-clad and hostile forms commanding
The haven of her hopes within the Bar.

Outside the Bar the ocean-voices thunder,
And Night bends over all her deathly frown:
Within the Bar some tender hearts do wonder
If ships will find their refuge near the town.
Now, for the sake of those our spirits cherish,
Who toss upon tempestuous seas afar,
Pray that the barque beleaguered may not perish,
But anchor safely yet within the Bar.

JESSIE M. E. SAXBY.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. To insure return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. MANUSCRIPTS should bear the author's full *Christian* name, surname, and address, legibly written; and should be written on white (not blue) paper, and on one side of the leaf only.
- 4th. Poetical offerings should invariably be accompanied by a stamped and directed envelope.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

GROWTH OF CAPITAL.

POSSESSORS of small capital complain that they receive less and less from their investments. A generation ago, three or four thousand pounds returned an interest that enabled its owner to live in modest comfort. Now, if it is funded in first-class securities, it yields a mere pittance. And not only does interest tend to decline, but the cost of living tends to increase. When this latter first began to hamper people of small fortune, many sought relief in continental countries where living was cheap. To-day, Switzerland, Germany, France, and Italy are relatively dearer places than England. Save in countries almost barbarous, the expenses of the household are continuously rising. The French *rentier*, the British fundholder, the Swiss house-owner, the American farmer, are all affected by a similar tightening of the financial screw, diverse as their sources of revenue may be. Why is this? Will it continue? In short, what is the prospect before capital?

In discussing this question, it cannot be overlooked that the past half-century has witnessed a commercial and industrial activity so extraordinary, that did we read of it in the history of the Phœnicians, Carthaginians, or other ancient traders, we should deem the recital a wild exaggeration. Living in the midst of this great time, and doing each our individual share to accomplish its marvels, we are to a certain extent blinded to its real magnitude, and unable to comprehend its whole consequences. In the incalculable accumulations of capital, and the strangely varied manner in which its profits are divided, lies the explanation of the reduced returns from investments.

Capital has been fertile as it never was before, because everything has favoured its increase. Business has attained something of scientific exactitude. It loses daily its former aspect of adventure, and its calculations become more strictly based upon facts. Few merchants now ship goods upon mere speculation; the majority supply definite quantities and qualities in accord-

ance with the ascertained state of foreign markets. Importations are similarly controlled. Commodities are bought that will find ready sale. They are not stored in warehouses, as in olden times; the object is to hold little and sell much. Hence, produce and manufactures pass with the least possible delay from importers to consumers, and capital is kept in continual movement.

With a diminution of the hazards that arise from delay and storage deterioration, there have disappeared those greater mercantile risks which made international commerce often as incalculable as *roulette*. From the earliest times down to the age of steamships, pirates levied tariffs upon Neptune's highway. They did more harm by terrifying trade, than by the barbarities and plunder they inflicted upon those who fell into their hands. In cutting for itself a path to the remotest ends of the earth, commerce has made the loneliest parts of the ocean as free from sea-robbers as the Thames and the Mersey. A few are left in Chinese waters; but their depredations grow daily less, and will soon cease. Steam, long-range guns, the consensus of nations, make successful piracy impossible; and the reformed buccaneer, finding that honesty is the best policy on sea, as it is on shore, ranges himself on the side of capital. So with wreckers. These latter were almost as injurious to primitive commerce as pirates. They were even more cruel; for they preyed upon the trade of their fellow-countrymen as remorselessly as upon that of foreigners. At present, the Coast-guard service precludes the possibility of crimes that once were rife on every shore.

Besides destroying predatory men, capital is fettering the savagery of Nature herself. Light-houses gleam on every dangerous point; lifeboats and other apparatus for rescuing imperilled men and treasure, place a chain of safeguards upon the tracks of trade. The arts of ship-building and navigation never cease to advance, and the laws of storms are being slowly yet surely understood. Although the sea is a monster ravening upon capital and human life, its percentage of

mischievous lessens with expanding commerce; and this adds to the growth of wealth and international confidence.

It is to the decline of war, however, that the increase of the world's capital is mostly due. Notwithstanding the frightful military expenditure of the past half-century, and the oppressive burden it yet is to Europeans, the tranquillity of the period is greater than ever was enjoyed before. Military brigandage has been the standing occupation of man during his recorded history. Besides fighting his foes abroad, he has rent his own society by turbulent factions, equally fatal to the growth of capital. But now that human energy is turned from the war-path to paths of peace by the resistless might of universal industry, it follows that creation, not destruction, will be the business of mankind. Instead of capital being annihilated, it will be conserved and increased.

With the decadence of strife between nations, there come kinder relationships *within* nations; fellow-citizens quarrel less, and help each other more. When England was aggressive towards the external world, every man was armed, and disputes were settled by the sword. Duelling is now impracticable, even among military men. Judicial combats diminish; and law-courts are less disposed to wrangle than in past times. In all debatable matters, the rights of neighbours are being conceded; and individuality, instead of being treated as an abhorrent contumacy, is now regarded with deference and respect. In religion, in politics, in science, in business, people are permitted to think, judge, and act as they please. What a vast lessening of social friction does this effect! How enormously does it add to the economical progress of mankind! Co-operation, not combat, is becoming the rule of life. As we know from our daily experience, however, the world is yet far from a conceivable state of goodness. Wrong, oppression, greed, and chicanery abound; but not as aforetime. The proof is incontestable, for it lies in the general accumulation of wealth and the public morality which protects it.

One of the causes of the apparent decline in the returns of invested capital is that the habit of saving and investing is becoming general. Until recently, such poor people as could save, kept their money in a hoard. Ages of injustice, pillage, and political uncertainty had cruelly taught the weak and the humble that only by hiding their money could they keep it safely. At present, more than a hundred millions sterling belonging to the British working-classes are mingled with the prodigious national capital. Instead of lying in the shape of inert metal in holes and corners, it is fructifying on the owners' behalf and that of mankind generally. Security for their capital and the profits it bears, have given a huge impulse to the saving habits of the poor, besides widening their intelligence and sympathy. How powerfully the possession of securely-placed capital enlarges the mental horizon of men, is seen in the French peasantry. When the Revolution permitted them to buy land, their hoards were converted into fertile fields; dead capital was endowed with life.

Wealth grew so mightily that it could not be contained in France, and the peasants' economies had to overflow into foreign enterprises. Thus was the Suez Canal partially due to the sous and francs of French labourers. The Canal over the Isthmus of Panama is also being largely constructed with the capital of humble French people, and also by that of Spanish and Italian peasants, who likewise are sharing in the general enrichment and confidence of the age. Nay, so all-embracing is the passion for accumulation, that Irish farmers and labourers, notwithstanding the impoverishment and dismay now prevailing, find means to place money in the savings-banks. Even the negroes of the United States, who for the past two or three years have been hoarding all the gold they could save, are now beginning to place it in various commercial and agricultural enterprises.

Clearly, man is a thrifty being, if he has a fair chance; with the universally extending area of commerce and industry, the chance has come. No wonder, therefore, that the economisers of twenty and thirty years ago find that investments do not yield so prolifically as before. Competition brings down the price of all things. The extraordinary increase of investors, and the multiplication of capital by its accelerated overturn, are producing great changes in the financial position of all people. A new race of powerful capitalists have come into existence, and the progressive inclusion of all the productive parts of the earth adds hourly to their wealth. In thirty years, Australia and New Zealand have passed from almost worthless wildernesses into first-class contributaries of trade; so have the Western and Pacific states of America. British capital has made railways, docks, harbours, tramways, and telegraph communications all over the world. It has opened some of the richest mining districts of the earth; it has peopled deserts and converted savage wilds into fruitful regions. No less than sixty millions sterling is received as the interest each year upon British investments abroad.

Money, we know, makes money; and it is curious to observe that as accumulation goes on, its profits are less wasted. Rich men do not live in the lavish style of former days. Great nobles do not expend their revenues in stately magnificence, as their ancestors did. The love of pageantry, display, and luxurious show, is not now so universally prevalent. Royalty goes abroad unassumingly in a park phaeton; princely territorialists seek to enhance their fortunes by trade and manufactures, like ordinary men of business. A spendthrift aristocrat is despised by his own class, and condemned by humble folks; prodigality is under a ban. Having made wealth or inherited it, the possessor is constrained by the spirit of the age to take care of it—nay more, to increase it. Penny-banks and the Post-office invite the poor to save their odd coppers and put them into the mighty ocean of productive capital; even young children are taught to defer the joy that lies in a halfpenny, until they have laid up a store of many halfpennies.

The increase of work-people's capital is not the whole sum of their financial uprise. Economy rules the operations of their lives more and more. Health is better cared for; more comforts are

sought; pleasures recreate more and excite less; the training of children is improved; in a word, social energy is conserved. All this means diminished expenditure, and increase of wealth actually and potentially. The rising generation will not only inherit more capital, but will be disciplined to take care of it and to augment it as a prime duty.

But the cost of living will be greater than it is now. Here arises an apparent paradox. With greater wealth, greater funded capital, systematised economy, and all that goes to make life less of a struggle, yet the effort to exist is harder than it was for small capitalists and humble toilers, and promises to be harder still. The explanation is in the growing diameter of individual and national life. We are of greater intellectual and moral stature than our fathers; and our children will be taller than ourselves. The augmented tastes, desires, and employments, which make us so different from our rude sires, entail an expense that has to be met by all but the lowest amongst us. Increase of income, mental or monetary, is followed by a superior style of living. The artisan promoted to a foremanship, leaves a poor dwelling for a better; the foreman risen to a successful employer, goes into a higher social region. So in like manner, a nation like our own, under the persistent leverage of thrift, ascends *en masse* in the scale of being. Gurtl the swincherd lived in a condition but little removed from that of the beasts he herded. Gurtl's present descendant is housed more comfortably than Cedric was, and is much more lord of his person and fortune than was the Saxon thane. The rising tide of British and other capital has elevated Gurtl junior to the position he enjoys. He finds, however, that his accessions of dignity, right, and freedom have to be paid for. Hence the increased cost of the workman's household. While wasteful ostentation is disappearing among patricians, and millionaires are rebuked for thrusting their metallic superiority under our noses, the toilers of the fields, the forge, and the factory are compelled to live in a style never known to the sons of labour before. Dignity needs substance for its manifestation; thus the workman demands wages adequate to his exalted sphere. House-rents increase, food is dearer, education is a growing tax, amusements and holidays dip deeper into our pockets. Limited income frequently means unlimited anxiety in making both ends meet. The pressure of obdurate circumstances compels further economy, or further efforts to increase income, and whichever mode of relief is sought, the result is to augment capital.

Such appears to be the outcome of the commercial period now spreading over the world. Willingly or unwillingly, we are obliged to contribute to the funded resources of mankind. In warlike ages, men were forced to fight or be enslaved. Now, the conflict is for economical freedom. We see this going on everywhere. In civilised countries, mechanical devices have superseded human muscles in all the great industries. Railways have supplanted beasts of burden; steamships are abolishing sailing-ships. Cabs drove out sedan-chairs, and now tram-cars are supplementing cabs. Bicycles and tricycles are arrayed against saddle-horses and even coaches. Electricity has entered into competition with

steam, and may beat its rival out of the world, as steam overthrew its adversaries.

In the competition between barbarians and Europeans, the cheap production of wealth underlies all other contentions. Economy really decides who shall be masters of America, Africa, Australia, and India. Had the Red man, the Negro, and the Hindu been more skilful in turning the elementary wealth of their respective fatherlands to good account than Europeans, permanent conquest of those countries would have been impossible. Invasive races hold colonies and settlements on the tenure of superior economy; for economical law is fundamental, and governs the universe. The stupendous enrichment of the human family now going on is inevitable. Instead of decrying the accumulation of wealth, as some do, it is better to ponder the changed circumstances of the human family, which make capital so abundant and so safe. By so doing, much of the bitterness obtaining among men would pass away, and further facilities arise for bettering the condition of those who complain of getting so little of the vast wealth of the epoch. Although a few persons possess enormous capital, while the multitude has individually very little, yet the tendency is ever towards a more equitable division. Let us remember, that if poor people do not directly own much of the world's gear, they participate in the benefits of those great achievements of civilisation in which the capital of nations is sunk. The parks and promenades, the libraries and museums, the telegraphs, the railways, and other swift modes of communication, are all at their disposal. Workmen's trains and tram-services add to the profits of labour. Carried to the neighbourhood of his employment, the workman arrives with mental and physical vigour intact. This makes him of increased value as an industrial unit, and accounts partly for the higher wages paid than formerly. The workman's capital lies in his muscles and skill, and all the great advances of monetary capital generally make the workman's more valuable.

But the most striking of all the participations in the world's accumulated funds which is possessed by the sons of toil, is in the enlarged leisure of our time. Though we are not prepared to admit that there is no harm in much leisure, it is a significant fact that the hours of labour have diminished by nearly twenty-five per cent. in the past fifty years. This is one of the outstanding facts revealed by the growth of capital, and is of marked significance. Next to making efficient provision for their children or others dependent upon them, the object of those who strive to gain a competency is to enjoy a life of leisure; that is, to do what is most agreeable. Workmen now have two or three hours' daily leisure that their fathers were denied by the small capital of their time. Without some leisure, the higher and broader education of to-day would be almost useless, as would the many aids to social and personal improvement. The English workman enjoys more leisure than any other workman in the world, except the Australian; and this is owing to the magnitude of English capital, to its security and productiveness.

Considered in its general effect—and it is only possible to come to right conclusions by so doing

—the growth of the world's wealth implies the rising prosperity of all. Whether we possess much or little funded property, we share in the higher social development of our time. Measured by a fixed income, we may seem poorer, as millionaires increase and dividends diminish. Still, millionaires benefit mankind more than themselves. In their search for new millions, they lead to universal enrichment; in themselves attaining leisure, they win it for others. They are ranged on the side of peace and good-will among men; and however greedy of wealth personally, are allied with the practical moralists of the age. The ministers and servants of economy, they throw down the ramparts erected by barbarism against the intellectual and ethical progress of our species, and proclaim the fraternity of mankind. They drag the savage from his cave and make him share in the gains of civilisation; they lift the felon from his lair and bid him toil at honest work; they bid labour economise its capital, and place it in the general reservoir of wealth, thereby to share yet more largely in the triumphs of trade. Thus war, pestilence, and famine disappear, and peace, health, and plenty prevail. By the resistless progress of economy and industry, much that is repellent in Man and in Nature is eliminated, and that which is beneficent is multiplied.

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

BY DAVID CHRISTIE MURRAY.

CHAPTER XXI.—‘MY DEAR, I HAVE HAD A TALK WITH YOUR FATHER.’

‘AND so,’ said Garling, as he and Hiram walked together, ‘you have the whip-hand of me?’

‘That,’ said Hiram with great gravity, ‘is so.’

‘I am not accustomed to harness,’ observed Garling with his own grim smile, ‘and you will make little progress by driving me too hard. Before we go farther, I have something to say. Shall we talk here? We can have quiet.’ He pointed to a court upon the left hand; and without waiting for an answer, led the way, passing through a low-browed door with a sunken step, along a saw-dusted passage, and into a room the atmosphere of which was dense with stale tobacco-smoke. Seating himself at a battered and discoloured little circular table, he motioned Hiram to follow his example. By this time, Garling was as cool and self-possessed as ever, and his manner was simply business-like. ‘And now, Mr Search—that is your name, I believe—before you drive me farther, I must have a little talk with you.’

‘Well,’ returned Hiram, ‘there’s biblical precedent. Daresay you remember Balaam. Go ahead, sir.’

‘You are in good spirits,’ said Garling quite agreeably. ‘That is natural. But the best players are those whose spirits neither mount with gains nor fall at losses. Forgive me if I seem to lecture you; but since we are to hold a relationship so close as that of father and son, I can scarcely fail to feel a little proprietary right in you.’ The smile with which Garling accompanied these

words was such a compound of craft and mirth and malice as Hiram had never seen before. The younger man nodded with an answering smile, and for half a minute the two sat thus looking at each other, the cashier smiling—as Hiram said long afterwards in telling the story—‘like an octopus,’ and the other beaming back at him. ‘This is quite an agreeable meeting,’ said Garling, darkening suddenly. He went on abruptly: ‘You have an object to achieve, and so have I. It is in your power to put me to much inconvenience—inconvenience to which I would not voluntarily submit—I am quite candid, you observe—for a thousand pounds. But on the other hand it is in my power to inflict upon you, by submitting to that inconvenience, a disappointment which would, I presume, be considerable. You admit that?’

‘Yes,’ returned Hiram; ‘I admit that.’ A waiter with weak eyes, disorganised hair, and a dissipated-looking suit of evening clothes, here entered. The waiter’s garb had the look—common to dress-clothes worn in the daytime—of having been up all night; but the waiter himself had a contradictory appearance of having only just got out of bed.

‘Did you ring, gentlemen?’ inquired the waiter forlornly.

‘We did not,’ said Garling, resuming his smile. ‘I suppose we ought to have done so.—May I offer you any little refreshment, son-in-law? A little brandy? A glass of wine?—No?—I will take a little brandy, waiter, pale and cold.’

‘Bring me a cigar,’ said Hiram; and the waiter made his exit, like a troubled ghost who found it a relief to be laid.—‘I admit that,’ said Hiram again, nodding across the table, as a hint to Garling to go on.

‘Now, I am naturally a stubborn man, Mr Search,’ said the cashier resuming, ‘and I have a great dislike to being driven. You observe that I am candid with you? If I should find myself being driven too hard, I should probably kick over the traces. Now, that would be quite a melancholy thing for both of us. You would fulfil your threat; I should put my power into action; we should each be injured irreparably, and at daggers-drawn for the rest of our lives.’

‘It is a theme,’ said Hiram, ‘for one of the gentlemen who paint your coats of arms. Balaam right, quadruped left, and each with a drawn dagger.’ He said this musingly, eyeing Garling meanwhile with pleased contentment.

‘You are pleased to be facetious,’ said the cashier, looking at him from under beetling brows, but smiling still. So, in prize-ring matters, the Putney Chicken and Hammersmith Pet were wont to smile on each other, each with wicked patience waiting for his chance to plant a blow. The waiter came in at this juncture, ghost-like, and being again laid by the magic of a half-crown, fluttered off again, and once more made an appearance, and having, like the ghosts in legendary story, surrendered treasure, vanished finally. ‘You see, Mr Search,’ said Garling, sipping at his brandy-and-water, ‘that it will be unwise to drive too hard.’

‘I am not particular about the pace,’ said Hiram, biting off the end of his cigar, and looking complacently at his companion; ‘but I am bent on going all the way.—But come now, mister.

We can get along without being so lovely figurative, I reckon. Move on, and say straight out what you want.'

'I will admit you,' said Garling, 'to visit my daughter at any reasonable hours at which she cares to see you. If her mind is set upon it, I shall throw no obstacle in the way of your union.'

'That's very good of you,' said Hiram drily.

'Not at all,' returned Garling with superior dryness. 'So far, I am driven. At present, Mr Search, my daughter informs me—for I need no longer disguise from you the fact that I have talked with her upon this topic—that your occupation is that of a bus conductor. Permit me to indicate that I shall take a good deal of driving before I consent to allow my only child to marry a man who occupies such a position. Understand, sir, I am to some extent in your power. To a certain extent—understand me clearly—you can force me. Beyond that line, I will not go. You shall have free access to my daughter's society at reasonable times and in my presence. I shall place no impediment in the way of your ultimate union. But before that can come about, your social position must be much improved. If you accede to my terms, I shall not be unwilling to assist you in the effort to improve it. I do not think you can care to demand more than this at present; and I warn you that I will not yield a point beyond.' There he paused, sipped his brandy-and-water with a keen and secret glance at Hiram's face, and throwing one leg across the other, awaited a reply.

Hiram for his part pulled placidly at his cigar, and turned things over in his mind a little before he answered. 'Good,' he said at length—'good, in all respects bar one. We air so amiable and loving-tempered both of us, that you don't mind my being candid. Two is company—three ain't.'

'When you have tried my plan,' said Garling, 'your power will be no less than it is now. Be content with what you have. Let me have the satisfaction of knowing that I retire gracefully.'

'Cupid,' said Hiram, looking at him musingly, 'is really not a part that you'd look pretty in. No, sir; it is not a character to suit your style.'

Garling accepted this uncomplimentary statement without any change of countenance or sign of displeasure. 'Let me have a day or two in which to think that matter over, Mr Search.' That was all he said. There was no denying that he took defeat pluckily, and Hiram began to admire his courage and endurance.

'Mister,' he returned, 'I have trapped a good many critters of different sorts in various regions; but I never trapped a man afore. Most of the critters raved a good deal, and took it wild; some of 'em took it sulky. Now, you take it like a man, and I esteem you for it—I do. And I shall meet you fair, in consequence. *Pro tempore*, as we say in the Classics, the arrangement you suggest will fit the present-speaking Christian, easy. I've got my turn to serve; but I don't care about doin' more than serve it, and so I'll close with this remark—I shan't ride rusty so long as you go easy. But try to slip, try one dodge, and I am down, sir, like a fifty-ton steam Nasmyth hammer on an unprotected bull-frog! Now, you know.'

'Having arrived at that pleasant mutual understanding,' said the cashier calmly, 'we may part for the present, I presume.'

'Not yet,' returned Hiram. 'We'll go a piece up Fleet Street, if you please.'

The cashier assenting with a shrug of the shoulders, arose and left the room, and Hiram followed. In this order they traversed Ludgate Hill and Fleet Street, the cashier going foremost with bent head and hands folded behind him, looking unconscious of the figure in his rear; and Hiram with his head in the air, sucking smilingly at his cigar, coming on at an easy saunter, as though he had never seen Garling in his life before. Drawing near his own residence, the leader produced his keys, and having unlocked the door, admitted his companion. 'I forgot to mention one thing, Mr Search,' he said, as they stood together at the foot of the stairs. 'My daughter must necessarily know the arrangement we have come to; but she must not know why we have arrived at it. Any hint on your part that you have any control over me, will dissolve our bargain, and I will take the consequences. You understand me?'

'Yes.'

'And you agree?'

'Certainly.'

'You will respect all my private affairs so far as she is concerned?'

'I will,' said Hiram simply.

The cashier moved on again, and selecting a new key, unlocked the door at the head of the stairs. As he did so, a smile, against which he had fought his hardest for the last five minutes, broke out in his eyes and wreathed his features—a smile so cunning, so triumphant, and diabolical, that if his companion had seen it, he would surely have found a warning in it. He did not see it; but as Garling feigned to fumble at the lock, in order to make time to smooth his face, Hiram laid a hand upon his shoulder. 'Here's another part of the bargain,' he said severely—'I won't have her kept a prisoner.'

'There is no longer any need,' answered Garling, throwing open the door. His face was calm again, but there was still a light of triumph in his eyes which made him fear to show them. As he lifted his face momentarily on entering the room, his daughter saw upon it that new look, and for a moment wondered. But she had little time or inclination to question it; for there—wonder of wonders—at this cruel father's heels came Hiram, her hero, her lover, her man of men! Was the cruel father a good father, after all? She took one hurried step towards her lover, and her pale cheek flushed and her bosom heaved. Then she stood still, with her hands a little stretched towards him; and Hiram, coming boldly in, took her in his arms and kissed her, and laid her poor pale little face against his waistcoat, whilst she cried for joy. Beholding this, Garling walked to the window, as if he would not willingly be too much in the way. O Hiram, travelled citizen, 'cutest of omnibus conductors, cool and cunning and brave, you will have need of cunning and of swiftness to overreach the owner of the crafty eyes that look out on Fleet Street whilst you pet your innocent treasure and make much of her!

Be wary, Hiram! And you too, Garling, swift of mental fence, triumphing—be you wary, lest, in an hour you know not, the solid way before you shake, and yawn and engulf you. Crime-built castles are unsteadfast, Garling. Beware your ears, should the flawless walls come down at a run, as walls so built are like to do. No; Garling has no fears.

Mary, withdrawing herself shyly from Hiram's arms, looked from one to another of this curiously assorted pair, her father and her sweetheart, in a palpitating, happy, yet half-fearful wonder. Garling still looking out of the window, hiding his smile, Hiram answered her glances, and said: 'My dear, I have had a talk with your father. He is willing to allow me to wait on you, and he promises not to throw anything between us.'

'It is out of the question,' broke in Garling smoothly, speaking with his face turned to the window, 'that Mr Search should dream of marriage whilst occupying his present position. I shall find something for him to do, however, I daresay, and in that I may perhaps have to rely upon your assistance, Mary.' The smile flashed out again exultant as he said this; but by a great effort, he suppressed it, and turned upon them both his ordinary face of down-looking secrecy. 'In the meantime, it is enough to say that I withdraw my opposition to Mr Search, and that I leave you and him to settle matters between you. With this understanding—That nothing shall be hidden, but all clear, honourable, and above-board.' He looked a singular advocate for openness of conduct, as he stood there with his furtive hands behind him, and his secret eyes in ambush beneath his beetling brows; but Mary had no suspicion of him; and Hiram, though he thought he knew his man pretty fairly, held him in his power, and could always shake his knowledge over him. In a little while Garling drew out his watch, and remarking that he had business to attend to, arose, with a meaning look towards Hiram, who, not being anxious to disturb the seeming concord or to assert his power too soon, rose also, and after a tender farewell, departed with his host.

'You will write to me?' Mary whispered, following to the door.

'Yes, my darling—yes,' said Hiram, and was gone. The girl stayed behind happy, and Hiram walked away happy, at the new condition of affairs.

Garling went his way, triumphant. 'Had this happened six months ago, it might have cost some trouble,' he thought as he went along with his head bent and his hands clasped behind him. 'Had it happened a month back, it might have inclined me to hurry. But happening now, when everything is ready, it comes as a little welcome excitement, and keeps one from thinking too much of other matters.—And you have the whip-hand over me, have you, Mr Search? It was not worth while to give the fellow into custody; the affair might have got into the papers a day too soon. As it is, I have had my sport and gained my point into the bargain. Did you never trap a man before this, my astute American friend? Look at your trap next week.—I played him well,' he thought smilingly. 'It was high-comedy. I take some credit for the gravity of my yielding,

the solemn bargaining of the capitulation.—I declare, Garling,' he told himself in secret exultation, 'you have a sense of humour even yet. And that ignoramus thought to harness me! Tcha!' he snarled aloud, in vast contempt, and walked on, respected—many a City clerk looking reverently at the great manager, many a City magnate owing to himself: 'A clever fellow that. Close, but a jewel!'

'Mr Lumby is waiting in his room, sir,' said a clerk as the cashier passed through the offices.

'No, sir,' said another; 'he left five minutes ago.'

'Ah!' said Garling, throwing the words across his shoulder as he walked, 'I shall be here if he returns!'

Mr Lumby did not return; and the cashier sat among his papers, and did his work deftly, with wonderful rapidity and accuracy in combination. Practice, says the adage, makes perfect. That is partly true even of dull men; but given a genius for the thing practised, and it comes true literally. Four or five different sorts of men have I seen at work, and wondered. The keen sub-editor skimming with eagle flight his daily papers: mark him—scissors in hand he sits, and his eye has gripped a page ere you have read the title-line on the first column. Nothing there, and over goes the leaf. Ah, here! In goes the point of the scissors, out comes the destined scrap, and the page is turned again. And, in brief, before you or I had fairly handled half a page with certainty, he has run through a dozen daily journals, missing nothing, but has skimmed the cream from each and all. This is the result of practice and a curious and rare talent. Ask any sub-editor how rare it is. Or see an able physician approaching a case over which commonplace men have been puzzled, and watch him as he lays his finger on the cause of ill. Or see a great barrister with a brief in hand, a brief of which he knows nothing, but from which he must construct a case in one hour's time to carry before judge and jury. You would say he absorbs and mentally assimilates the contents of a folio by touch, rather than that he reads it. Yet swiftly as he goes, he masters it; and in court, one brief hour hence, you might think him familiar with the complicated case from infancy. Or once again, see a young artist struggling to draw some impossible bit of fore-shortening, and then see finished genius take the brushes. All these things are here named to typify Garling at his business. Came a tangle—his hand unravelled it. Anything wrong—his eye detected it. 'Here is the flaw.' The great piles of correspondence and sheets of figures to be examined melted before him. The piles examined grew and grew. It was a terrible pity that he was a scoundrel. It is related that a Greek father took his son to a merchant and proudly introduced him as 'the greatest liar in the Levant.' And the chronicler adds that the merchant accepted of the youth's service with tears of joy. But in the West we have got into a habit of regarding probity as a business essential. In all but honesty, Garling was a very pearl among business men. But what a 'but!'

The night came. He could count the nights now for which it would be essential to remain for the completion of his plans. They were

growing few, and in spite of the man's colossal composure, were growing terrible to endure. For it was not yet too late to restore all, and be honest, and yet well-to-do, and Conscience whispered sometimes that life would be sweeter so. It was no vulgar crime that he had planned, as it was no vulgar criminal who planned it. Here, for now nine years, had he worked patiently and gently, unloosening every here and there with subtlest fingers a tie which held complete control from him, and gradually drawing every string of the vast concern into his own hands. Then feeding his own resources slowly from those of the firm, and if needful, feeding the firm again from the fund thus fraudulently acquired, swelling his wicked gains year by year, and always fending off the crash to make his gains the larger; he had played his game so long that at last everything was his, and the great House of Lumby and Lumby was a bubble which would burst so soon as he shook it from his finger. There was nothing more to be got; the egg was sucked dry, the nut scraped clean out of the shell; and he waited merely for the transfer of his own legally acquired belongings to Spain, the swindler's refuge.

Now, as the time drew near, he adopted any precaution, no matter how ridiculous it seemed, that occurred to him; and on this night he took a little packet of cigar-ash from his purse, and strewed a tiny pinch on the top of every one of those gigantic ledgers in which his secret slept. His fears had grown so morbid that he had to arm himself anew, as it were, at every crevice of the armour he had worn so long. Even as he did this, he sneered at himself, and mocked the fears which prompted him. 'And yet,' he muttered, 'why should I be so infatuated as to miss any precaution I can think of. The books are not likely to be moved; but if they should be, I shall know it now.'

THE KYRLE SOCIETY.

SOME one has rightly defined the present century as an Age of Societies. The world is full of them. Not only are there national Societies, political Societies, secret Societies; Societies religious, scientific, and archæological; in addition to these, the chronicles of the nineteenth century will reveal to the historian of the future a multitude of lesser Societies which honeycomb the entire fabric of domestic life in our times. It seems as though we were all taking to heart at last the old fable of the bundle of sticks; and so, whether people wish to be charitable or temperate, or learned or philanthropic, they make the effort gregariously, conscious of the value of 'a long pull, and a strong pull, and a pull all together.'

Among the many Brobdingnagian associations of the world at large, and the countless Lilliputian ones set on foot in private circles, a Society of recent date is beginning to lift its modest head and claim our special attention. We refer to the Kyrle Society.

There was once a kindly philanthropist named John Kyrle, who some two centuries ago spent his slender estate in benefiting and beautifying his native town of Whitehouse, in Gloucestershire, and has thus earned for himself the title of 'the

Howard of his age.' Very little else is known of him, except that he died at a ripe old age at Ross, in Herefordshire, where his estate lay, and where he also busied himself in making his surroundings beautiful. The world is apt to forget its benefactors; and but that Pope has immortalised John Kyrle as the 'Man of Ross,' the very name of this insignificant philanthropist might have passed into oblivion. He certainly could never have foreseen that it would be revived after a lapse of nearly two hundred years, and chosen to designate a Society enrolling men of note among the members banded together to follow in his footsteps.

The aim of the Kyrle Society is ambitious, being, as we shall see, no less than 'bringing beauty home to the people;' but its simple motto promises only, 'To the utmost of our power.' The multitude may at the first glance pronounce its object Quixotic. Indeed, *Punch*, that good-natured censor of the age, has already talked about 'bringing beauty home to the pantry,' and caricatured for us a member of the Kyrle Society distributing peacocks' feathers, ox-eyed daisies, and tiger-lilies at a Domestic Economy Congress! But ridicule notwithstanding, no one familiarly acquainted with London and other great cities can doubt that the work of the Kyrle Society is needed. To think that human beings, fellow-countrymen fashioned in the same mould as ourselves, should be born and reared in the midst of ugliness and squalor, just supporting life indeed like the beasts that perish, but with never a sight nor a thought of those things which make life worth living!

There is a great talk in these days of beauty and high-art and all the rest of it, a great ministering to the fastidious tastes of the upper classes. Shall not those who daily revel in the enjoyment of sights and sounds of beauty, have some compassion for the eyes which never rest upon tree or flower nor any of the lovely things of this beautiful world, but only upon gray dinginess and squalid misery? Shall we not take some thought for the tired ears upon which no soothing melody of voice or instrument ever falls, only a discord of street cries and harsh quarrels? Shall we not feel some sympathy for the souls that are never stirred to nobler thoughts by contact with any loveliness of art or nature, with nothing around them in the hours of toil, or in the hours of leisure, to create an image of beauty even in their dreams?

'Beauty is God's handiwork,' once wrote Charles Kingsley. 'Welcome it in every fair face, every fair sky, every fair flower, and thank for it Him the fountain of all loveliness, and drink it in simply and earnestly with all your eyes—it is a charmed draught, a cup of blessing.' How, then, would Kingsley have welcomed the institution of this Kyrle Society, which takes for its avowed object the bringing beauty home to the people—the people living in the outer darkness of squalor and unloveliness, whom he yearned to refresh with the 'charmed draught' so sweet to himself!

There are four especial ways in which the Society tries to disperse more widely the refining influences of natural and artistic beauty. (1) It proposes to decorate workmen's clubs, hospital wards, workhouses, &c., with gifts of flowers, mural paintings, pictures, and other artistic

objects likely to please the eyes of their occupants. It carries out this programme without bigotry; for the decorations are made in public meeting-rooms used for either social or religious gatherings, without distinction of creed, in a wise spirit of tolerance worthy of the times. (2) It desires to encourage in poorer houses the window-gardening which in London at all events seems to be a luxury reserved for the rich, and to turn to account for cultivation as gardens all strips of waste ground, and even areas and backyards. (3) It undertakes also the difficult task of providing concerts of good and attractive music in the poorest parts of London by the help of voluntary choirs, using for the purpose any churches, halls, or schoolrooms that may be available. Musical treats of this kind have already been given in some of the metropolitan hospitals and workhouses. (4) Last, but not least, the grandest efforts of the Society are given to preserving open spaces both in town and country to be laid out as public gardens. It co-operates in this branch of its work with both the National Health and Commons Preservation Societies: for all alike feel the importance of securing breathing-space for the lungs choked by the smoke and dust of the working world of London and other great cities. It is hoped that in time some of the long-disused churchyards of the Metropolis may be devoted to the same purpose; for how could the abode of the dead—well-named God's-acre—be turned to better account than for the benefit of the living?

Already in the four or five short years of its existence, the Society has worked zealously in each of these departments, not in London alone, but in Nottingham, Liverpool, and Westbury also; while infant Societies of the same kind have been started at Birmingham, Birkenhead, and Leicester. A Society with similar aims, known as the Cockburn Society, has long existed in the Scottish capital.

The Kyrle Society was instrumental in saving for the public the green time-hallowed shades of Burnham Beeches; and it is continually taking energetic steps to abate the smoke arising from private and factory fires, which is such an active agent in defacing our public buildings. London streets will never be paved with gold, as our childish fancies led us to expect; but the successors of John Kyrle in the task of benefiting humanity may win back for it some of its ancient charms, when soot and smoke are abolished, and the atmosphere is partially purified.

Royalty countenances the efforts of these nineteenth-century philanthropists. The Duke of Albany—who, more than any other of the Queen's sons, seems to have inherited his father's tastes—is the President of the Kyrle Society; the Princess Louise is Vice-President; and many another noble name distinguished in the world of art or in the world of philanthropy swells the list of those who give it their support.

The Society is in need of funds; but it needs something else quite as much—the active help and sympathy which even the humblest can afford to give. The horizon of usefulness before it widens day by day; its aid flows out in ever-diverging channels. We should mention that any one sympathising with the objects of the

Society, and desirous to promote its work, may become enrolled upon the list of members upon applying to the Honorary Secretary, whose address is 14 Nottingham Place, London, N.W.

Poverty, as we must all own, need not of necessity be squalid. Cross the Channel, and take a look at the continental towns and cities. There the life of the lower classes has its picturesque side; the result, or possibly the cause of a natural taste for the beautiful being developed even in the poorest peasant. The fisher-girls upon the opposite coast deck their persons as well as their houses, and go about their daily tasks unconscious models for the artist. The blue-bloused peasant working in the fields must supply his bit of colour to complete the landscape; and the *bourgeois* condemned to town-life, would not suffer about him the sad-coloured houses and sober surroundings which we allow under our gray skies. What a host of stored-up pictures crowd into the mind, as memory fills in the pleasant background of a poor man's life abroad! Even the lazy *lazzaroni* who lounge through life under Italian skies, ask their alms upon palace-steps, amid the plash of fountains and the scent of orange-groves! But what a revolting contrast presents itself when we think of a poor man's life at home in Seven Dials or similar slums, the Augean stables of civilisation, whose cleansing and beautifying must needs prove a Herculean task!

And sight is not the only sense gratified upon the other side of the Channel. The ear is pleased as well as the eye. Open-air concerts are put within reach of the people at a mere nominal cost, or at no cost at all. The German imbibes with his beer a refreshing draught of music, which elevates him above the mere sensual enjoyment of the moment. The mountaineer *jodels* his way cheerily from Alp to Alp, and peasant-voices everywhere lend themselves almost unconsciously to a 'concord of sweet sounds,' which makes the wheel of life revolve smoothly and harmoniously.

Surely we islanders may in many respects take a hint from our neighbours on the continent, and remember that we are not doing our duty by our fellow-creatures if we only give them the opportunity of earning material sustenance by their toilsome labour.

'Tis not the whole of life to live!

Let us give them the wherewithal to build themselves 'nests of pleasant thoughts,' as Ruskin puts it. Let us, to the utmost of our power, foster the higher life of the spirit, and refresh the 'dulled ears and aching eyes of our working-classes for their never-ending struggles with the briers and thorns of 'this workaday world,' by a communion, whenever it is possible, with whatsoever things are pure and lovely and of good report.

OUR FRENCH PROFESSOR.

CHAPTER I.

WHEN I was a youngster, working my way up the academical ladder, I was engaged as mathematical master in the school—called Wimbourne Hall—of a certain Dr Walters. It was in a remote part of the country, and I should perhaps have found the place dull, but for the company of a niece of the Doctor's—the sweetest girl, I

fervently believed, within the British Islands. She acted as the mistress of the household; that is, she presided at the tea-table, received visitors, and did what she could to fill up an important hiatus in the establishment. Mrs Elphinstone, a matron of extensive charms, was the housekeeper, and looked after the nurture and housing of the boys.

Dr Walters was an old bachelor, one of those bookish men who never think of marrying. He was always making dictionaries, writing archaeological monographs, criticising German philology and theology for the quarterlies, and otherwise so absorbed in learned pursuits, that he was practically lost to us from five in the afternoon till eight next morning out of each twenty-four hours, except for prayers.

The school was limited to a dozen boys, and they were the sons of wealthy people; for the Doctor's terms were high. A young Oxford man shared with me the management and instruction of the pupils. He was the English master. Dr Walters taught the classics and modern languages. I, as before said, was mathematical master. The work was easy; the salary good. I had ample time for my own studies. Dr Walters was a kind, though pompous man, with an overweening belief in his own abilities, and an intense admiration for the aristocratic classes. Rank and titles had quite a fascination for him. He had been tutor in several noble families, and his pupils were all scions of county magnates. The tone of the establishment was very high, and would have been almost oppressive for me but for the gentle influence of Miss Emily White, the Doctor's niece.

She was about eighteen, full of young enthusiasms, and utterly ignorant of the world outside her uncle's house. Three years before, she had lost both parents, and thenceforward had been installed as girl-mistress of Wimbourne Hall. Dr Walters loved her as much as a parent could have done; but his absorbed mode of life made him quite unable to perceive that a girl wanted more effective guardianship than was afforded by an elegant and irreproachable home. He seemed to think that under his roof everything must go on with celestial propriety. That a disaster of the heart could befall Emily, from the society of young and susceptible under-masters, was as little present in the Doctor's consciousness, as the thought that he had a superior in the critic's art. It is astonishing how blind and incapable many learned men are in matters which the simplest peasant sees and understands in all their complexities.

I had fallen over head and ears, as the saying is, with Emily. Such was inevitable. In addition to seeing her at meal-times, I spent two hours with her every evening, save Sundays. School-work was over at seven o'clock; and from that till nine, I gave Emily lessons in music; perhaps it would be more exact to say that we practised together. I was devoted to my violin, and had made it a condition with Dr Walters that I should be allowed to keep up my practice. But my bedroom was near his study, and fiddling does not mix with sober criticism of abstruse German theology. I fear my wild improvisations gave an unusually acute point to the Doctor's incisive onslaughts, and that I am responsible

for much wrath in learned breasts. However, my worthy employer found it expedient to allot the drawing-room to me for practising, and soon after requested me to give Miss White the advantage of my superior knowledge.

Well, much time was spent in dueting. Emily played the piano with fair skill. Mr Loftus, the English master, did not care for stringed instruments; in fact, he rather disliked music of any kind. He was reading hard, as he intended to become a clergyman. The object of his life was to take a high place upon the Episcopal bench; so Loftus either hid himself in a corner of the drawing-room, to get as far as possible from the strains of Mozart, Haydn, and Beethoven, or he took his heavy books upon church history into his own room. One or two of the elder pupils would occasionally come in to hear the music, but often we were left alone.

Since the time of Orpheus, to go no farther back, music has had much to answer for in entangling the destinies of men and women. There is something in wordless phrases and cadences that unlocks the depths of the heart; and fiddles are so full of passion, that if one has not an actual object to which their adoration may be directed, an imaginary Dulcinea must be conjured up to satisfy the fantasy. But I never gave any verbal utterance to the strange joy that Emily's presence inspired. My violin pleaded my cause with a vehemence that would have electrified my old master, Signor Golfi. All the whirlwind delirium of my soul escaped through bow and fingers, and I was often amazed at my own astounding powers.

Emily was sometimes disconcerted by the energy of my playing, and had much ado to keep up the accompaniment. She was as fond of Mozart as I, and took fire at the effulgence of his radiant music as readily as myself. Yet, though we both approached the brink of Love's abyss, we said nothing of our perilous position. Perhaps our eyes were moister than they need have been when, after successfully finishing an ecstatic *scherzo*, we looked at each other for a moment. We got into the habit of pressing hands rather fervidly after practising also—at least I did; and I fancied that Emily returned my warm grasp more firmly than was usual for a shy and timorous girl. Still, we were as uncommitted to a declaration as if we were respectively allotted to other partners for life.

Oh, charming time! when heaven and earth were commingled; when affection and despair were so strangely blended in mystic unity, that life was more romantic than poet's wildest frenzy could express.

And now menacing shadows began to gather over my paradise. A satyr stole into the garden; a sinister, alarming object for me. One morning at breakfast Dr Walters told us that he had engaged a new master, who was to teach French and German, and to assist him in a theological work of reference he was about to edit. I did not feel much interested in the matter, and it had passed from my mind. But at dinner it was made vivid enough; for I found a French gentleman sitting at table when I entered the room.

I was duly presented to M. De Montgris, who

was a man of thirty, medium in height, but squarely built. His hair was coal-black, and so was his beard, which rolled in ebon waves upon his cheeks, giving him an impressive appearance. But his rapid eyes, that were insolent and furtive, in the same glance, marred the first impression, and made one wonder what sort of character he had. His nose was aquiline; and his teeth gleamed in their faultless array like those of a savage. He spoke English exceedingly well, and with a polished accent. His manners were elegant; yet it seemed to me that a brusque vulgarity now and then displayed itself when he grew animated in conversation. I judged him to be a cynical man of the world, for his eyebrows seemed to me to twitch disdainfully at many things that were uttered at the table. He paid scrupulous attention to Miss White, and confused her with elaborate politeness. He scarcely noticed anybody but her and Dr Walters.

As for me, I disliked him from the first moment, and by the end of the meal I detested him. He appeared to share in the aversion, and looked at me when I spoke with the most cunningly veiled contempt. He had a way of smiling that made his shining teeth convey the most irritating insults. Naturally, French literature became a topic of conversation, and I ventured to give an opinion upon Massillon's style, saying that I preferred it to the more gorgeous periods of Bossuet.

'You know French, sir?' demanded M. De Montgris with an incredulous smile that cut me like a knife.

'I have read some of the best authors in the language,' I replied coldly.

'And you are quite sure that you understand them?' he returned with an air of mock solicitude that maddened me.

'Perhaps as well as you do, Monsieur,' I said with some warmth.

His eyes flashed upon me their full insolence, his teeth derided me, and the curve of his brow proclaimed me an ass.

'The young gentleman is no doubt very clever,' he continued with a pitying smile, directed to Miss White and the Doctor. 'Is he in the upper class?'

Emily looked at me pained and puzzled. The Doctor said mildly: 'You are under a mistake, Monsieur. Mr Bevan is not a pupil; he is our Mathematical Master, and a Bachelor of Arts. I thought I had introduced you.'

'Ah! pardon, pardon!' cried the Frenchman with unctuous penitence in his voice, while his eyes and teeth said still more incisively than before that I was a wretched nincompoop. 'The young gentleman,' he went on, 'has such an ingenuous, adolescent, undeveloped appearance, that I thought he was one of the elder pupils.—You will forgive me, Mr Bevan, I hope. I am sure we shall spend some delightful hours together after duty is over, and become real *bons camarades*.' I cannot describe the perfectly adjusted insolence of look and gesture that made this speech the antithesis of what it professed to be.

When De Montgris had finished, I looked at him to such purpose that his eyes sank furtively towards his plate. I felt that we understood each other from that moment.

The sting of his criticism upon my personal

appearance was the more acute because I knew that I had a juvenile exterior. Though I was twenty-three, scarcely the trace of a beard was upon my face, and my light complexion was as soft and delicate as a girl's. No detraction is so hard to bear as that which is partly based upon truth. We can pass with disdain the malevolence that is directed at our assured powers; but few can support with equanimity the sarcasms that wound a foible.

When dinner was over, De Montgris hastened to open the door for Emily, and bowed to her with a stately courtesy that only a chamberlain or a wonderfully receptive valet could imitate. She blushed scarlet, and hurried away. Then the Frenchman sauntered with the most elegant complacency to the Doctor's chair, and begged permission to be shown to his room, and to have the assistance of a servant to arrange his wardrobe. His nonchalant demeanour and almost condescending patronage of our grave and pompous principal, surprised the pupils. So far from resenting it, the Doctor treated his underling with a deference that filled me with amazement.

In a few weeks De Montgris had deposed all authorities, and ruled Wimbourne Hall as though he were its master. Not openly, however. He supplanted Dr Walters by a mixed behaviour of flattery, condescension, and insistency. He fascinated Emily as by some supernatural ascendancy. She seemed a mere passive instrument in his hands. Loftus was quite under his control, and did whatever he was bid. Mrs Elphinstone was never tired of rehearsing his praises, and declared him to be the most perfect gentleman she had ever known. But his greatest admirers were the boys. De Montgris was the most amusing companion in the world, master of a hundred clever tricks of skill and force. He was a conjurer, gymnast, and fencer. He told the drollest stories, and his foreign accent gave them a piquancy that provoked roars of laughter. Then he had travelled widely in Europe and Africa; had fought against the Arabs; had been a lion-hunter, and was the hero of such exploits as rouse the whole enthusiasm of a boy's nature.

But that which produced the greatest bias in his favour was a report of his high connections. The rumour ran that he was a Marquis, who had been compelled to leave France from family and political causes, and that his stay in England might be short. He was playing a romantic rôle rather than earning a livelihood as a Professor, and looked upon it as a joke; still he attended to his duties steadily enough, and worked hard at the Doctor's theological encyclopædia. Notwithstanding my dislike, I was compelled to admit that he was a good teacher, and friendly to every one but myself.

It is said that the English have a peculiar veneration for high rank, and our pupils being of the upper class, naturally were delighted with a Marquis of the old *noblesse*. They made him their model, and the struggle was to imitate as far as possible the brilliant exile. He could ride horses barebacked and even without a bridle. He vaulted and tossed a somersault like an acrobat. He was a dead-shot. He swam and dived like an aquatic creature. He was equal to a professional wizard at prestidigitation, and

could do what he pleased with cards. This cleverness was quite unknown to our principal, who detested cards with a singular aversion. In the house or out of it, De Montgris kept the boys lively to the top of their bent, and the life at Wimbourne Hall was marvellously gay for all but me.

STUDENT-LIFE AT GÖTTINGEN.

THE old and far-famed University town of Göttingen lies in the fertile valley of the Leine, about three hours' drive by train from Hanover. Its situation can hardly be called picturesque, as it stands in a comparatively level district, with no very important hills in the immediate neighbourhood. Yet, when seen from the terrace of the Rhons Hotel, which is built on an easy eminence to the east of the town, or still better, when viewed through the rose-coloured spectacles of after-recollections, Göttingen is by no means devoid of natural beauty.

Everybody, we suppose, is tolerably familiar with the general aspects of German student-life, which is to a large degree similar in every university of the Vaterland and Austria. The system is so far like the Scotch in that the students live in lodgings, not in colleges; but their lodgings are recommended by the University authorities, and a register is kept for the use of students. Besides the regular Professors, ordinary and extraordinary, there are teachers known as *Privatdozenten*, whose lectures qualify for the examinations, and who sometimes have larger classes than the regular Professor. This system is now partially introduced in the faculty of medicine in connection with some Scotch universities.

Göttingen students may be conveniently divided into Workers and Corps-students. The former are lean and serious-looking individuals, of meditative aspect, not easily accessible, and to be chiefly approached at meetings of the Philosophical or Natural Science Societies. The latter are stout and gorgeous exquisites, with caps of divers hues, to be found at all hours of the day (and night) promenading the Weender Strasse, and every Saturday morning driving out to the *Landwehr*, to what might well be called the 'happy hunting-ground' of the Göttingen student, and of which we shall have by-and-by to speak.

The student proper, however, claims our first attention, and we cannot do better than try to give some idea of an ordinary working student's day. The typical student is an early riser—a contrast here to his English brother—and six o'clock will generally find him at work, when his *Morgencaffee* is brought to him—plain bread and coffee. This he takes by the open window, as he looks over his Professor's yesterday's lecture; and seven o'clock will probably find him *en route* for the Auditorium, a fine building, that stands near the Botanical Garden, and is used by the Philosophical and Theological Faculties. The college bell rings at a quarter past seven; for the academic quarter is a recognised institution here, and punctual to a moment the Professor opens the door and walks rapidly up to his desk. One glance round, as he pulls from his pocket a bulky manuscript, and then he begins, resuming his

lecture at the point where it had been interrupted on the previous day. For three-quarters of an hour this goes on; not a sound in the room save the too often monotonous drone of the Professor's voice, and the scraping of a multitude of quills. But no sooner has the first stroke of the clock announced the close of the hour, than the Professor bundles up his lecture, and slips away almost before his hearers have written down his closing words. Indeed, we have sometimes seen a Professor deliver the last sentence in his progress between the chair and the door. The students themselves are more leisurely, and bundle up their papers in a leather case or *Heft*, and then pass out into the corridors, where they wait till the short interval between one lecture and another has expired.

If the student has no more lectures to attend just then, and if the dreaded Examination is looming ominously near, he will probably go home and spend the forenoon over his books. A light lunch or 'breakfast' about ten does not interfere with his excellent appetite for dinner, which is invariably taken between one and two. Students in lodgings always dine at some restaurant, with the proprietor of which they have a contract by the month. This is a very sensible method, and brings him into easy and pleasant social intercourse with his fellow-students. You enter the hostelry about one o'clock, and find the long tables surrounded by a merry crowd of students, who greet you as you take your seat with the more familiar than devout '*Mahlzeit!*' The waiter lays before you the bill of fare; and having ordered your dinner of three courses, which, with a tankard of beer, will not cost much above a shilling, you exchange pleasant greetings with your personal friends. Round the table, an animated conversation is going on about the events of the day, the thousand-and-one incidents of University life, the peculiarities of Herr Professor L—, or the latest prophecy of Dr K!— After dinner, the inevitable cigar is smoked; some play cards, some billiards; while over most there creeps for an hour or so a feeling of pleasant drowsiness till it is time to go to afternoon lecture. College-work is over by five; and after that is the time for a walk or other outdoor exercise. *Abendessen*, or supper, follows at seven, also in a restaurant; after which, as a rule, students go home to their books.

One or two nights a week are, however, set apart for the meetings of the various Societies or *Vereins*, and these are well patronised by all save the most desperate 'grinders.' Suppose we look in at the Natural Science Club, which meets every Tuesday evening at eight in a large room connected with a charming pleasure-garden. We are ushered in; and having been introduced to the President, bowed to the Society, and inscribed our names duly in the Society's visitors' Album, we take our seat at a table round which the members are gathered. A waiter noiselessly brings us a glass of beer from a cask that stands unblushingly in the corner, and which speaks volumes for the beer-consuming powers of the Natural Scientists. One of the members is giving a sketch of some recent scientific discovery, illustrating the principle as he goes along by diagrams on a blackboard, which elicit

from his brother-members a considerable amount of good-natured chaffing. When his paper is finished, the President calls for remarks; and a discussion takes place, serious and sensible, on the subject of the essay. The President closes the sederunt by summing up the results of the discussion.

Now, in England or Scotland, students would thereafter go quietly away to their own studies; but not so the German. In fact, to judge by the satisfied looks of the members, and the gusto with which they get their glasses replenished from the not yet nearly exhausted cask, one would feel justified in supposing that the best part of the evening was yet to come. When all are provided with beer, the President calls 'Silentium!' and announces a chorus from the *Commers Buch* or Collection of Student Songs, a copy of which each member has on the table before him. Then the whole Society bursts into song, the festive *Gaudeamus*, the epicurean *Freituch des Lebens*, or the exquisite *Lorelei*. This ended, every one jumps to his feet, and clinking beer-glasses together, the students drink their neighbour's health, and indeed the health of everybody within arm's-length. An interval for conversation is then made good use of, till the President's 'Silentium!' is again heard, and a recitation or story is announced. Shouts of applause follow; and Herr Langbein's health is cordially honoured by the Society standing. And so for an hour or two the Society proceeds, one by one of the members dropping out and away with clear heads to their solitary vigils. Each one as he goes pays for the beer he has consumed, at the by no means exorbitant figure of a penny a glass.

Very different from the life we have been describing is that of the Corps-students. It must be confessed that they are students in nothing but in name, whose main object in the University is to enjoy life, and to support on all occasions the honour and dignity of their Corps.

There are four or five different Corps in Göttingen, going by different names, and distinguished by caps of different colours. On state occasions, such as *Commers* nights, they appear in gorgeous dresses, with handsome swords by their sides, and suggesting to the mind pictures of mediæval knights.

There is much that is pleasant and attractive about a Corps student, and the fundamental idea of the Corps, which is Brotherhood, is certainly unimpeachable. Yet the actual state of matters is far from the ideal, and there is much that must appear absurd and incongruous to an outsider. For example, they are scrupulously polite and courteous among themselves, and indeed to outsiders, provided they are not members of another Corps. But inasmuch as the prosperity and prestige of a Corps depend entirely on the number of duels fought and won by its members, it is necessary to find some excuse for an encounter with some member of a hostile Corps. Hence many little insults pass between different Corps, and these are readily magnified into an occasion for a meeting at the *Landwehr* the following Saturday. It is not easy to see a duel, unless one be a member of a Corps, for 'Philistines' and ordinary students are strictly prohi-

bited. But foreigners are courteously welcomed; and so, one Saturday morning, we found ourselves, with another English friend, driving out to the *Landwehr* to witness a duel.

The *Landwehr* is a wayside inn about two miles from Göttingen, a peaceful-looking little place during the week, but on Saturday mornings the battlefield of the different Corps. In the garden of the inn there is a building set apart for the students, consisting of an open area, round which runs a low gallery. After some formalities, we were led to the hall, and took our seats in the gallery, where the students not actively engaged were busy consuming the potent Bavarian beer, or the choice red wine of mine host of the *Landwehr*.

Down below, a different sight met our eyes. When we entered, one duel was just over; and the combatants were lying on two sofas, surrounded by their seconds and comrades, and getting their heads swathed in linen, and bits of sticking-plaster dotted over their faces. The floor was besprinkled with blood; but a little sawdust soon restored it to its pristine purity, externally at least. The Corps doctor having examined the wounds, and pronounced them not deadly, was moving calmly up and down, eating a sandwich. In another corner of the room, two members were being got ready for the second duel; and we watched with considerable interest their movements. The laws of German duelling are very precise, and it must be admitted that every precaution is taken to prevent a fatal termination. For instance, a thick padded cravat is tied round the neck, to protect the jugular; the breast and right arm are still more carefully covered; the eyes are shielded by strong steel-wire goggles; so that the only parts exposed are the scalp, the nose, the cheeks, and the ears. Then the sword or *Schlüger* of the duellist is not a heavy weapon that would smash the unfortunate combatant's skull at one blow, but a thin light blade, without a point, and whose only dangerous quality is its razor-like sharpness. Still, the game is not mere play, as might be seen when the two duellists faced each other in the arena, with pale and firm-set lips. Not that there was any failure of courage either; for no sooner had the seconds given the signal, than the swords went slashing right and left, with such lightning rapidity that it was difficult for outsiders to follow them. Suddenly the seconds cry 'Halt!' and the swords are struck up. The reason may be a slight scratch that one of the fighters has got, which is forthwith recorded in a book kept for the purpose, and the duellists immediately resume. The fight is too sharp, however, to last very long; and the combatants, from the violence of the exercise alone, even though no wound should be given, are soon exhausted. Sometimes very ugly cuts are received; and cases are by no means rare of noses and ears being cut off in the fray. The duel over, the insult is supposed to be avenged; and the combatants retire for a time into private life, appearing soon in the Weender Strasse with elegantly plastered cheeks, and black patches scattered promiscuously over their heads.

Duelling and beer-drinking, the latter as amazingly developed as the former, are the two chief employments of the Göttingen Corps student. His

leisure hours are devoted to study; but so hard a life has few, very few leisure moments! Pleasant excursions are often made to some of the beautiful surroundings of Göttingen, for example, Plessy, Gleichen, Hardenberg, &c. At Nörten, a village about six miles off, the students frequently have what is known as a *Commerz*—that is, an evening devoted to beer-drinking and singing, which generally ends in a very different fashion from the social meetings of the *Verein* already described.

We know of no more delightful place to spend a summer season than Göttingen. There are many pleasant gardens in the town, where one can listen every evening to excellent music by a military band, and improve his German among the kindly citizens, who are always courteous and friendly to a foreigner, provided he is not *too* insular and unpleasantly British. He will not feel a stranger in a strange land; for if he likes, he may join the Lawn-tennis Club of his countrymen, or the Base-ball Association of the American colony. The place is haunted with the memories of great scholars; but probably a small house on the ramparts, now converted into a dye establishment, will attract the attention of the foreign student. Here it was that Prince Bismarck lived during his stormy student days, the most immoderate of beer-drinkers and duellists of his time. Heine too, the poet, whose lyrics are among the gems of German literature, was a student here; but after innumerable scrapes with his Professor, he had to take a hurried leave one morning of his Alma Mater, to escape imprisonment. His revenge was taken in after-years by the numerous sarcastic references to Göttingen and its Professors in his poems and prose writings.

THE ROYAL BRICKLAYER.

AN OLD LEGEND OF EASTWELL.

ROUND the picturesque precincts of Eastwell Park, now the summer seat of H.R.H. the Duke of Edinburgh, and situated in the centre of one of the loveliest landscapes in the fair county of Kent, there lingers a time-worn tradition of an obscure bricklayer in whose veins is said to have coursed the best blood of Britain. Living the life of a recluse, and supporting himself by the humble occupation just indicated, he yet—so runs the story—claimed sonship to the last of the line of Plantagenet monarchs, he whose fate was sealed at the battle of Bosworth Field. The legend has obtained extensive credence; and tradition has it that a raised tomb—with indents for monumental brasses, but bearing no trace of memorial inscription—standing half within the wall of Eastwell church, marks the spot where the Royal Bricklayer slumbers in the sleep which knows no earthly waking. About the beginning of the eighteenth century, there might, it is said, have been seen in the Park a relic of the single-roomed dwelling built and tenanted by this mysterious man, and also part of a ruined wall, both bearing his name. But the evidence which

gives the greatest colour of truth to the tradition is an entry in the parish register for 1550, which runs as under:

'RYCHARD PLANTAGENET was buryed the 22d. daye of December anno et supra.'

It is worthy of note that this entry has a peculiar mark prefixed to it, which mark is attached in the Eastwell registers to noble names only. This circumstance certainly points to the supposition that the person who registered the burial, more than three centuries ago, was persuaded of the dead man's aristocratic origin. Little of a conclusive character beyond the faded record in the old register of Eastwell can be adduced in support of the tradition; hence a haze of doubt hangs round the whole story. The tradition itself has, however, been preserved; and we give it here for what it is worth, with a few elucidatory remarks.

The narrative in which this tradition is embodied was obtained in the year 1720, by Dr Thomas Brett, from the lips of Lord Heneage, Earl of Winchelsea, then owner of Eastwell; and was communicated by the doctor in a letter to his friend William Warren, President of Trinity Hall, Cambridge. This letter was shortly afterwards published by Peck the antiquary in his *Desiderata Curiosa*, to which work we are indebted for an account of the tradition as recounted by the Earl of Winchelsea.

'When Sir Thomas Moyle (Chancellor of the Court of Augmentations in the latter end of the reign of King Henry VIII.) built that house (Eastwell Park), he observed his chief bricklayer, whenever he left off work, retired with a book. Sir Thomas had curiosity to know what book the man read, but was some time before he could discover it, he still putting it up if any one came toward him. However, at last Sir Thomas surprised him and snatched the book from him. Looking into it, he found it was printed in Latin. Hereupon, Lord Winchelsea examined the man; and finding he pretty well understood the language, inquired how he came by his learning; whereupon the bricklayer informed his employer that, as he had been a good master to him, he would venture to trust him with a secret he had never before revealed to any one. He then proceeded to state that he was boarded with a teacher of Latin, without knowing who his parents were, until he was fifteen or sixteen years of age. A gentleman—who occasionally would remark that he was no relative—came once a quarter and paid for his maintenance, and took care to see that he wanted nothing. One day this gentleman took him on a journey and conveyed him to a fine, great house, where he passed through several stately rooms, in one of which he left him, bidding him stay there. Then a gentleman grandly dressed, with a star and garter, came to him, asked him some questions, talked kindly to him, and gave him some money. Then the fore-mentioned gentle-

man returned, and conducted him back to his school.

'Some time after, the same gentleman came to him again with a horse and proper accoutrements, and told him he must take a journey with him into the country. They went into Leicestershire, and came to Bosworth Field; and he was carried to King Richard's tent. The monarch embraced him, and told him he was his son. "But, child," says he, "to-morrow I must fight for my crown. And assure yourself, if I lose that, I lose my life too; but I hope to preserve both. Do you stand in such a place"—directing him to a particular spot—"where, out of danger, you may see the battle. Then, shift as well as you can, and take care to let nobody know I am your father; for no mercy will be showed to any one so nearly related to me." Then the king gave him a purse of gold, and dismissed him.

'He followed the king's directions. And when he saw the battle was lost and the king killed, he hastened to London, sold his horse and fine clothes; and the better to conceal himself from all suspicion of being son to a king, and have means to live by his honest labour, he put himself apprentice to a bricklayer. But, having a competent skill in the Latin tongue, he was unwilling to lose it; and having an inclination also to reading, and no delight in the conversation of those he was obliged to work with, he generally spent all the time he had to spare in reading by himself.

'Sir Thomas said: "You are now old and almost past labour; I will give you the running of my kitchen as long as you may live." He answered: "Sir, you have a numerous family; I have been used to live retired. Give me leave to build a house of one room for myself in such a field; and there, with your good leave, I will live and die." Sir Thomas granted his request; he built his house, and there continued till his death.'

Dr Brett adds: 'I suppose—though my lord did not mention it—that he had his meals with the family, and then retired to his hut. My lord said there was no Park at the time; but when the Park was made, the house was taken into it, and continued standing until his—Lord Heneage's—father pulled it down. "But," said my lord, "I would as soon have pulled down this house"—meaning Eastwell Place.'

The good doctor, who, at the time he received this narrative from the Earl of Winchelsea, resided at Spring Grove, in the immediate vicinity of Eastwell, and had, therefore, every opportunity of acquainting himself with the current local traditions, as also of consulting the parish records and other relative documents, has left some notes anent this curious story. Dr Brett tells us: 'I have been computing the age of this Richard Plantagenet at the time of his decease, and find it to be about eighty-one. For Richard III. was killed August 23, 1485—which, subtracted from 1550, there remains sixty-five—to which add sixteen—for the age of young Richard at the time—and it makes eighty-one. But though he lived to that age, he could scarcely enjoy the retirement of his house above two or three years, or a little more; for I find that Sir Thomas Moyle did not purchase the estate

of Eastwell till about the year 1543 or 1544. We may therefore reasonably suppose that on his building a new house upon his purchase, he could not come to live in it until 1546; but that he continued to employ the workmen to build the walls about the gardens, and other conveniences away from the house. And until Sir Thomas took up his residence at Eastwell, he could not well have an opportunity of observing how Richard Plantagenet retired with his book. So that it was probably at the latter end of the year 1546 when Richard and his employer had the before-mentioned dialogue. Consequently, the artisan could not erect his house and have it dry enough to dwell in, till the year 1547. He must, therefore, have been seventy-seven or seventy-eight years of age before he had his writ of ease.'

When the letter embodying this tradition was printed by Peck, doubts as to its authenticity were somewhat freely expressed; but Dr Brett's account was verified, and his details defended, by the Rev. Samuel Pegge, and also by the Rector of Eastwell, in the *Gentleman's Magazine* for 1767. Mr Pegge calls attention to the statement in Drake's *Eboracum* that Richard III. certainly had an illegitimate son, who was knighted at York when a youth, by his father. Other writers of equal eminence have credited this strange story. Mr Jesse, in his *Memoirs of King Richard III.*, expresses a general faith in it. Sir Bernard Burke glances at the tradition in one of his charming books about the Aristocracy, and has the following general reference to the scattered remnants of the regal Plantagenet line: 'What race in Europe surpassed in royal position, personal achievement, or romantic adventure our Plantagenets, equally wise and valiant, no less renowned in the cabinet than in the field? Yet, as late as 1837, the great-grandson of Margaret Plantagenet, and heir of George, Duke of Clarence, was following the cobbler craft at Newport in Shropshire. Among the lineal descendants of Edmund Woodstock, Earl of Kent, son of Edward I., entitled to quarter the royal arms, occur a butcher and a toll-gatherer—the first a Mr Joseph Smart, of Hales Owen, Salop; the latter, Mr G. Wymot, keeper of the Cooper's Bank turnpike gate, near Dudley. Among descendants of Thomas Plantagenet, Duke of Gloucester, son of Edward III., we discover Mr Penny, late sexton of St George's, Hanover Square—a strange descent from sword and sceptre to spade and pick.'

Some writers, assuming the general truth of the assertion that Richard III. left an illegitimate son, contend that he escaped to the continent, and there passed the remainder of his days, an unknown stranger. Others, among them Rymer of the *Fœdera*, assert that he fell into the clutches of King Henry, and was quietly put to death; while many, with Walpole, have doubted whether he ever had an existence. But even the legitimate son of the crook-backed king by Anne Neville was never heard of in the reign of Richmond, though in his first year he was created Earl of Salisbury by King Edward; six years after, Prince of Wales by his father.

An almost impenetrable mystery surrounds the whole story. Time has woven about it the soft threads of tradition so thickly and intricately, that the historic truth is irrecoverably hidden

from the keenest eye. But the legend lives amid the green groves of Eastwell; and the tale of the bricklayer Plantagenet Prince passes yet from lip to lip, bringing back the memory of remote days.

'BABY.'

THERE is nothing like experience for teaching sympathy. I never properly sympathised with the poet Cowper's taste in the selection of his pets, until last autumn, when I was spending a few weeks in a country-house in Scotland. As usual, the gentlemen of the party spent most of their time in shooting; and one afternoon, as we were sitting round the fire in the twilight, one of them came in and laid something down upon the rug. What was it? We could not make out at first; but on stooping to examine, we saw that it was a baby hare, apparently only a few days old. It had been taken out of the mouth of a young dog, who had not learned that he must not touch live things.

It seemed terribly frightened, and was too young to eat or to lap; and as it was more than probable that the dog had injured it, we did not expect it to live till the morning. However, the little creature did survive; and now we felt that some way of feeding him must be devised. Would he lick drops of milk off our fingers? No; he utterly refused to do anything of the sort. Could we put milk into his mouth with a feather? No; we could not, and our attempts to feed him only terrified him. At last one of our party bethought her of a drop-tube belonging to a box of dialysed iron. This answered beautifully. We filled it with milk; our baby sucked it out with zest, and soon became lively.

He was the prettiest little creature imaginable, with his long fluffy coat, his black-tipped ears, and his soft brown and blue eyes. We tried to think of a name for him; but somehow he was always called Baby, and this seemed to suit him better than any more formal name.

On the second morning after his arrival, we brought him into the room where we breakfasted; and presently he crept into a straw bottle cover, where he remained with his face inwards. So, as he had chosen a kennel for himself, we allowed him to keep it.

He was very tiny when first we had him; he could sit quite comfortably curled up in one's hand; but he made rapid progress. One day we brought him in a daisy, some buttercups, clover, sorrel, and grass. He examined them with great interest, and tasted each one in turn, but could not eat them. However, by the next day he devoured such things eagerly.

He soon knew his friends, but would start and wince at a strange voice or face. Generally, he was very quiet during the day, either sitting looking out of his straw kennel, or fluffing himself into a round ball in front of the fire, only rousing

himself to lick any hand that caressed him. But in the evening he became quite boisterous; and it was as much as his affectionate nurses could do to get him to take his bottle and go to bed. He frisked about the room, sprang into the fender, and dashed under the grate, utterly unconscious of the risk to himself and to the hands that followed to rescue him. In a very little while, however, he learned that this was considered naughty; and if, when he was on the point of springing into the fender, we sternly said 'No! no!' he would obey, and resist what was evidently a strong temptation. But before it occurred to us that he would obey our voices, we used to put down our hands to frighten him away from the danger. Vain thought! He would turn round and lick them; he would nestle against them, or climb into them; but as to running away, no such idea ever entered his head.

One singular notion possessed his baby mind—that he could jump over the wainscot; and round and round the room he went, leaping against the wall, certain that at some point the wainscoting could be scaled.

He was daintily particular about his toilet. Even on the first day, when he was almost too weak to stand, we saw him feebly trying to remove the traces of the milk which we had spilt upon him in our vain attempts to feed him. He would sit up and wash his face with his paws just as a cat does, only that the long ears seemed very much in the way, as the tiny paw was passed from the back of the head to the front.

He was very fond of being petted; and when his favourite nurse came into the room, he would spring out of his straw-nest to meet her; and if, overcome by his fascinations, she sat down beside him on the floor, he would climb into her lap and nestle there. But perhaps his most endearing accomplishment was kissing. If we put our face near him, he would stretch up his head and cover us with kisses, the little busy tongue working away vigorously over lips and cheeks.

We were at length obliged to shut him up in a basket lined with hay, when we went out, as he was far too active to be allowed to remain at large. One day, when we opened the basket, he did not appear; and on removing the hay, we were seriously alarmed to find him lying on his side at the bottom of the basket, struggling convulsively. We lifted him out; but he could not stand, and rolled over on his side, where he lay motionless, his eyes glazing. We were convinced that his end was come; but we could not bear to lose our little pet without making an effort to save him; so, as a desperate remedy, we administered a few drops of wine. He took them readily, and the effect was almost magical. He struggled to his feet, and in a couple of hours seemed to be his own wilful self again. However, that evening, the convulsions returned, accompanied this time with great difficulty in breathing; and again we despaired of his life. But again he rallied, though this time less

completely, as he seemed to have almost entirely lost the use of his hind-legs. Yet his affectionate disposition was not a whit impaired. Although hardly able to stand, he would come tottering out of his basket to creep into the lap of his favourite nurse, and would stretch up his little head that she might offer her face to receive his gentle kisses.

The cause of his illness we could only conjecture. He used to rebel vigorously against being shut up in his basket; and we supposed that he had been springing upwards with all his might, as he was in the habit of doing, and had struck his head against the top of the basket with so much force as to injure himself. An abrasion on the top of the head confirmed us in this opinion. For two nights and a day he was a complete invalid, lying quietly in his bed, and turning away his head, with all an invalid's caprice, when pressed to take food. We were very unhappy about him, for we could do nothing for him. However, on the second morning, he revived wonderfully, and though very weak, he insisted on leaving his bed, and tottered about the room, his energy being not in the least damped by frequent falls.

But if he thought lightly of his falls, *we* did not, and again and again we put him back into the bed, which he was really too weak to leave. All in vain, however; out he was again directly, making his way to his favourite nurse, climbing on her feet, feebly jumping against her dress, evidently begging to be taken up. This was irresistible. He was lifted into her lap, where he nestled down with evident content.

The remedy which we found most effectual for him was fresh air. We took him out into a field near the house, and let him run about; and there some power seemed to return to his limbs. There was no fear of his running away. He followed us like a dog, and seemed only afraid that *we* should leave *him*. Later in the day, we repeated the experiment, carrying him out again in his basket. He seemed to remember how much he had enjoyed his run in the morning, and in sudden excitement he sprang from the basket before we had set it upon the grass. It was no great height; but his legs were too weak to support him, and he fell heavily. At the time, he appeared to be uninjured; he nibbled the grass, and stoutly resisted when we restored him to his basket and carried him back to the house. But in another hour, when we went to look at him, he was lying motionless in an unnatural position, and seemed to be suffering from a kind of torpor. Again we had recourse to stimulants, but this time with no result. About two hours later he died, apparently without pain.

It has been impossible to give an adequate picture of his fascinations. A more endearing pet cannot be conceived. Perhaps his most unexpected characteristic was his absolute fearlessness. From the time that he knew and trusted us, it was simply impossible to frighten him. Except during his illness, no noise, however sudden, seemed to disturb him; and he had been very sensitive to sound when we first had him.

His loss left quite a gap in our circle; our only consolation being that we had done our best to rear him to freedom, if he had chosen eventually to accept of it.

LIVE IT DOWN.

'There is a future for all who have the virtue to repent and the energy to atone.'—BULWER-LYTTON.

Yes, your fault has blurred your name;
Such disgrace is hard to bear;
Yet for you there is an aim,
Which should be your constant care—
You must learn to live it down.

True, the cloud is like a pall;
Error ever weaves such things;
But the sky is over all;
Morn has light upon its wings,
If you only live it down.

Yes, I know men look askance,
Dreading any pitch to touch;
Women, with a wondering glance,
Fear to pity overmuch;
Still, I tell you—live it down.

Patient be; with spirit meek,
Bear rebuffs a little while,
Till true friends shall kindly speak,
Meeting you with sunny smile,
Seeing you can live it down.

Labour! Oh, the worth of work,
Chasing bitter thoughts away!
Never any duty shirk
Which arises day by day;
That is how to live it down.

Ask forgiveness—and forgive,
Yet indulge not memories dark;
For you still may nobly live,
Though for once you missed the mark—
If you strive to live it down.

'Tis not easy? That I own;
What is easy that has worth?
Life is struggle, hid or known,
Even from the hour of birth;
Yours the task to live it down.

I have cheered you? That is well:
You will ponder on my words—
So you say; and I can tell
They have touched some answering chords.
Yes, I know you'll live it down,

Till the wrong may be forgot,
Or remembered only be
Like a half erased blot,
Which men do not care to see—
When indeed you've lived it down!
CAMILLA CROSLAND.

PRICE 1½d

A VISIT TO BERMUDA.

A FEW years ago, an advertisement appeared in the Nova Scotian newspapers offering to take passengers to Bermuda in a first-class steamship for fifteen dollars each. It now being the fall of the year, and we wishing to escape for once from the rigours of a Canadian winter, my mother and I seized upon this, as we thought, happy opportunity of going comfortably and cheaply to our native though long unvisited land. Reaching Yarmouth (Nova Scotia), whence we were to sail, we found that our vessel was small and not quite finished. She had figured for four years as a coal-barge; fifteen feet had now been added to her height—giving her a delightful roll—and various embellishments and conveniences made to her accommodation, all of which did not disguise the fact, that she was utterly unsuited to her proposed voyage. In Yarmouth, she was generally known as 'the Coffin,' in cheerful reference to the anticipated fate of her passengers and crew. However, we were in for it now, and started on our journey not without sad forebodings.

I think I never felt so amiably disposed toward any stranger as toward the huge black man who, at the end of our dreary voyage, came aboard our vessel, to pilot us to our desired haven in Bermuda—the largest of the islands, and the one of the group which gives name to the whole. He had been on the look-out for us for days, and had almost given us up for lost. The Bermudian pilots form a class of special interest. They are generally negroes, keen-sighted, active, powerful men, intelligent, and thoroughly acquainted with the treacherous reefs and shallows of their native coast. The law regulates their wages at from three to nine pounds sterling for bringing a vessel in from sea; one-fourth less for taking one out; and ten shillings a day when otherwise engaged. As it is impossible for any vessel to make her way unassisted into or out of the Bermuda islands, these pilots find the fees which they collect from the vessels, numbering one hundred and

fifty or so, that annually visit Bermuda, a comfortable addition to their living as farmers or fishermen.

What is called the main land of Bermuda is twenty-seven miles long, and at the widest part a mile and a half broad. Of what value, it may be asked, is this little estate in the ocean to England? Its importance consists in being a convenient place where distressed ships, especially ships of war, can be refitted and supplied with various kinds of stores. The floating dock which was built on the Clyde for Bermuda, is celebrated. Ships are floated into it for repair. Bermuda is also the winter station of the North American and West Indian fleet.

The harbour entrances here have of late years been considerably widened and improved; yet the narrow and difficult passages by which we approached Hamilton, made it at once evident to us why Juan Bermudez, sighting the islands in 1503, declined to sail nearer than was necessary to enable him to describe his discovery and take his ship away with whole ribs. The islands, geologically speaking, are believed to be in a state of subsidence and not of elevation, and investigation confirms the belief. In dredging a basin at Ireland Island for the reception of the floating dock, at forty-two feet below low-water mark was found a bed of red clay similar to the present surface-soil, with remains of cedar-wood and land fossils imbedded. Similar discoveries have been made at a less depth in other localities; and at Shelly Bay an old road can still be seen deep under water.

The approach to the islands is exceedingly lovely. To those who know the Thousand Islands in the St. Lawrence, the Bermudas will seem quite familiar, so strong is the resemblance. The first beauty that attracts the eye is the wonderful colour and clearness of the sea, like beryl, emerald, and sapphire sparkling on a silvery bed. Next, you are struck by the peculiar and beautiful appearance given to the landscape by the snowy whiteness of the square-roofed buildings—forts, barracks, churches, and houses,

gleaming like snow among the dusky sage-green foliage of the cedar. About three hundred isles and islets lay before us, only one hundred and eighty of which are recognised by government survey, and but four of any importance whatever. Three of these, Ireland Island, The Main Land, and St George's, are connected by bridges, and a magnificent causeway about half a mile long, which cost thirty-two thousand pounds. These connected islands are in the form of a horseshoe—St George's being at one end, the dockyard at the other, and Hamilton not far from the middle of the circumference of the shoe. The town of St George's looks pretty from the sea; but ashore, it is found to be small and crowded, and the streets mere lanes.

We landed at last in Hamilton, the seat of government, and a military station besides. Seen from the harbour, Hamilton is charming, lying nestled in the lap of hills clothed in dusky cedar, and crowned with forts; its principal streets shaded with spreading Pride-of-India trees, and its pretty white houses embowered in a wealth of foliage impossible to describe; oleanders, bright with blossoms, growing everywhere; lime, lemon, and orange trees gleaming with golden fruit in the gardens; and here and there a palm-tree rising in stately magnificence above all competitors. Ashore, I was not particularly impressed by any novelty except the rush-hats trimmed with white puggarees, worn by the men and boys; and the gay bandana handkerchief turbans adorning the heads of the coloured women. There is no local style of costume—commercial proximity to New York forbids that—and no obtrusive national characteristic but the particularly unpleasant nasal drawing speech of the lower and middle classes.

There was a great bustle along the wharfs and in the large, open, iron-roofed sheds which line the water-street, and serve as storehouses for the perishable produce brought to town when a vessel is loading. The vessels arriving generally bring supplies, and, owing to the perishable nature of their return cargo, make all haste to discharge and load again in the shortest possible time. Then, and then only, are the Bermudians, their negroes and donkeys, excited and in a hurry; then they work night and day, shipping potatoes, tomatoes, beets, bananas, onions, arrow-root, and other produce. They have a steamer from New York once a fortnight all the year round, and during the crop season, from April to June once a week. The value of these exports ranges from thirty to seventy-five thousand pounds yearly.

The soil of Bermuda is shallow, and not naturally productive; but being well manured, it produces very good crops of onions, potatoes, tomatoes, and other early spring vegetables, which receive a ready welcome in New York at the time of year when vegetables are scarce. Five or six species of palm grow well, the mountain cabbage-palms waving their beautiful feathery tops at a height of sixty feet, and measuring eight feet in circumference. The Avocado pear is a magnificent tree; so is the almond, and the one mahogany tree in the island; but the rubber-tree excels them all, both for size and the brilliant glossy greenness of its foliage. The finest one is forty-five feet high, twelve feet in circumference, and

shades seventy feet of ground. Roses are continually in bloom; and in spring-time, lilies grow everywhere, wonderful for size, fragrance, beauty, and variety. Jessamine, yellow and white, and orange-blossoms, always perfume the air. Geraniums and cactuses grow almost unheeded, except the night-blooming cereus, which is properly prized. It opens its lovely flowers, as big as a saucer, thirty and forty at one time, at about four or five in the afternoon. The flaming beauty of the ponsettia or 'burning-bush,' with its intensely scarlet terminal leaves, cannot be described; nor the soft beauty of the purple convolvulus. Even tea, coffee, and tobacco grow here; but only a few specimen plants are cultivated as curiosities. Oleanders, with their pretty pink, and white, and rose-coloured blossoms, are considered by farmers a nuisance. A distinctive feature is given to the landscape by the bananas and plantains waving their dark green leaves. Then there are the glossy and brilliant green of the orange and lemon trees; the palmettos, looking like bunches of fans with fringed edges; and the sharp-pointed leaves of the Spanish bayonet. Picture a Bermuda sky, more charming than the skies of Italy; a Bermuda sea, lovelier than any on earth; and Bermuda birds, especially the cardinal or Virginian nightingale, and the brilliant blue-bird, flashing like living jewels among the varied foliage, and you have a scene that cannot be surpassed.

In Bermuda the commissariat department is very imperfect. Grapes, for instance, are rather sour and scarce, being sold at a shilling per pound weight, though better kinds are now being grown for the American market. Bermuda bananas are good; but few are grown, and sell there at a penny a piece—dearer than in New York. Oranges, limes, lemons, pomegranates, Surinam cherries, grape-fruit, and many others, grow almost for the planting. Bermuda was formerly celebrated for oranges; but these and other kinds of fruit-trees have now been replaced by the less picturesque but more profitable onion! Tamarinds ripen, but are not cultivated. Melons, cucumbers, squashes, and all manner of choice vegetables, will thrive anywhere, but are seldom in the market. With all dainties of the earth at command, the Bermudians live far more scantily than do less favoured northerners. They have a fixed idea concerning potatoes, onions, tomatoes, and arrow-root, and appear unable to conceive or entertain any other. In flesh-meat the Bermuda market offers imported beef at a shilling a pound; native pork and poultry at eightpence and a shilling per pound. The poultry are not very good, having a tendency to become tall and thin—to go altogether into legs. Although Bermuda is by nature one of the most favoured spots in the world, it is also one of the poorest places to live in, on account of its wretched market. Clothing is dear, if the inferiority of its quality is considered; and the trifles of existence sell at the most absurd prices imaginable. The business of whale-catching was once actively pursued, though it has now almost ceased. We have seen at the same time as many as four whales spouting off the coast.

Ignorance amongst the coloured population, and intemperance amongst the lower orders of the

white people, are the bane of this fair spot. The population is fourteen thousand; their revenue from all sources over thirty thousand pounds, and of this nearly thirteen thousand pounds is duty collected on wines, spirits, and malt liquors. Rather more than a third is collected on all necessaries of life. There are a sufficient number of churches, and church-going is the fashion; but the coloured population, with much religiosity, or religious sentiment, are deficient in practical religion. Education is in an unsatisfactory condition, though it is being improved. A practical difficulty is the dislike of the whites to have their children taught at the same schools as the coloured children.

The climate of Bermuda is trying, but upon the whole good. It is sufficiently bracing in winter to make warm clothing necessary, but seldom cold enough for a fire. Few of the houses have grates or stoves in the parlours, and on chilly days, if kept indoors, one misses the cheery glow of the fire. The winter season is more like the Indian summer of America than anything else. When the south wind blows, man and beast are depressed. Horses trip, and their riders scarcely care to keep them on their legs. You go to bed in good spirits, and awake feeling like a washed-out rag. What is the matter? During the night, the wind has gone from north to south. You care for nothing and nobody. If enough energy be left to complain, you say with the æsthètes: 'Hollow! hollow! hollow! I despair droopingly. I am limp.' The dampness is another disagreeable feature. Boots and shoes and kid gloves, and everything that will mould, are ruined if not constantly worn or watched. Mould and cockroaches are great enemies to books, destroying their bindings very quickly. Ants and other insects are also trying to Europeans at certain seasons.

People in this mild and equable climate live to a great age. I saw several old men between eighty and ninety years old daily parading the streets quite as a matter of course. I also knew of numbers of very old people who were unable to walk out, but were in good health, and in perfect possession of all their mental, and most of their physical faculties. The people in general are healthy. It is a great mistake to suppose that yellow-fever has a home in Bermuda. It has been there several times, but on each occasion it originated from infection from outside.

It is probable that the good health of the Bermudians is largely due to their use of rain-water for all purposes, no other being available. In all the islands, there is neither lake nor rivulet. The rain is collected in large cemented tanks, built under the houses. Every roof has to do duty in collecting water for man and beast; and on the hill-sides you will see large spaces laid with stone, cemented and edged, from which the rain-water runs into large tanks lying below. These are generally built for some special purpose, as for barrack supplies or washing establishments.

One is surprised to see so little land under cultivation, cedar clothing the hills, with an occasional fiddle-wood and calabash tree, and oleander, tamarisk, and mangrove skirting the marsh-lands everywhere. Of the twelve thousand acres of land in the largest islands, less

than a third are in tillage and grass, the rest remaining in wood, marsh, and natural pasture. The fact, however, that most of the land is rocky, or very thinly covered with earth, accounts to a large extent for this apparently neglected state of cultivation.

The comparative absence of the smaller forms of animal life in Bermuda renders solitary walking an insupportable loneliness. In the sombre cedar woods, no bright-eyed squirrel sits aloft, and relieves the dreariness by his chattering and scampering; no song-birds, such as there are in England, fill the air with melody. Innumerable ants noiselessly pursue their endless labours; and no sound breaks the silence but an occasional chirp from a cricket or grasshopper, the hum of the cicada, and the occasional whirring wings of some silent bird. But when tired of quiet woods and gardens, the visitor in Bermuda will find much that is interesting on the sea-shores. The beaches are lovely, white as snow, and abounding in shells, no less than two hundred and sixty-nine varieties being found in this little isle. The seaweeds are wonderfully delicate and beautiful, and fish in endless variety swarm in the waters.

The government of Bermuda consists of a Governor, Legislative Council, and House of Assembly. The questions in debate are seldom of great importance, and the law-making is singularly cautious and tentative. New laws are put on their trial for a certain time before being finally approved. It is quite a gay place in winter, chiefly from the presence of vessels of war. The flag-ship gives dances on board; and the military officers stationed on the island get up paper chases on horseback, and other amusements. Still, life at Bermuda is rather dull, and not unlike that which is spent on board ship. You meet the same people every day and almost every hour. News comes but once a fortnight. No wonder that much gossip is talked, and monstrous inventions—called 'shaves'—are retailed which could have no possible foundation. Bermuda, though having certain advantages, is, on the whole, too far removed from the world's business and bustle—from telephones and telegraphs.

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

CHAPTER XXII.—'I MUST GIVE MYSELF WHAT LAW I CAN.'

THERE was a triumph in Garling's heart, though it had to share its throne with fear. He had fought against the world single-handed, and he was winning. Most crimes spring from egotism; and Garling's egotism was too great to leave the rest of the world the barest elbow-room. In his self-centred lonely life, this many a year, he had schooled himself thoroughly in that creed of Number One, which never needed teaching, and yet is taught so widely. You and I, who go about diffusing our sympathies on other people, miss the selfish, lonely raptures which warm the heart of the true egotist. He is not merely Gulliver in a Lilliput, to his own feeling, but he is so without the shadow of a reason; for

egotism and vanity may be, and often are, as separate as the Poles; and he knows himself no taller, no wittier, no wiser, no handsomer, than the rest of mankind; but he is *I*, and that stupendous fact raises him until his forehead strikes the stars. He is the central fact of the universe. Round him, men and circumstances revolve, ministering to *his* comfort, or afflicting *his* bones. If Nature raises a tornado, it is on purpose to wreck *his* paper-boat in a gutter. Should a trampled people, after long centuries of groaning, rise, and tear the oppressor from his place of power, it is to depreciate the value of *his* shares in the market. If anything affect him not, it is nothing, though it wreck or build a world. And when a man thus armed as in triple brass against the woes of others and their joys, is cursed with the good gift of brains, he may scourge a continent like the great Bonaparte; or wreck a business firm or so, and break a trusting heart or two, like Garling.

Mary's life had been on the whole so dull, that a little sunshine went a long way with her. Her father's unexpected yielding had let in so broad and warm a gleam upon her darkened life, that in the few hours that passed between his going and his coming, the girl's heart had opened like a flower. When he returned that night, sunk deep in his own secrecy, and a world's width away from her in his desert egotism, she gave him a shy and tender welcome, and fluttered about him with shy and tender ways. His heart had no door for her, and her poor little attentions stung him. He bade her go to bed; and when she obeyed him, he kept his place with folded arms by the dull fire, and hugged himself, and worshipped his own triumph. Suddenly, as if a peal of thunder had broken in on music, one thought crashed through him, and brought him to his feet. What if his employer had heard the talk in his room that afternoon! Amazing, that he had never thought of that before. It was enough—had he heard it—to arouse suspicion—though Trust had drugged her dead! Then fear took hold of him, and terror encompassed him. But he was not a man to be cowed, and could face even the phantoms from his own abysses; and his stout courage had beaten down his fears long before his nerves had ceased to twitch and tremble at them. In these matters the soul is like the wind, and the body like the sea. A child, chidden for a fault, falls asleep crying, and his pure mind runs into pure dreams, and his little heart is glad; but however the wind has fallen, the sea still heaves. You may hear him sobbing, though he smiles in his dream. And this elderly scoundrel's nerves still twitched and trembled, though his heart had grown stout again.

'If I am caught at last,' he said, 'and lose the game I have played for, what do I lose? The game, and only the game. Credit and liberty are mine still, and I am as well-to-do as honesty could have made me. There lies a quarter of a million safely housed in the Bank at Madrid, and accessible to me only. I am caught? Well and good. "Let me go again, if you please, or, though you hang and quarter me, you touch none of your money." Like other men, I have dreamed my dream, and I waken. Dream? It is no dream! What time remains for detection? I

can be away at any hour. Why stay at all? Why stay?'

He took a Bradshaw from the table, and studied it. There was a night-train set down there, leaving Waterloo Station for Southampton at half-past nine o'clock. A steam-packet for Cadiz, calling at Corunna, was set down for the ninth and twenty-fourth of each month. This was the twenty-second. He decided in a flash. Whatever pretence of business was to be done to-morrow at the office, he would do, and be away by that night-train. So then, at last, the time was here; looked forward to for years, and terrible now it came. As he sat beside the fire, he could see the office going on for an hour or two, even a day or two without him—everybody going on in the old routine; and then, scared and astonished faces, whisperings, fears, amazement, the principals summoned; a meeting with the Bank manager, everybody present grave and pale—and then, the crash, and he on the seas far out of reach, or safely housed at Madrid.

'Let me see,' he mused again, 'I must give myself what law I can.' He sat at the table, and wrote on the firm's paper one letter, running thus:

MEMORANDUM.

To MESSRS HUTCHINSON & Co., Liverpool.

Kindly read inclosed, and if it suit your views, indorse, and forward to Parrivacini & Co., Buenos Ayres.

Then, on plain letter-paper, he wrote, dating from his own chambers:

SIR—Pray, excuse my absence for a day. I am called away by private business of an urgent and particular nature.—Yours respectfully,
E. GARLING.

This epistle was intended for Mr Lumby, at the offices of the firm. He inclosed it in an addressed envelope, which he stamped, and left open. Then putting both it and the memorandum in another envelope, he addressed it to Messrs Hutchinson & Co. of Liverpool, and posted it at once with his own hand.

'Lawson will open it,' said Garling with a chuckle, as he turned homewards again, 'and thinking he sees a blunder, will post the inclosure at once. It will reach London, bearing the Liverpool post-mark, on Wednesday morning. If by that time there should be any suspicion, the post-mark will send them to Liverpool, whilst I am at the other end of the country.' Lawson was the manager of the firm to which this ingenious blind was addressed; and so excited was Garling's imagination at this time, that to think of Lawson was to see him seated in his own room, smiling gravely at the supposed blunder by which the wrong letter had been inclosed to him. The inclosure was not in Garling's usual neat and trim caligraphy, but was written at headlong speed, to look hasty and flurried. 'If it gives me but the day's law, it will serve my turn,' said the cashier as he stood before his dying fire again. The night was late by this time, and the tide of life in the City's streets ran low. He sat for awhile listening to the fainter tones of traffic, and 'busy with the trifles of his scheme. The railway station with its hurrying crowds, its gleam of light and gloom

of shadow, the guard's lamp waving, the train moving. The packet with its deck aswarm with life, the signal given, the hand-shakings and embraces; the ship in motion on dark waters, the lights of the town twinkling lower and lower, the long rolling of the open sea. He saw these things as he sat there. It was vain to strive to sleep, so he heaped on more coals, and sat out the night, busy with trifles all the time. The night wore by, and the dawn looked in miserably, and after a time, Garling heard the step of the laundress on the stairs, and retreated to his bedroom, where he bathed and shaved and dressed, emerging a little paler than ordinary, but not much. At the usual time, he went to the offices and to his own room there. The common routine of business done, he inspected the enormous ledgers which lined the room, mechanically pursuing the precaution of the previous night, whilst in his heart he laughed at it. But it weakened his knees beneath him to see that from one of those volumes the dust so carefully strewn had vanished. It was but a child's precaution, and yet it had discovered something.

'No creature has the keys but him and me,' said the cashier in a hoarse inward murmur. 'Is the hunt afoot already? Was that fool overheard here, after all?' And for all his courage, a cold perspiration burst out upon his forehead. But no man guessed his troubles, and no man watched his movements as he went in and out. He walked to his bankers. 'Why should I finesse and wait?' he asked himself, and went calmly in and demanded to see the manager, by whom he was received with marked respect. 'Do you know,' asked Garling, closeted with the manager, 'what people are saying about your affairs here?' The stroke he was prepared for was insolent in its audacity.

'What are they saying?' asked the manager in surprise.

'You will learn soon enough,' answered Garling. 'I am getting nervous, perhaps; but I have the savings of my lifetime here, and I can't afford to risk them. I want to close my account.'

The manager looked thunderstruck, and assured him that if any damaging rumours were afloat, they were utterly unfounded.

'Perhaps I am nervous,' said Garling; 'but I will close my account, if you please.'

The official demurred. It was not courteous or business-like. Fears were preposterous.

'I will close my account, if you please,' reiterated Garling. 'Or,' he added, 'I too may have occasion to spread the rumours.'

'Then by all means withdraw your balance,' said the manager, half wrathful, half amazed; and Garling received his money—five or six thousand pounds—his own, honestly his own every penny of it—put it, mostly in Bank of England notes for one hundred pounds apiece, into a black leather satchel, and went his way. 'I have shut his mouth,' thought the cashier with his own smile.

He went home, and found his daughter there, sewing. 'Mary,' he said, with placid gravity, 'I have a piece of good news for you.'—She looked at him silently, with a half-smile. She was beginning to think he meant kindly by her.—'I have found a place for Mr Search. It is in

Southampton. Will you come there with me to-night? I want to take a house for him, and give him a surprise when he comes down to his new situation.'

And this was the man she had thought so cruel! She would have overwhelmed him by her thanks; but he stopped her. 'You will know better in a day or two for what you have to thank me,' he said, meaning it quite truly, though the words carried a different sense to the speaker and the hearer. Then, locking his precious bag in his own room, he told her to have all things packed and ready by nine o'clock; and she having promised, he went to the offices again and bided his time. Cold and hard, and grimly self-possessed as he looked, he suffered torments of suspense and dread. But he bided his time, and got through his routine, and finally went his way, leaving the mine to explode and the House which had nourished him to fall in ruins. And there was not a touch of ruth, or pity, or repentance in him. At nine o'clock, he had a four-wheeled cab at his door, and the start was made in ample time. Familiar Fleet Street rumbled past him. He would never tread its pavement any more, but there would be rare talk of him there in a day or two. Let them talk—whoever chose! He had a quarter of a million sterling out in Spain, and he could afford to be talked of. Waterloo Road. The bridge with the river flowing dark below it. The station with its hurrying crowds. He had seen them all last night, in fancy so vivid they had all seemed real. He saw them in reality now, and they all seemed like a dream. Mary was already seated in the railway carriage, and he was standing at the door with the black bag in his hand. Except for his daughter, the carriage was untenanted, and he laid the bag on the seat, and for one moment looked round, asking dimly if this were really a farewell to London. The guard's lamp waved, the whistle sounded, and Garling's foot was on the step of the carriage, when a hand with a grip of iron took him by the arm.

'One word with you before you go, Garling.'

The cashier's head turned more like that of an automaton than of a living creature.

'Are you going?' cried the guard.

'No!' shouted Lumby, with his grasp tightening on Garling's arm. The two men—defrauder and defrauded—looked each other in the eyes. One read guilt, and the other suspicion bursting into certainty. The train started.

CONCERNING BOOK TITLES.

To most people it would seem an easy task for an author, after completing his work, to add to it a title that should clearly indicate the contents of the book. But only publishers and those connected with literature have any idea of the amount of time and trouble that is expended in the search for good titles.

Many authors cannot write in comfort until their title has been decided upon. Charles Dickens, after some days' deliberation, selected *The Chimes* as the title of one of his Christmas books, and we find him writing to a friend at this time: 'It's a great thing to have my title, and see my way how to work the bells.' Again, in 1859, he writes: 'My

determination to settle the title arises out of my knowledge that I shall never be able to do anything for the work until it has a fixed name; also out of my observation that the same odd feeling affects everybody else.' All his titles were carefully thought out, lists of such as seemed suitable being submitted to his friend Forster for approval. Before the title of *The Tale of Two Cities* was finally determined, the following suggested themselves: Buried Alive, One of these Days, The Thread of Gold, The Doctor of Beauvais, Time, The Leaves of the Forest, Scattered Leaves, The Great Wheel, Round and Round, The Tale of Two Cities, Old Leaves, Long Ago, Far Apart, Fallen Leaves, Five and Twenty Years, Years and Years, Day After Day, Felled Trees, Memory Carton, Rolling Stones, and Two Generations—no less than twenty-one different forms. *Hard Times* was chosen from the following list of fourteen: According to Cocker, Prove It, Stubborn Things, Mr Gradgrind's Facts, The Grindstone, Hard Times, Two and Two are Four, Something Tangible, Our Hard-headed Friend, Rust and Dust, Simple Arithmetic, A Matter of Calculation, A Mere Question of Figures, The Gradgrind Philosophy.

Unfortunately, all writers are not so careful in their choice of names, and titles are occasionally adopted which, instead of explaining the nature of the book, serve only to mislead the buyer. Mr Ruskin, who is noted for such unintelligible titles as *Fors Clavigera* and *Sesame and Lilies*, issued a theological discourse under the name of *A Treatise on Sheepfolds*, thus leading astray many librarians and indexers, as well as unsuspecting farmers and shepherds. The *Diversions of Purley*, at the time of its publication, was ordered by a village book-club, under the impression that it was a book of amusing games. The *Essay on Irish Bulls* was another work which was thought by some folks to deal with livestock. *Moths*, a novel by Ouida, has been asked for under the impression that it was an entomological work, and Charles Kingsley's *Yeast* by those in search of information on the *Torula cerevisiæ* or yeast-plant. Coleridge's *Ancient Mariner* was sold largely to seafaring men, who concluded from the name that it had some relation to nautical matters. Coleridge himself says: 'It is somewhat singular that the name of another and larger book of Mr Wordsworth's should also owe its circulation to a misconception of the title. It has been my fortune to have met with *The Excursion* at a great number of inns and boarding-houses in picturesque scenes—in places where parties go for excursions; and upon inquiry how it happened that so expensive a book was purchased, when an old Universal Magazine, an Athenian Oracle, or, at best, one of the Bridge-water Treatises, would do as well to send the guest to sleep, I was given to understand in those separate places that they were left by parties who had finished their material excursion, but, alas for their taste, had left their poetic *Excursion* untouched—uncut even, beyond the story of Margaret.'

The title of a book has often a curious history. First suggested by an author, it is very often altered by the publisher. There are many reasons for this. The publisher is thinking of a title that will sound well and take well with the book-

buyers; the author, of one that will be as appropriate to his subject as possible. There is another matter to be considered. Should a title be chosen which is already in use, the publisher may be called upon to alter it, even after his book is printed and bound. This is both troublesome and expensive. Yet, take what care he may, he may still fall into this error. Nor is this astonishing, when we consider the number of new books and new editions. In the year 1880 we had five thousand seven hundred and eight; in 1881 they numbered five thousand four hundred and six. There is no ultimate method of ascertaining with certainty that a title has not been already used; but the records of current literature may be consulted. We have the admirable *English Catalogue* of books, issued by Sampson Low since 1835; Whitaker's *Reference Catalogue of Current Literature*, with its index to thirty-five thousand works; the register of Stationers' Hall, and the British Museum Catalogues. Although not compulsory, yet, for the sake of evidence in confirming claims to the copyright of a book, it is necessary to have the titles of new works registered at Stationers' Hall, for which a fee of five shillings is charged.

Numerous instances could be cited of the author deferring to the wish of the publisher in the matter of a title. The gifted authoress of *Adam Bede* wrote the greater part of a long novel under the title of 'Sister Maggie;' but she readily changed this, at the wish of her publisher, to *The Mill on the Floss*. Archibald Constable suggested to Scott the title for his famous novel of *Rob Roy*. It is amusing to read Cadell's account of how the great publisher stalked up and down his room, muttering to himself, 'I am almost the author of the Waverley Novels,' when he had carried the day as to the title of a new novel, which was to be *Kenilworth* instead of 'Cumnor Hall.'

Again, many books are issued without an author's name, or under an assumed name. Whoever gives us a key to the many thousands of books which fall into this class, is worthy of our respect and gratitude. The late Samuel Halkett, of the Advocates' Library, Edinburgh, left a most important work in this department, which he had had in progress for about twenty years, in an unfinished state, entitled, *A Dictionary of the Anonymous and Pseudonymous Literature of Great Britain*. It was taken up, after Mr Halkett's death, by the Rev. John Laing; but he likewise did not survive to see its publication. The first volume was issued last year, and the remaining volumes are at present being rapidly pushed through the press under careful supervision. It will without doubt prove a standard work of reference, and the most important British work on the subject. An English gentleman calling himself Olphar Hamst (Ralph Thomas) has been engaged on a work of the same kind as that just mentioned, but more limited in scope, being a *Handbook of Fictitious Names of Authors of the Nineteenth Century*. In the course of his researches, he was puzzled to discover the real authorship of about one hundred and fifty books, each purporting to be written by 'A Lady.' All his efforts to pierce the veil of the anonymous being fruitless, he has ventilated his grievance by publishing a list of these books, under the title

of *Aggravating Ladies*. In this way he hopes to get further information on the subject.

The author of *Aggravating Ladies* has some sensible remarks about indexes. A good index is indispensable in every work of importance, and this matter is now so well understood, that it is usually very carefully attended to. In the printing account of the United States government for 1880, an item of seventeen hundred pounds was set down as paid for the compilation of an index for the Congress Reports. The British Parliament in 1778 paid twelve thousand nine hundred pounds for compiling indexes to the Journals of the House of Commons. A concordance to any great author is equally valuable as a work of reference. At one time, the Bible was the only book to which there was a concordance; Shakspeare, Milton, Pope, and Tennyson have now each been provided with one.

Olphar Hamst in his little book also throws out some useful hints as to the best methods of cataloguing books. The style and practice vary greatly in different libraries. It is well for rapid consultation that each work should be entered, not only under the author's name, but under the subject title, be it simple or compound.

It may be mentioned by the way that there are five libraries in the United Kingdom which are entitled, under the Copyright Act, to a copy of every new book as it appears. These are—the British Museum; the Bodleian Library, Oxford; the University Library, Cambridge; the Advocates' Library, Edinburgh; and Trinity College Library, Dublin. When it is remembered that, for each of the past two years, the number of new books published (exclusive of new editions) has amounted to some thousands, it is evident that the work of cataloguing must be continually carried on in those libraries that either purchase or receive new books. Certain American publishers have adopted an idea of some utility to librarians. Three or four copies of the title of a book are printed on the fly-leaf of the volume at the beginning, which copies can be readily clipped out and used as required. This saves transcription, as well as the danger of error in transcribing.

Amusing blunders occasionally happen in the citation of book titles. We have heard of a lady who wished to possess a copy of the late Dr John Brown's delightful *Hours Subsecivæ* ('Hours of Leisure'); but not having caught the title accurately, or failing to understand it, she ordered from her bookseller 'Dr John Brown's *Horrors of Society*.' Even booksellers have been known to get 'mixed' in the matter of titles and authors; as seems to have been the case with the one who advertised for sale, 'Mill on *Representative Government*;' ditto, on the *Floss*.' Titles are likewise not unfrequently treated in a very fragmentary and mutilated form. The late Rev. Dr Guthrie was not a little amused, when calling on his publisher, to hear a bookseller's boy shout out in his hearing for 'two dozen of Dr Guthrie's *Sins*.' The full title, of course, was *The City: Its Sins and Sorrows*. There is no harm in such abbreviations in ordinary conversation, or in buying and selling; but it is another matter when we come to record the title of a book in the catalogue of a public or private library. There, at least we expect fullness and completeness. Some accurate system

must also be adopted which will prevent the recurrence of such an odd entry as, 'Herself—The Memoirs of a Lady, by,' which Querard, the French bibliographer, found, much to his amusement, in the catalogue of a well-known French library. It is here the bibliographer can be of use, in order to reduce to system, and describe correctly, the various departments and subdivisions of literature. Research is thus rendered easier, and the student saved trouble and annoyance. French literature is peculiarly rich in works of this kind; and although England is still in the background in this respect, the reproach has been somewhat removed of late by the publication of such excellent bibliographies as Mr Shepherd has given us of Carlyle, Dickens, Thackeray, and Ruskin. This, unfortunately, is not a paying branch of literary work, and those who devote themselves to it require great enthusiasm and patience, wide and accurate scholarship, with the necessary leisure and opportunity for its execution.

The titles of magazines are a study in themselves; and while there is a dash of novelty about the names of some of the new-comers, many of the old and standard favourites still retain the name of the publishing house from which they first emanated. To change the title of a magazine means very often to kill it. The larger proportion of our popular literature and our best novels first find their way to the public through the pages of a magazine. The accumulated mass of material thus given to the public in a single year is very great, and any help in the unlocking of its treasures is of importance. Mr W. F. Poole, a well-known American librarian, made an attempt in this direction when he issued his *Index to Periodical Literature* in 1853, of which a new edition, very much enlarged, is now in progress, and in the preparation of which many British librarians have generously assisted, each taking in hand certain periodicals, and so dividing the labour.

The competition of modern times, arising from what we have above referred to, namely, the great number of books issued, necessitates the use of titles that shall be striking and attractive. As examples of these 'catchy' titles we may name Miss Braddon's *Dead Sea Fruit*, *Dead Men's Shoes*, *To the Bitter End*, *The Trail of the Serpent*; also Bulwer Lytton's *Strange Story*, *Night and Morning*, and *What Will He Do With It?* A glance at any railway book-stall will supply other examples by the score.

Brevity seems to be a necessary quality for a good title, and herein lies one striking difference between modern titles and those of a couple of hundred years ago. The same fondness for contrast and alliteration—often carried to an inordinate extent—may be observed in these old titles, but their length is generally much beyond our modern limits. Here are a few from the days of Cromwell: 'A Reaping Hook well tempered for the stubborn Ears of the coming Crop, or Biscuits baked in the Oven of Charity, carefully conserved for the Chickens of the Church, the Sparrows of the Spirit, and the Sweet Swallows of Salvation;' 'A Pair of Bellows to blow off the Dust cast upon John Fry;' 'High-heeled Shoes for Dwarfs in Holiness;' 'Hooks and Eyes for Believers' Breeches;' 'The Shop of the

Spiritual Apothecary ;' and a fitting companion to it, 'Sixpennyworth of Divine Spirit.' In 1683 was published, 'Hæc et Hic, or the Feminine Gender more worthy than the Masculine, being a Vindication of that ingenious and innocent Sex from the biting Sarcasms wherewith they are daily aspersed by the Virulent Tongues and Pens of Malevolent Men ;' and in 1749, 'A History of Filchum Cantum, or a Merry Dialogue between Apollo, Foolish Harry, Silly Billy, a Griffin, a Printer, a Spider Killer, a Jack-ass, and the Sonorous Guns of Ludgate.'

Alliteration is still a favourite device for securing an attractive and harmonious title ; but our literary ancestors seem to have revelled in its delights, scattering their 'similar sounds' with a liberal hand. Take the following : 'Seven Sobs of a Sorrowful Soul for Sin ; or the Seven Penitential Psalms of the Princely Prophet David, whereunto are also annexed William Humuis's Handfull of Honeysuckles, and divers Godly and pithy Ditties now newly augmented ;' 'A Plante of Pleasure and Grove of Graces ;' 'A Delicate Diet for Daintie Drunkards' (1576) ; 'Diet's Dry Dinner' (1599) ; and the famous little seventeenth-century bit of historical satire, 'The Staggering State of Scots Statesmen, by Sir John Scot of Scotstarvet.'

Although, to the uninitiated, it may seem that the title of a book is not of very great importance, and that a work of merit will meet with suitable recognition under whatever name it may be issued, it is a fact that the sale of many books depends to a great extent on the attractiveness of their titles. An example of this is seen in the case of *The Old English Baron*, a novel which ran through several editions, although, when previously published as *The Champion of Virtue*, it was found unsaleable.

OUR FRENCH PROFESSOR.

CHAPTER II.

As the Frenchman grew into favour and waxed brighter from day to day, I sank into dimness and obscurity. His great fervour, like that of the sun, put out weaker fires. A few days after his arrival, my violin became mute, and Emily and I only met at meal-times. Our duetting had been stopped by an insidious pleasantry. One evening almost all the household were gathered together in the drawing-room to hear me play some of my favourite solos. De Montgris had requested me to favour him with a proof of my powers. He sat at some distance from the piano, in the midst of a group of boys. Several pieces were played, and he complimented Emily and me in hyperbolical terms. I came to the last item of my programme, which was a variation upon *La ci darem*, a delicate embroidering of Mozart's lovely air. It was the composition of my old master Golfi, and he had taught me to play it well. Conscious of my ability, and wishing to show the Frenchman that he did not possess all the talent in the house, I threw my whole soul into the performance. Emily was rather nervous, and struck two or three false chords, which edged my teeth and infected me with some-

thing of her own trepidation. However, I went on pretty steadily until I came to a quaint minor episode. This never failed to excite in me the most delightful sensations. When half through, a suppressed burst of laughter came like a blow upon my ear. I almost stopped. My indignation was roused to the utmost ; for I saw at a glance that this merriment was due to some act or grimace of De Montgris. I stopped playing ; and could not help asking the French master if he were the cause of this rudeness on the part of the boys.

He made a queer grimace to the boys, which set them laughing again ; then, with the semblance of the frankest *bonhomie*, confessed that his conduct was unpardonable. He finished by saying : 'If Mr Bevan was not so peaceful as a Quaker'—which he pronounced Quak-ker—'I might expect him to demand satisfaction at the sword's point. He may be a *brave garçon*, as we say in France, but I doubt if he has much *courage*. He fights well, however, with a fiddle-stick ; and *chacun à son godd*.' The philanthropic shrug which terminated this impertinence was more than I could bear, and I rose and walked out of the room.

Thus ended our musical evenings.

The next morning, when De Montgris was taking his early walk—he rose always at five o'clock—I met him with a set determination. 'Monsieur,' I said, standing before him on the garden-path, 'you are an impudent scoundrel !'

He stepped back and glared at me. 'What do you mean, boy ?' he cried, waving his arms about menacingly.

'I mean to teach you good manners,' I continued, measuring every word.

'I will whip you like a poodle dog,' he roared, rushing up to me with uplifted arm.

In the twinkling of an eye, I had struck at him, and he was rolling on the grass-plot. He seemed to rebound rather than get up, and was upon me like a wolf, hitting, tearing, and pulling at me madly. He was very strong, and had he been cooler, might have done me a mischief.

I bent under him, and twisted my foot between his, and then made a sudden lurch forward, throwing him heavily upon the gravel-walk and falling upon him. The back of his head crashed as if it had been made of metal. I got up ; but he lay still. I stood over him till he opened his eyes, which he soon did. After half a minute, he looked at me with such unhidden hatred as ferocious animals display. 'I shall kill you for this !' he muttered.

'Pshaw !' I said scornfully ; 'bestow your Gascon threats upon those who fear you. I despise you, because I see through your artifices.'

'You will meet me this evening !' he cried limping towards me. 'Choose your weapon.'

'I fight only with one.'

'What is that ?' he demanded eagerly.

'This,' stretching out my fist.

'Brute, animal, *sauvage* ! Do you think I shall accept your mode of combat ?'

'Yes, Monsieur.'

'No ! I will pistol you, dog ! either face to face

or otherwise!' He was so agitated with pain, passion, and mortification, that he almost fainted while speaking. He reeled to a tree.

'I do not fear you, Monsieur, even if you are an assassin.'

My random words caused a marvellous change in his looks. The rage-fire went out of his eyes; he turned his head towards the house anxiously, then stared at me as if I had been a stranger.

'I am ill,' he whispered after a pause. 'We shall meet again.'

'When and where you please,' I said, turning away.

I heard him walk slowly in the direction of the house. I was too excited to go in; and as no one was about at that early hour, I began to move round the garden at a rapid pace. My trot became a run; and it was only when the perspiration streamed from every pore, that I began to grow calm. Never had I spent such a wretched night and stormy morning. Muscular fatigue alone could appease the nervous agony which beset me.

At length I went towards the side-door used by the servants; for De Montgris had for some reason shut the front-door. As I passed the spot where we had fought, I saw under a holly-bush a piece of paper like the fragment of a letter. I picked it up, and noticed it was in French. The first few words so aroused my curiosity, that—although contrary to all the codes of honour, written and unwritten—I read it to the end. Roughly translated, it ran thus: 'Barbier, thou hast been busy with many things in thy time; but Professor is a new trade. So the Demoiselle is charming. Has she a dower? Parbleu! thou art luckier than I, who regret the Mediterranean, with all its douleurs, in this cold, misty, selfish England. Send me fifty francs, or I must make a voyage to embrace thee *personnellement*. Address—JEAN BATAILLE, this time. I fear Pierre Robinet is already translated *Peau-rouge*. Despatch the'—

With this it ended. The fragment was obscure, and I could only guess that De Montgris might be an *alias*. But surely Dr Walters, the greatest stickler for propriety in the scholastic world, must have had the most perfect evidence of his French Professor's respectability. In my own case, he had required the most unexceptionable proofs of high conduct and attainments.

I was deeply prejudiced against De Montgris, and that doubtless made me wish that my evil opinion of him might be justified. I copied the missive in my room; and having made myself presentable to my class, I dropped it where I had found it, before entering the school-room.

My adversary was seated in his usual place when I went in, and appeared to be busily writing. He spoke shortly to the boys as they came in by twos and threes. They looked at each other, astonished at his taciturnity. They were more surprised some time afterwards when our youngest pupil, Charlie Simpson, came in saying: 'Monsieur De Montgris, is this piece of a letter yours?' The Frenchman looked up hastily; while Charlie continued: 'I found it in the garden just now. It is in French.'

'Have you read it, imbecile?' thundered De Montgris, snatching it brutally from the child.

'No, Monsieur,' answered he, half-frightened, half-indignant.

'So much the better—for you!'

Murmurs went round the room. What had happened to the gay Professor?

I watched him with lynx eyes. He was evidently alarmed lest any one had seen the letter. He became aware of my observation; threw a savage glance at me, then turned aside to his writing again.

For several days he was so quiet and reserved that everybody was bewildered; and it was generally agreed, either that he had received bad news from France, or that he was ill.

In the meantime I wrote to a friend, a young medical student at Paris, asking him to go to the Prefecture of Police there, and show them the copy I had taken of the letter. I also told him fully what had happened between De Montgris and myself. I may mention here that I had spent a year in Paris before joining Dr Walters; during which time my friend had shared apartments with me, and I had the most implicit confidence in his discretion. If De Montgris were an honest man, I would not have injured him by sinister inquiries for the world. I disliked him much, but in a straightforward fashion.

Weeks passed away; but, to my astonishment and no little annoyance, no reply came from my friend in Paris to my letter. My antagonist, in the meantime, had neither called me out, nor made any attempt to pistol me unawares. He began to assume his old ways with the boys, and soon became their delight again. He was respectful but sternly distant towards me. In compliance with the wish of Dr Walters, he gave Emily a lesson in French conversation every evening, Mrs Elphinstone being present. I could hear merry laughter proceeding from the drawing-room at such times, and it jarred upon me like a horrible discord. But my greatest pain was to see Emily walking round the garden with him in the summer eve. This was during the absence of Dr Walters in London, whither he had gone on literary business.

About this time, De Montgris came one day to my room, and begged a moment's conversation. I pointed silently to a chair; but he waved his hand, saying: 'I come to beg your forgiveness, Mr Bevan. I have treated you in a most unmannerly way. I made a most stupid mistake in supposing you a bumptious blockhead. I thought, too, you despised me for being a foreigner, and were trying to render me contemptible in the eyes of a lady. I find you to be a man of spirit and learning. I humbly crave your pardon. You will not refuse the *amende honorable*?'

I took his proffered hand, uttered a few commonplace phrases, and the interview terminated. The reconciliation was as hollow as the candour of diplomatists speaking 'peace' while their masters are adding to their forces by land and sea. There is no possible hypocrisy for the hate which is based upon the fundamental antagonisms of human nature. I could see that De Montgris was only stooping to conquer me by hidden craft instead of open violence. While speaking, his eye glittered snakishly, and his teeth gleamed with hoarded hatred.

The truce thus negotiated, I began once more to wake my violin to its wonted ecstasies, but

always in my own room. Emily rarely touched the piano, and I never saw her alone. Either she avoided me purposely, or her uncle had the wish to keep us separate. From an inexplicable change in his manner, I thought this must be the cause. The old gentleman was as kind to me as ever in school concerns; but he began to treat me distinctly as a subordinate. I was very unhappy at times, and thought that Emily, when our eyes met, also seemed unhappy. At table, she was always friendly and courteous, and I still sat in my usual place beside her. De Montgris, however, effectually prevented any conversation, by a continuous chatter, chiefly in French. Gradually, I found myself isolated and a stranger where I had been almost as in a loved home. The overmastering personality of the Frenchman detached all my friends, and left me only the gloomy companionship of my thoughts.

One morning, a few weeks before the summer holidays, Dr Walters sent for me to see him in his study. He shook me warmly by the hand, and began to compliment me upon the progress of the boys under my instruction. Then he stopped, and looked at me in a somewhat embarrassed manner. I looked at him, surprised at his unusual behaviour. At last he said: 'Mr Bevan, you are worthy of a superior position to that you occupy here; and it is my wish to promote your interests.'

I bowed.

'The fact is,' he continued, 'I have recommended you to my friend Sir Harry Wilford, as admirably qualified to superintend the education of his only son.'

'Then, I take it, you wish me to vacate my post here, Dr Walters?' I trembled with excitement.

'In your own interests, Mr Bevan,' answered the Doctor with something of his habitual pomposity.

'When do you wish me to retire, sir?'

'At midsummer, Mr Bevan.'

'Very good, Dr Walters.'

'I suppose you would like an introduction to Sir Harry Wilford without delay?'

'No, Doctor.'

'Why?'

'Because I cannot accept such an appointment. I have a stiff examination to prepare for, and I shall spend at least three months at my father's house in London after leaving you.'

The Doctor grew red, and something like a frown passed over his brow. Like all patronising men, he was irritated by an offer of service refused.

I cut the interview short, and returned to my duties.

ODD NOOKS OF LONDON.

How few of us, as we thread our way through the bustling throngs of London, know anything of the relics of old City life which lie so close to us! The builder and the improver are gradually sweeping them away, and before they quite disappear, let us explore them for an hour or two.

Not a hundred yards from the very centre of

our commercial whirl and hurry, still stands one of the old London coffee-houses. Cornhill rattles and groans within a few paces of its entrance, yet it is as quiet as a village inn at mid-day in summer-time. We enter through the pilastered, quaintly carved portico, and find ourselves in what might be mistaken for a good-sized meeting-house, were it not for the sanded floor and the unmistakable odour of beefsteaks grilling. There is not the smallest attempt at glitter or decoration about this little, out-of-the-way eating-den. High, stiff-backed divisions, with tables between them, occupy most of the space; a passage for the waiters, and a fireplace fitted with a gridiron capacious enough for any Saint Lawrence, fill up the remainder. Round the room runs a high wainscot, black with age, and polished with the contact of a century and a half of coats. Up in a corner is a parish boundary-stone, bearing the date 1730; and over the fireplace is a yellow, scarcely visible portrait of Addison. This is one of the last remaining old City coffee-houses, altered slightly to meet modern requirements, but retaining most of its original characteristics. One of the first proprietors made his fortune here during the South Sea Bubble agitation, and his descendants still carry on the business.

There are few capitals in the world where so many churches are crowded together as in London, and more especially in the City. We are told that eighty-nine were destroyed by the great fire of 1666; but as these were all rebuilt, their number added to the list of churches which were spared, would bring the total up to not far short of a hundred. Most of these are now sadly shorn of their ancient glory and importance. The London 'Cit' no longer lives over his counting-house or shop; he retires to his villa in the suburbs, and has gone so far afield, that the London suburbs may be said to extend ten miles in every direction. By eight o'clock at night the great City is a solitude, abandoned to policemen and housekeepers; but the City churches still remain, with their clergy and their officials and their fat revenues, just as in the days when the City was inhabited.

Let us suppose it to be Sunday morning, and visit one of these old City churches. The clang of bells from a hundred towers breaks the stillness of the air; but the streets are as free from traffic as those of Herculaneum; every window is shuttered and every door padlocked. The great door of our church is thrown wide open, as if to admit a large congregation. We let a file of neatly dressed charity-children clatter in, and then we enter. A magnificent beadle, gold-laced and silk-stockinged, ushers us into a pew—not one of your modern, third-class railway-carriage style of pews, but a good old-fashioned, high-walled, soft-cushioned box, with cosy red curtains round it, and a book-box in the corner as big as an overland trunk. It is a vast and beautiful church. In the gallery, upon which are emblazoned the Royal Arms, is a magnificent organ, profusely decorated in the Georgian style with huge masses of flowers and gilt cherubs;

the windows are filled with rare old stained-glass, through which the mellow sunlight falls on the sculptured forms of recumbent aldermen, clad in the doublet and hose of the sixteenth century.

Memorials of the old fellows deck the walls on all sides; and the thought which naturally presents itself to the mind, upon perusal of the numberless extravagant epitaphs and high-flown eulogies, is to the effect that those old days must have been really 'good.' Just over our heads is a tablet resplendent with armorial bearings, torches, and weeping children, 'Sacred' to the Memory of one THOMAS HOLLIBONE, 'long time Skinner and Alderman of this ward,' followed by a score of lines which place every conceivable virtue to the credit of the deceased Alderman's account. The fame of Thomas Hollibone has not come down to us; but reading the tablet by the light of the time, we can picture him as a sturdy-limbed, jovial-faced old fellow, free from anxiety and care beyond those inseparable from the skinner business, regular in his attendance at this church—perhaps in this pew—a profuse benefactor of the local charities, and the proud possessor of a buxom wife and half-a-dozen chubby children. John Gilpin we always accept as a typical London 'Cit,' and just such another as John Gilpin we can imagine Thomas Hollibone to have been.

But it is saddening to compare the London churches as they are with what they have been. In all these great buildings—St Michael's upon Cornhill and St Botolph's at Bishopsgate excepted—on a Sunday morning there are probably not a thousand people. Look around. In the gallery are twenty-five charity boys and girls with pink faces and pink bows. Here and there is an old man or an old woman, and no more. Yet, there are a clergyman, a curate, a large beadle, a clerk, and two pew-openers. Once a year the Lord Mayor and Sheriffs come here in state to listen to a sermon which was ordained to be preached here by the will of some old Elizabethan worthy. Upon this occasion there is a bit of a bustle; and perhaps a couple of hundred idlers come in to gaze at the gold lace and the white wigs and the great staves tipped with burnished brass; but on the remaining fifty-one Sundays, the congregation is made up as we see it now.

The service is a very short one—prayers, the Litany, a couple of hymns, and a ten minutes' discourse from the uppermost of the three 'decks,' as the clerk's box, reading-desk, and pulpit are irreverently termed. The reverend gentleman seems to preach at us—possibly from our evidently being strangers in the church; and this idea alone prevents us from yielding to a very strong inclination to sleep, an inclination fostered no doubt by the soft cushions, the subdued light, and the gentle drone of the preacher's voice. The large beadle is asleep in one cosy pew, the two pew-openers in another, and the charity children are fidgeting dreadfully with their thick boots overhead.

After the service, we 'assist' at the presentation to twenty-four old men and women—who have not been to church, but who have been waiting outside for the last ten minutes—of twenty-four loaves of bread and twenty-four shillings—a

loaf and a shilling to each—in accordance with the will of another old parochial benefactor long since deceased. We linger awhile amidst the interesting old tombs and effigies, until the beadle, who looks hungry, fidgets us out of the church into the clear sunny air outside.

There still exist here and there one or two of the genuine old City Inns. The *Old Bell* in Holborn is one of the best known specimens; the *Green Dragon* in Bishopsgate Street, still larger and still more perfect, was only pulled down a year or two back. But, to our mind, those which bear the most genuine stamp, the most unchanged, are in the Borough. This now unsavoury part of the capital has been from time immemorial famous for its inns. In the old days of coaching and posting, and in the still remoter period of pack-horses and foot-pilgrimages, every other house was a hostelry.

But three now remain; and two of these will ere long save the workman trouble, by tumbling down of their own accord, unless still further bolstered and patched up. It is historic ground here in the Borough, although the squalor, the filth, the smells, and the noise, are sufficient to repel any one but the most ardent searcher after Old London mosaics. As it has always stood on the great main road to the Kentish sea-coast, it is not surprising that memories of almost all our sovereigns, and of a very long roll of names eminent in history, are cherished by such of the inhabitants as in these degenerate days care to cherish memories of the days of old. In the bar of the old *Bricklayers' Arms* there hung a framed and glazed parchment, upon which were inscribed the names of all the great folk who had rested under the roof, from King Henry II. to the late Emperor Napoleon, including most of our great naval heroes, many of our greatest military commanders, and innumerable statesmen, ministers, judges, and authors. The old inn was demolished some time ago; and upon its site has arisen a gaudy gin-palace of the most approved modern type, somewhat similar to that which has supplanted the world-famed *Tabard*.

Hard by the modern *Tabard* is the *George Inn*. The casual passer-by might well fail to notice the old place; for the entry to it is down a dark cavernous passage, generally blocked up by a huge railway van. As we stand in the old courtyard, our fancy naturally takes us back to the past. From the *George* the Kent coaches started, and from the *George* to this day the Kent carriers run. With the burly farmers and hop-growers, the old inn was always a favourite; and the landlord says with pardonable pride, that during the season of the hop-sales, there are still customers who come simply because their fathers and forefathers had always patronised the inn. The sparrows hop about undisturbed in the great stables and coachhouses; the old galleries still run round three sides of the courtyard; but the rooms opening out upon them are silent and deserted. We can still, however, get a glass of excellent ale at the quaint, little, many-windowed, many-cornered bar, upon the shelves of which are bowls of fine old china and glass of quaint design; for which, the landlord says, he has been offered fabulous sums by virtuosi and dealers in bric-à-brac.

Scattered about the City of London, and,

strangely enough, in the most central parts of business bustle and hurry, are yet to be seen some of the residences of the old merchant-princes—converted into offices, it is true, but still retaining the melancholy air of departed grandeur. One in particular in St Mary Axe, hard by the celebrated church of St Andrew Undershaft, has always been a favourite of ours. It stands now alone amidst a mushroom colony of brand-new, stone-faced, marble-pillared edifices, and although externally there is little remarkable about it save its air of staid solidity, it is well worth a visit. Our ancestors liked a good entrance-hall to their houses, and in this old St Mary Axe mansion is a hall as big as many a modern drawing-room. The old leathern boxes in which slumbered the portly footmen, stood until quite recently, one upon each side of the fireplace; but a Hebrew dealer from Houndsditch bought them up, together with the old cupboard clock which used to stand at an angle of the stairs. A splendid staircase of real English oak, flanked by curiously twisted and carved banisters, leads from the hall to the first floor. It is none of your narrow, cramped, sharp-cornered, low-ceilinged staircases, but a good, broad, low-stepped, welcome-speaking flight—giving plenty of room for Mrs Alderman's furbelows, and ample space for two jovial fellows to reel up arm-in-arm after their third bottle in the dining-room.

They built with real ideas of space, air, and light, in those days, as we may see by the first-floor rooms, now cut up each one into two or three offices. There are deep seats in the windows; the mantel-pieces are carved into festoons of flowers and Cupids' heads; the paneling mounts half-way to the ceiling; the ceiling itself still retaining traces of mythological paintings. A back-door leads out into what once was doubtless a pleasant little garden, but which is now the playground for the housekeeper's children, the dust-bin of the establishment, and a favourite rendezvous for the cats of the neighbourhood. A plane-tree still flourishes amidst the grime and smoke; and we can picture the old proprietor sitting out here at evening, armed with his pipe of Virginia, and chattering to his spouse concerning the day's gains and plans for future enterprise. A firm of solicitors occupy Madam's bedchamber; and the housekeeper's family swarm about the innumerable garrets and closets up-stairs.

Close by the swarming, evil-odoured thoroughfare of Shoreditch, is an old City square. Once it was a favourite square, even an aristocratic square; now a deserted cluster of old houses, looking upon an expanse of grass-grown stones. The boys of the neighbourhood play cricket here on summer evenings, and Shoreditch sweethearts bill and coo here sometimes; but the sound of wheels rarely wakes its echoes; the policeman hardly condescends to include it in his beat; and the postman scarcely knows it by name. There is a tree at each corner—sad, funereal-looking objects, with black, drooping branches and withered trunks in winter-time; but in summer, casting quite a refreshing light over the square with their fresh green leaves. We wonder that so large a space has escaped the builder's maw; but are told that the whole square is in Chancery. And when we come to examine the sturdy old

houses with their carved portals, and their railings adorned with link-extinguishers and twisted ornament, we see Chancery very plainly written in the broken panes of glass, the dusky shutters, and the entire absence of life. We may pace the square for an hour and not see a solitary human being, nor hear a sound save the twittering of the sparrows and the seemingly distant hum of the streets. They tell of a murder committed in one of the corner-houses not many years since; and looking at it, we can quite believe that it would be long ere the shrieks of a victim could attract the attention of the outer world.

On exploring a fresh corner of the square, we come upon a brass plate with 'Wirgman, Beadle,' inscribed upon it. Wirgman, beadle, is smoking a clay-pipe, sadly we think, at the door. He quite starts as we address him. 'Yes,' he says in reply; 'it is a goodish time since any one worth mentionin' lived here. I live here, as the parochial beadle has always done since the nobles left the square; and I'm alone here, I am.—What about the murder?—Why, that was a matter of six year ago. Costermonger brings a young woman here—leastways over there at number twenty-sivin: nobody didn't interfere with them, 'cos it wasn't nobody's business. They gets a-fightin' over their drink, and Costermonger he ups with a knife he wos cuttin' cheese with, and stabs her. It wosn't found out for two days. He wos swung for it, he wos. Boys do say they sees the young woman's ghost a-walkin' about of a evenin'; but I ain't never seen it, and I don't believe it.—Yes, sir, a deal of fine folk used to live here, I've heerd—swells with long names, and carriages and footmen and sich-like. I've heerd old Parsons the sexton say as how he's seen twenty coaches at once in the square, and fine ladies in silks, no end. That wos fifty year ago.—Thank'ee, sir.'

Pugilism has received its deathblow, yet not far from the old square above described still exists one of the old 'fighting pubs.' It is a low-browed, shamefaced, little old place, in a narrow bystreet leading off the main thoroughfare of Shoreditch, only to be approached through scenes of such squalor, blackguardism, and misery, that we can hardly believe ourselves to be in the same parish as some of the granite palaces of our City princes. Yet in the days of Europe's First Gentleman, and far even into the reign of our present gracious Majesty, owners of some of the noblest names in the land, men with the bluest blood of England in their veins, nay, even bishops it is said, condescended to alight at the *Brown Jug and Glasses*, and pass an evening in the company of gentlemen whose talk was of hits from the shoulder, rats and gamecocks, and whose personal appearance certainly did not proclaim their connection with the Upper Ten. It is many years since a nobleman came here, and to the present generation of sporting-men the name of the inn is hardly known. The Rag-fair contingent are constant patrons of the Saturday night 'socials;' and the sacred memories of Aaron Jones and Abey Belasco are still silently drunk by gentlemen with prominent noses and much cheap jewellery.

Gradually the nooks of the old City are disappearing. Sometimes they die hard, more often they vanish wholesale. A new city is springing

up, more gorgeous, healthier, wider, and brighter ; but it never can possess points of interest so fascinating as those of the old City, with its quaint Coffee-houses, a further description of which we may give in a future paper.

SOME MORE QUEER DISHES.

REFERRING to former articles on this subject from the pen of Dr A. Stradling (*Chambers's Journal*, Nos. 933, 934), a contributor favours us with the following :

I have felt so much interested in reading Dr A. Stradling's papers, in which he gives us an account of various outlandish articles of food in use in different countries, that I feel tempted on my own account to mention some others which do not appear to have fallen within the range of his experience, but with which some twenty years of wandering in the antipodes has made me familiar.

What about worms, for instance? I do not mean the common earthworm, of whose agricultural efforts Mr Darwin descants in so learned and interesting a way. The earthworm, so far as I am aware, is not used as a staple article of food in any part of the world, but merely as a resource among certain tribes of Indians in time of famine; and is no more to be classed as an ordinary article of diet with them, than leather or canvas soaked in grease is with us; although both these, as well as other curious things, have often been had recourse to by cast-away sailors in the attempt to satisfy the cravings of hunger. The annelid I refer to is a marine species, and is looked upon as a great luxury by all the natives of the South Sea Islands. It lives in the coral reefs, and from the middle of October to the end of November, comes to the surface at sunrise in immense numbers; and great is the commotion and excitement among the people on the first appearance of the little stranger. Its arrival is always heralded by feasts; and during the Balolo or worm-month, all the natives wax fat and lusty on this their favourite article of food. The worm is curiously punctual in its appearance, almost to a day; and the months in which it appears are respectively called the little and big Balolo months. From early dawn on the expected day, scouts are placed on the hills and rocks commanding a view of the reefs; and no sooner does the long-expected shoal appear, than all the wooden drums in the neighbouring villages are sounded, and the entire population, big and little, young and old, sound and lame, rush to the beach; and while the able-bodied ones help to launch the canoes, the remainder set to work to dig and heat the ovens, or to discuss the chances of a good or bad worm season.

Fleets of canoes swarming with people, all armed with nets, at once put off, and scoop up the worms in huge quantities; they are then taken ashore and handed over to the cooks, who, after adding a certain quantity of cocoa-nut milk, specially prepared for the purpose, tie them up in young banana leaves, which have been previously passed over the fire to toughen them; and then bake them for some time in an oven, when they are ready for consumption, and are often sent round as presents to friends, just as game is among ourselves.

The annelid in question is of considerable length, greenish in colour, and has its long narrow body divided into numerous segments, reminding one somewhat of the tape-worm. When alive, it is of anything but a prepossessing appearance; but after being cooked, it more resembles spinach or fine seaweed in flavour than anything else. New-comers generally look upon the worm with horror. When I first went to the South Seas, I for a long while indulged in it under the impression that it was a vegetable of some kind; and when at last I heard of the worms, and made up my mind to taste them, I was much surprised, on being informed by an old 'beachcomber'—greatly to his amusement—that I had been eating them all through the season.

After worms, naturally come grubs, which are eaten in many parts of the world; and I remember once in New Zealand, when on a solitary expedition in the Bush, and finding myself short of food, making a very satisfactory meal out of some dozens of large white grubs that I found in an old kowai stump. I had often previously seen them eaten by the Maoris, and so knew their haunts, and by this means managed to satisfy my hunger to a wonderful extent. These grubs were a couple of inches or so in length, and when broiled on the ashes, were pleasant and well-tasted enough, more like marrow than anything else. But for all that, I was very glad on the second day to knock over an old weka—a kind of large rail—and so return to more orthodox fare.

Dr Stradling mentions white ants, but does not appear to have tasted them; allow me to tell him that they are 'dear little things' when properly fried in their own fat; plump, sweet, and satisfying; but curiously unlike ants in appearance. They are generally much esteemed as food by the natives of most of the countries in which they are found.

Porpoise and whale are also edible. I have tried both, and found porpoise liver excellent, and not to be distinguished from that of a pig. Of the flesh, however, I can hardly speak so highly, as it requires both good cooking and a long abstinence from fresh meat to make it at all palatable. Our ancestors, however, were of a different opinion, as in olden times it was highly esteemed, and we generally find the 'porpuss' figuring as a distinguished dish in most of the great banquets of the middle ages. But if the flesh of the porpoise is coarse and indifferent, that of his big cousin the whale is still more so; and the only time I tasted it, I found the meat exceedingly coarse and tough, as well as permeated with a nauseous taste and smell of train-oil. The tongue, however, is said to be much better; but it never came under my observation. Whale's milk is by no means to be despised.

Shark, the full-grown fish, is detestable—tough, and of a terribly rank smell. It is rarely eaten by white men except under pressure of extreme necessity; but the natives of the South Seas view it in a different light, and look upon the monster as a special luxury. Moreover, a New Zealand Maori knows no greater treat than a shark that has been kept until high enough to be unapproachable within twenty yards by any one but a native. But with a young shark of the brown variety the case is different, and I well remember, during a five months' residence at Opapa, having

many a good meal of fried cutlets cut from young sharks about four feet long; and at last we came to look upon it as the best fish there. In taste and appearance, it reminded one more of sturgeon than anything else. It likewise resembled the latter fish in having gristle instead of bones; and was much superior both in firmness and flavour to the British dog-fish, which I afterwards tried.

Locusts come in merely for a passing word from Dr Stradling, and he does not mention the right way to cook them. In the tropics there are several kinds of locusts; one in particular, a large green fellow that lives in trees. My native boy, I remember, put me up to the dodge of preparing them, which consists in first abstracting a certain black substance from the inside, said to be poison, removing the legs and wings, and then roasting the locust on the ashes, when they are not to be distinguished from prawns so treated; in fact he called them 'tree-prawns,' and assured me that in his country—the Solomon Islands—they were greatly sought after and much esteemed.

On many of the South Sea Islands there also exists a species of crab or lobster of most uncanny aspect, but delicious eating, and being both scarce and difficult to procure, is proportionably esteemed by the whites as well as by the natives. I refer to the *Burgus latro*, or robber-crab as he is called by the naturalists. He lives in a burrow of his own making, at the foot of a tree or among rocks, and daintily lines his dwelling with an immense quantity of fine cocoa-nut fibre, which he prepares himself from the husk. So well is this latter habit of his known, that any native in want of fibre for canoe calking, or what not, at once repairs to a crab burrow to procure it, and rarely fails in his object so long as he is able to get to the bottom of the burrow—which is not always the case, however, as the animal is generally astute enough to choose ground well intersected with large roots and rocks.

It is a very singular animal to look at, and more resembles the hermit crab out of his shell than any other of the species, having, like the hermit, an exceedingly tender and vulnerable abdomen, gathered up like a bag underneath him, and of which he is always uncommonly careful. He is armed with a formidable pair of pincers, of immense size and strength, by the aid of which he can carry off a cocoa-nut, husk it, and then break up the shell with the greatest ease. To any one who has noticed the great weight and size, and the extreme toughness and compactness of the cocoa-nut husk, it must be a matter of amazement that a creature so apparently insignificant as this crab should be thus able to tear open these husks with ease, and still more to crack the nut afterwards. He manages the latter operation by commencing at the soft hole—the one out of which the young tree finally issues, and out of which we are accustomed to drink the juice—into this he manages to insert the point of his pincers, and working on this, is enabled to break the nut to pieces.

In flavour they are, as would be expected from the nature of their food, very much richer and more delicate than our lobster, which has to content himself with more homely fare; and those I was able to procure were either split open

and fried in their own fat, or else baked in a native oven; which latter expedient generally answered best. I once heard of a native who, having found a very large burrow, incautiously put in his hand to pull out the occupant, when the wary crab caught him by the wrist in his terrible pincers, and in spite of his frantic efforts to get free, held him there for a whole day, until at last his friends, attracted by his cries, came to his rescue, and effected his liberation by digging down on to the crab, and attacking his abdomen with a pointed stick, when he at once let go his hold of his captive, who never afterwards fully recovered the use of the hand.

The *Holuthuria*, *Bêche de Mer*, or sea-slug, so much esteemed by the Chinese, is often met with in the South Pacific; and having always heard it very highly spoken of as a costly and delicious morsel, I had long looked forward with considerable curiosity to the chance of tasting it. In this, however, I was disappointed; for our cook, not being a Chinaman, did not understand how to manage it, nor did he at all fancy the look of the huge black slug I presented him with; and I only succeeded in inducing him to admit it within the sacred precincts of the ship's galley by lavish praises of its delicious qualities. The result of his operations on the creature was, however, a complete failure so far as soup was concerned, as after nearly twenty-four hours' boiling, the slug came out of the copper rather larger than when he went in, leaving behind him the most detestable compound in the way of soup I have ever tasted, being of an intensely bitter, disagreeable flavour, and not more to my liking than is the famous bird's-nest soup so much affected by the Chinese.

STUDIES IN ANIMAL LIFE.

FORETHOUGHT.

To make provision for the future is deemed one of the highest results of reasoning, and yet few human beings are so provident as are many members of the animal world. With domestic animals the power of taking thought for the morrow is frequently lost or deadened, from the fact that they have no need or liberty to forage for themselves; when, therefore, they do display any particular sense of forethought, it is considered the more noteworthy, and is the more likely to be recorded than if it were customary. By forethought is meant the results of self-reflection, as distinguished from that inherited impulse to provide for emergencies which is styled 'instinct.' Instinct teaches the bee to build its cell with geometrical exactitude, and probably impels the ant to bite off the germinating ends of the grains of corn it stores away for future use; but the anecdotes it is now proposed to cite appear to record actions of quite a different character—of a personal and specific, instead of an habitual and general nature.

Many of the lower animals, both individually and collectively, manifest remarkable forethought. Mr Jesse, to whom all lovers of natural history are deeply indebted, relates among other similar instances of reasoning amongst bees, the following: A large brown slug made its way into a glass hive, wherein the operations of the inhabitants could be seen. The bees killed the slug, but

being unable to get it out of the hive, covered it with a thick resinous substance called propolis, which they use for stopping holes and crevices in their hives, and so prevented it becoming a nuisance. On another occasion, this far-seeing settlement was invaded by a snail; but as this had a covering already, they satisfied their sanitary requirements by fixing a plastering of propolis round the edge of the shell. A regular fortification of this same useful substance, which these bees had built about the entrance of their hive the better to protect it from the attacks of wasps, was carefully preserved by Mr Jesse. By means of this defence a small number of bees could effectually guard the entrance. A still more remarkable instance of the reasoning power of the bee is recorded by Dr Brown in his book on that insect. Overburdened with honey, a centre comb in the hive had parted from its fastenings, and so pressed against another comb as to prevent the passage of the bees between them. This accident created great excitement for a time; but a remedy was soon devised for the public good. The ingenious little people constructed two horizontal beams between the two combs, and removed a sufficient quantity of the honey and wax above them to admit the passage of a bee, while the detached comb was secured by another beam, and fastened to the window by spare wax. When the comb was thus secured, they removed the horizontal beams first constructed, as being no longer necessary. Ten days were spent over this work, the conception and execution of which might have been worthy of any human engineer.

Another of Nature's little people noted for sagacity is the spider, and in the following story, related by the Rev. J. G. Wood, a truly marvellous proof of its talent is given. A friend of his, he informs us, was wont to shelter a number of spiders under a large veranda. One day the wind beat so furiously that, though protected by the veranda, the spiders suffered terribly, and in one case, some of the 'guy-ropes,' as sailors would call them, were broken, and the web flapped about like a loose sail in a storm. Instead of making new guy-ropes, the owner of the web lowered itself to the ground by a thread, and crawled about until it found some fragments of decayed wood. It then fastened its line to one of these fragments, reascended, and hauled the bit of wood after it to the height of nearly five feet, suspending it by a strong line to its web. 'The effect,' says our authority, 'was wonderful; for the weight of the wood was sufficient to keep the net tolerably tight, while it was light enough to yield to the wind, and so prevent further breakages. The wooden weight was just two inches and a half in length, and about the diameter of a goose-quill. On the following day, a careless servant touched it with her head and knocked it down; but in a few hours the spider had found and replaced it. After the stormy weather had ceased, the spider mended the web, cut the rope, and let the wooden weight fall to the ground.'

In his *Recollections*, the late Grantley Berkeley gives an interesting account of the sagacity of a beetle he observed near Bournemouth. This beetle was carrying home a dead spider to replenish its larder; though the curious adventures it underwent on its journey, even during the short

interval it was watched by the narrator, are too lengthy for reproduction here. Suffice it to say that carrying its burden some distance, it set it down on the path. 'On my hands and knees,' said Mr Berkeley, 'I followed him, and saw him quit the sandy path and climb up to the top of several sprigs of heather. From the last of them he quickly descended, and retraced his steps direct to where he had left the quarry, again possessed himself of it, and bore it to the foot of the sprig up which I had just observed him climb. He climbed to the top, and deposited the dead game in the fibres. This done, he again descended, and I saw him go off among the roots of the heather, as if in search of more game. By kneeling down and giving a very minute inspection to these several sprigs of heather, I discovered that the only one that could have held the spider had been selected. The beetle, in short, had hung up his dead game in the most artistic manner; and in order to test the soundness of his judgment, I waved the twig of heather to and fro as violently as any breeze of wind could have done, yet the spider remained unshaken.'

Few members of the animal world are so interesting as birds, and of few are such characteristic tales of prudential reasoning related. The general habits of many of our feathered friends are indeed suggestive of forethought; for instance, the rook, which, like some few other birds, retains a predilection for its old nest, revisits it at intervals during the autumn to repair it and strengthen it against the future season. Although each bird in building its nest follows the fashion which its parents pursued before it, and which its ancestors from time immemorial have adhered to, unexpected accidents frequently compel it to add to or alter some portion of the original design in a way that mere hereditary instinct could not have provided for. In her charming *Anecdotes of Birds*, Mrs Lee supplies a characteristic instance of the clever way in which a pair of goldfinches foresaw and provided against an emergency. The little couple had built their nest on the small branch of an olive tree, and after hatching their brood, found that their family dwelling was growing too heavy for the bough whereon it rested. They were watched, and seen to fasten the bending branch to a higher and stronger one with a piece of string they had somewhere obtained! By this contrivance their little home was completely secured.

Many instances of prudence exhibited by all kinds of birds are known, particularly during the process of incubation, when they appear to reason with more than ordinary intelligence. Mr Yarrell, who records the following typical tale, says the heroine was a swan of about nineteen years old, that had brought up many broods, and was therefore a bird of great experience. This interesting matron, at the period referred to, had four or five eggs in charge. She was observed to be very busy collecting weeds and grasses to raise her nest, and did not scruple to help herself from a quantity of haulm that was deposited near her abode. She laboured most industriously, and during the day contrived to raise her nest and the eggs in it two feet and a half! That very night there was a tremendous downpour of rain,

which flooded all the malt-shops and did great damage. The bird's prescience saved her eggs, which were just above the water; she made her preparations in time; but her human neighbours did not, and suffered accordingly.

Ravens are provident of themselves as well as of their young; and Mr W. Thompson, in his *Natural History of Ireland*, mentions some representative cases. In one instance, one of these crafty birds was wont to resort to the bird-traps the boys had set, and when he saw a little bird caught, tried to purloin it by turning up the trap. But the bird always escaped, the raven not being able to let the trap go in time to catch the prey. After several futile attempts, the raven, seeing a bird caught, hurried off to another raven and induced it to accompany him to the trap to turn it up; and as it lifted it, the other bore the poor captive off in triumph. Of another of these birds, Mr Thompson relates that when it had eaten its fill, it would hide the remainder of its food under loose stones close to a shed; and that he and other boys had repeatedly seen it, when hungry, go straight to the place where it had concealed its first morsel and eat it, and so on to the last stone in rotation.

Rats are very provident, both for their own benefit and the community's. Eggs, which they have been known to carry from the garret to the cellar, and other tempting foods, instead of being devoured instantly, are stored away for the hour of need. A writer in the *Quarterly Review* cites a noteworthy instance of the far-seeing sagacity of rats. A gentleman who fed his own pointers, noticed through a hole in the door that a number of rats ate from the trough with his dogs, which did not attempt to molest them. He resolved to shoot the intruders, so when next he served out the food, he kept the dogs away. Not a rat came to taste, although he could occasionally see them peering out of their holes, for 'they were too well versed in human nature to venture forth without the protection of their canine guard.' When the dogs were let in, the rats joined them, and fed with them as usual. The forethought of rats is indeed proverbial; and so far from being careless or selfish, these interesting little folks are proved to be dutiful children, careful parents, and friends in need.

Instances of canine economy are by no means rare; but the account of a dog-miser is, so far as our records extend, unique. Dandie, the animal referred to, was a Newfoundland dog, belonging to a gentleman in Edinburgh. It frequently had money given to it, because, besides other interesting signs of sagacity, it would go to the baker's and buy its own bread. But Dandie received more money than his needs called for, and so he took to hoarding it. This his master discovered in consequence of the dog appearing one day with a breakfast-roll when it was known that no one had given it any money. Suspicion aroused, search was made in the room where the dog slept. Dandie appeared quite unconcerned until his bed was approached, when he seized the servant by her gown and tried to drag her away, and became so violent that his master had to hold him. Sevenpence-halfpenny was found hidden in the bed. Dandie did not

forego his saving propensities even after this; but he exhibited a great dislike afterwards for the servant who had discovered his hoard, and in future was careful to select a different place of concealment.

Stories of dogs who carry money to shops in order to obtain food, are quite numerous; but the following incident, which was communicated to the *Bristol Mercury*, is, if authentic, probably unparalleled, even in canine records. A Bristol dog was allowed by a certain butcher to receive his meat on trust, the butcher scoring each pennyworth supplied on a board with a piece of chalk. One day our canine friend observing the man make two marks with the chalk instead of one, seized another piece of meat, and despite all the efforts of the butcher to detain him, ran off home with both pieces in his mouth.

But instances of forethought in dogs are so numerous, and everybody is so well aware of it, that there is no need to furnish further instances. Nor is it necessary to cite any of the many well-known anecdotes of the exhibition of this desirable quality in elephants and other of the higher animals; what has already been said being quite sufficient to prove our proposition, that forethought as the result of reason, and not merely as the result of hereditary instinct, is manifested by many members of the animal world.

A LULLABY.

SLEEP, my child! The shadows fall;
Silent darkness reigns o'er all;
Bird and bloom are lost to sight
In the folded arms of Night;
Stars will soon from cloud-towers peep,
While all Nature lies asleep.

Breathe thou softly! Rest is sweet
For tired hearts and aching feet;
No dull care nor toil is thine—
Nor sin, thou blessed child of mine;
Tranquil on thy soft couch rest,
With dreams of Heaven in thy breast.

Buds are sleeping; close thine eyes;
Waken with a soft surprise;
Greet the morning with thy smile,
And sweet prattle without guile.
Scents lie sleeping in the flowers;
Slumber till the daylight hours.

Sleep! Thy Father guards thy rest;
Lay thy head upon His breast;
Safer than these arms which hold thee,
His dear love will firm enfold thee;
Higher love than mine shall He
Give, beloved one, to thee!

Sleep! The waves have long been sleeping;
Angels o'er thee watch are keeping;
O'er us both the pale stars shine
With a radiance half divine.
Slumber, innocent and light,
Fall from Heaven on thee to-night.

OUR NATIONAL DEFENCES.

BY LIEUT.-COLONEL MITCHELL, COMMANDING ROYAL ENGINEERS, GUERNSEY.

'STEAM has bridged the Channel,' were the memorable words of Lord Palmerston, when he advocated the defence by fortification of the vital points of our empire—Dover, Portsmouth, Plymouth, Portland, Pembroke, Woolwich, Chatham, and Cork. Parliament voted about ten million pounds, afterwards reduced to eight millions; and under the able direction of the corps of Royal Engineers, the defence works, which were commenced about 1861, have been constructed.

Fortification is the art of so combining obstacles, natural or otherwise, that a small number of troops may successfully oppose the attack of a larger force, whether by land or sea. The object of fortification in England has been to secure the safety of our great dockyards, arsenal, certain harbours, and military positions; and to provide defensible barracks, bomb-proof hospitals, and suitable depôts for the security of warlike stores. The great advance made within the last twenty-five years in artillery, by which cannon can now throw shot and shell about five miles, rendered it necessary that this principle should be carried out in the defence of the places we have alluded to.

History, ancient and modern, gives many instances of the value of fortification. The massive works of Babylon and Nineveh have played their parts; Jerusalem with its watch-towers and ramparts kept at bay for many months the armies of Rome; Athens with its long walls baffled its enemies for years; and in more modern days, many an English castle held out bravely with a scanty garrison against a numerous enemy. The Duke of Wellington held his position in the Peninsular War for several months by means of the Lines of Torres Vedras; the fortification of Lucknow tended largely to check the progress of the Indian Mutiny; the earthworks

of Sebastopol enabled the Russians to keep the British army during one terrible winter in the trenches of the Crimea; and the Paris fortifications long arrested the advance of the victorious Prussians.

Many systems of fortification have been invented by different engineers. The principal ones are Vauban's first, second, and third system; the French modern system, Cormontaigne's, Carnot, Coehoorn, Montalembert's; and the German system. Theoretically, the works of defence are assumed to be built upon a level plain; but in practice it is the duty of the Royal Engineers to arrange their fortresses so as to adapt them to the defence of the position they are intended to protect.

Vauban uses bastions about four hundred yards apart, encircled by ditches and a path called a covered-way, where the sentries are posted, the whole being screened by a sloping bank of earth called a glacis. He invented ricochet fire, that is, the destructive art of firing shot or shell into forts so as to strike inside, and then bound along, destroying all in their path. The French modern system is merely an improvement on Vauban, effected by having large ravelins or projecting works pushing themselves forward upon the position it is intended to protect; and Cormontaigne made some modifications on both systems. The main principles of Carnot, a distinguished French engineer officer, were—to fire perpetually from mortars at his enemy, and encircle his town with thick masonry walls, pierced with loopholes, and protected, by being in the ditch, from distant fire. Coehoorn, a Dutch engineer, flourished in the seventeenth century, and invented a small mortar, long used in the British service for throwing small shot and shell; but the great credit attached to his name is due to his discovery that situations having aquatic sites must be defended on different principles from those on dry ones. He defends his town by placing a dry ditch within a wet one; and the fortresses of Breda, Namur, and Bergen-op-Zoom are good examples of his system. Montalembert advocated

a system of masonry for protecting his cannon; and he armed his fortresses with such a number of guns that their heavy concentrated fire would effectually keep a besieger at a distance. Some of his ideas have been utilised in the fortification of Coblenz.

The German system has been much used on the continent. Forts Alexander, Kaiser Franz near Coblenz, Rastadt, Antwerp, Wesel, and Erfurt, are fair examples; and its principles have been adopted in many of the new works in the United Kingdom. Its conspicuous features are the inclosing of a given space by the shortest possible line of works; the placing of isolated defensible works in prominent situations, defending the ditch by powerful detached towers called *caponnières*; placing casemated barracks, heavily armed, in the vital points of the position; and making free use of mining some portions of the ground round the fortress, so that if an enemy attempted to establish himself too near, he could readily be blown up. The system has the advantage that a small force can defend it, and the works being concentrated, are well under the supervision of the commander.

Since the fifteenth century, mining has played an important part in military operations. Such a system of attack is defended by counter-mines—that is, mines prepared beforehand; and in this country, but more especially in continental fortresses, counter-mines have been extensively adopted; the application of electricity to warlike purposes suggesting a ready means of exploding them at any given moment. The besieger is perhaps driving his mine towards the fortress; the besieged hears the sound of the underground working, and loads his counter-mine, already formed, with dynamite, gun-cotton, gun-powder, or whatever explosive he may have on hand, hurries away, and fires the counter-mine, which not only destroys whatever may be on the surface of the ground, but whatever underground mines lie within a given distance, called the radii of rupture. Both soldiers and sailors greatly dread mines, whether in fortifications on land, or torpedoes or fire-ships on the ocean.

One hundred pounds of gunpowder judiciously applied in blowing up houses or bridges, will usually stop the progress of a conflagration, or destroy any bridge so that the passage of troops or guns would be effectually prevented. The siege of Antwerp in 1584 is perhaps the most renowned instance of what a comparatively small quantity of gunpowder will effect. The Duke of Parma had thrown a bridge across the Scheldt, and the besieged were most anxious to destroy it. A hollow stone chamber was therefore built on a long vessel, and filled with gunpowder. The roof was loaded with huge slates and blocks of stone, the deck strewn with destructive missiles, the fuse lighted, and the vessel allowed to drift towards the bridge,

when an explosion took place with the most appalling results.

The *Times* 'Beemaster' has given amusing instances of the application of bees to defensive purposes. A small privateer manned by fifty men, but having on board some hives of bees, was pursued by a Turkish galley, manned by five hundred seamen and soldiers. When the latter came alongside, the crew of the privateer mounted the rigging with their hives, and threw them upon their foes, who, astonished at this novel mode of warfare, hastened to escape from the fury of the enraged bees. Another instance occurred, when a rabble at Hohnstein, in Thungaria, attempted to pillage the house of the parish minister; he caused some beehives to be thrown among the mob, who in consequence soon dispersed. Again, Vauban narrates how bees played an important part at the siege of Châté, in Lorraine. After a siege, the town was being stormed, and during the assault, the besieged threw a few hives of bees upon the heads of the storming-party. The little creatures stung the besiegers so dreadfully that they had to retire; and the historian tells that 'the bees were not the least cause of the siege being abandoned.'

The fortifications of the United Kingdom are armed with breech-loading rifle-cannon weighing from thirty-eight tons downwards; and with smooth-bore cannon from five tons downwards, and capable of projecting heavy shot and shell to distances up to five miles. The infantry who would man the ramparts in the event of war, are armed with the Henry-Martini breech-loading rifle, in which a sword or bayonet can be fitted. And at close range, case-shot—tin canisters full of bullets—can be fired from smooth-bore cannon with deadly effect against troops or boats.

Within the last few years, two inventions in the system of mounting guns have attracted much notice; we mean those of Captain Heathorn and Colonel Moncrieff. Captain Heathorn's gun is elevated or depressed on an imaginary pivot at its muzzle, so that it can fire from a casemate embrasure—a hole in the wall—or from a ship's port just large enough to allow the muzzle to enter. Colonel Moncrieff, by aid of a counterpoise, raises his gun high enough to fire, and then the shock of the recoil causes it to sink down like a 'Jack-in-the-box' into the original position under cover of the ramparts.

Dover being the nearest port to France, and connected by railway with the capital and principal towns, is an important military position. An enemy's force, if unopposed, could readily land there in a day, and march into London. Some of its fortifications date from the time of the Romans, and some were added during the Saxon and Norman epochs. The works were materially strengthened during the French revolutionary war, and were divided into two sets—the Western Heights Defences, which contain Archcliff Fort and the Drop Redoubt; and the

Castle Defences, including the new castle Hill Fort, the town lying in the valley between them. The proposed Channel Tunnel, which has recently attracted so much attention, starts from Dover. The Royal Engineers can no doubt erect such powerful fortifications as to effectually guard the entrance to the Tunnel, and a system of mines can be readily arranged to destroy it from the British shore.

Portsmouth, with its roadstead of Spithead, lockyard, and convict establishment, lies upon the route an enemy might select in marching upon London from the south, and has consequently been strongly fortified. Spit Fort, Horse Fort, and Nomans Land Fort, which occupy shoals in the sea near the entrance of the harbour, are partly plated with iron, and contain numerous thirty-eight and twelve-ton guns, which would speedily settle the fate of an enemy attempting to force the passage to the harbour, or burn the dockyard and town. Hurst Castle and other powerful works defend the passage to the Needles; and numerous forts and batteries cover the landing-places on the Isle of Wight; while a military road has been formed on its southern shore. The Gosport advanced lines, extending from Portsmouth harbour to Fort Gomer on the Solent, defend the position to the westward; while the chain of powerful forts running along the ridge of Portsdown Hills, about seven thousand five hundred yards from the dockyard, prevents the possibility of an enemy planting his guns on the summit. The rear of the Gosport position is defended by the Stokes Bay Lines; the Hilsea Lines defend the dockyard on the eastward; while the guns of Southsea Castle, Lumps Forts, Eastney Batteries, and Fort Cumberland, would give a good account of themselves in bearing upon the entrance to the harbour.

Plymouth, our western naval port and anchorage, with its magnificent harbour, has been rendered secure by defending the entrance to the Hamoaze, thus repelling attack by outsiders, and insuring the security of the Sound as an anchorage for our own ships, by means of a battery on the Mount Edgcumbe estate; another at Drake Island; a third on the Breakwater, and by redoubts at East and West King. To prevent a land attack between the east and west, the Staddon Heights have been occupied by suitable fortifications; and the Devonport lines, Plymouth Citadel, and certain smaller works in the direction of Mount Pleasant and Stone House Hill, protect the east of the Hamoaze. The north-eastern defences extend from Fort Effort on the right to Forts Agaton and Ernsettle on the left. Portland, with its artificial harbour and convict establishment, has been defended by turning Verne Hill into a second Gibraltar, and placing Jetty Fort close to the town of Weymouth, and another work at the end of the Breakwater.

Pembroke, on the west of our network of railways, contains a good dockyard, and lies upon the beautiful harbour of Milford. For the benefit of hostile ships forcing their way into the harbour, a powerful casemated bomb-proof fort, armed with heavy cannon, has been built upon Thorn Island, at the mouth of the harbour, where guns cross fire with those at West Block House and Dale Point at about one thousand yards. To prevent the dockyard being bombarded

from the sea, South Hook Point casemated barracks have been built, with batteries on its front, so that the artillery can sweep down the haven. The Stack Rock, lying in the haven, has been strongly fortified, a casemated battery of heavy guns placed at Popton Point, and another at Hubberstone. The dockyard is overlooked by two martello towers; and Fort Defensible stands on the ridge above the town.

Woolwich, the headquarters of our royal artillery, and our only arsenal, is, unfortunately, commanded by Shooter's Hill, at about two miles' distance; and the strong fort recommended by the Royal Commission in 1860 to be placed on its summit, has not yet been commenced. If a battle were lost to the southward of London, the fort at Shooter's Hill would cover the passage over the military bridge formed near. Without such means, our army might be shut up in the district to the south of London, and communications with the interior of England cut off.

Tilbury Fort, on the Essex shore, aided by the guns of New Tavern Fort Coal House Batteries, Shornmead, Cliffe, and Gravesend, and possibly by an iron-plated steamer anchored in the river, would effectually defend Woolwich in this direction, and also protect our national powder-magazine at Purfleet. Chatham, a valuable dockyard on the Medway, is protected by its old lines, encircling the gun-wharf, dockyard, and certain barracks, and commands the only bridges in the district over the Medway, and is connected by railway with London, Woolwich, and Dover; so that if an enemy landed within twenty-five miles to the east, or fifty miles to the west of Dover, he could be attacked by the garrisons of both places. Forts Hoo and Darnet would bring a heavy artillery-fire upon steamers attempting to pass to Chatham; and Upnor Castle, which repulsed the Dutch fleet in 1667, might still aid in carrying out the old inscription of the time of Queen Elizabeth:

Who gave me this sheen to none other end
But strongly to stand, her navio to defend.

Cork, our only Irish naval station, has its capacious harbour, where a fleet could remain to act on the defence of our coasts, protected by Forts Camden and Carlisle at the entrance, and by Fort Westmoreland on Spike Island. The Royal Commission that reported about 1860 on the defenceless condition of the kingdom, recommended an inland arsenal at Cannock Chase, Staffordshire, in the centre of the network of railways and canals, and well retired from the coast, so that if Woolwich were destroyed, the country might have another arsenal. The work has not yet been commenced.

Those who object to fortification, might do well to study the famous letter addressed by Lord Overstone to the Royal Commission in 1860, when asked to favour them with his views 'as to the immediate effect upon the commercial and monetary affairs of this country that would follow the landing of an invading army, without reference to its ultimate success.' His lordship replied: 'I cannot contemplate or trace to its consequences such a supposition as that London be occupied by an invading army. My only answer is: *It must never be.* Under the most favourable supposition, the general confusion and ruin

which the presence of a hostile army on British soil must produce, will be such that it would be absolute madness on the part of the government and people of this country were they to omit any possible measure of precaution, or to shrink from any present sacrifice, by which the occurrence of such a catastrophe may be rendered impossible. The limited extent of the country would seriously restrict our means of protracted defence. The immense amount of our accumulated capital would afford to the enemy the ready means of levying his heavy exactions. The complicated and very delicate network of credit which overlies all the multitudinous transactions of the country, would vibrate throughout upon the first touch of our soil by a foreign invader, and would, in all probability, be subject to a sudden and fearful collapse; while the confusion and distress produced among the labouring classes would be truly fearful. Millions of our labouring population depend for their daily maintenance upon trading and manufacturing enterprise, the vital principle of which is the undisturbed state of public order, confidence, and credit.'

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

CHAPTER XXIII.—RUNNING AWAY FROM DISHONOUR.

VAL STRANGE sat alone in a smoking-carriage in a train bound for Southampton, and whither he might go from that starting-point, he neither knew nor cared. One place was likely to be as blank and empty as another for many a year to come, he thought, and the world held nothing worth doing or seeing or thinking about. He was sore against himself, for it seemed only his own blunder which had driven him away. He was angry with Gilbert for having betrayed his confidence, and angry with himself for having put it in his power to do so. He confessed that if he had warned Gilbert, the secret would have been safe in his hands; and he was very angry about his own stupidity. Once or twice his heart told him, 'It is better as it is;' but on the whole it was not wonderful that this reflection had little power to soothe him. Reginald's declaration about their being 'both men of honour,' hit him hard. He had been honourable once, and he would have scorned in another the action which he himself had taken. He had planned to undermine his friend in the affections of his plighted wife. That was the plain English of the business, and black enough it looked when set forth simply so. But then came his excuses. Egotism, parent of dishonour and crime, put forth her plea. *He loved, he suffered, he would be miserable for life.* Not even yet had Egotism power to blind him altogether, and he saw that there were two sides to this, as to most other matters. Gerard loved, not so deeply as himself perhaps; for who could credit that?—but still he loved her, beyond doubt, because no man could help it. And Gerard, if robbed of her,

would suffer too, though he would learn to live it down. Wonderful how easy it seemed, how likely it seemed—this learning to live it down—in the other man's case; how bitterly hopeless and dreary a prospect it presented in his own. This faculty of seeing your own side big, and other people's little, it is which makes wars, breeds hatreds, fills jails, and feeds the scaffold. The immortal precept which bids man love his neighbour as himself, aims a blow at crime, which, if it took effect, were fatal; for it strikes egotism dead; and the thief would no longer steal, if he, ignorant, vicious, and ugly, could be brought to know that the philanthropist his victim, lovely in men's sight, learned and pious, has claims upon the world which are equal to his own. But he dreams not of it, and does not indeed properly realise any other human creature's existence. Other men are not alive to us, and therefore we injure or neglect them. They go about, assuredly, and conduct business, and marry wives, and rear children, and what not; but it is only *you* who are really alive in the middle of these *simulacra*, only *you* who love thus passionately, who suffer thus profoundly, who dream thus loftily. It was not only the half-cured blind man in Palestine who saw men but as trees walking.

Even in our bitterest hours we do things which are habitual to us. Val's cigar-case was his one source of comfort at all vacuous times, and he went to it now. Mechanically he drew it from its place, mechanically chose a cigar, mechanically felt in his pockets for a vesta. First here, and then there, his fingers strayed, until his mind woke up and took part in the task. The little silver box was lost, or left behind, and it became suddenly a matter of the gravest importance that poor Val should smoke. And here was a twenty miles' run before him without a pause, and no chance of a whiff for an eternity of at least five-and-twenty minutes. Cruel Fate! His anger at this circumstance became at length comic to himself, and he took to chaffing himself drearily about it; but he looked half-a-score times out of the window for the station within that score of miles, and consulted his watch again and again. Time had never seemed to hang more heavily. The train reached the station at last, and Val's carriage stopped opposite a refreshment-room. He leaped from his place to the platform. 'No time here, sir,' an official on the platform warned him. 'All right,' cried Val; and dashing into the refreshment-room, called for a box of vestas, and being most leisurely supplied by the superior person in charge of the place, rushed back again to find the train in motion. 'Here you are, sir!' cried the guard; and he made a dash for the carriage-door held open. The guard slammed it noisily behind him, and he had re-caught the train by a fraction of a second. But this was not his carriage, and indeed not a smoking-compartment at all; and to make matters worse, it was occupied by a lady in mourning, who sat veiled in one corner. Val within himself spoke evil of the guard, and greatly fumed and fretted. The night was cold, his rugs were in the other carriage, and their sudden loss rendered him doubly susceptible to the chilly air.

'Ugh!' said the ill-used creature, folding his overcoat about his legs and settling himself in his corner as comfortably as he could. Just then a sound struck his ear which made him worse content than ever. The lady in the corner was crying, sobbing outright as if her heart would break. 'More misery,' said Val to himself, as though it injured him that his fellow-passenger should be unhappy. But he was naturally soft-hearted, and could not bear the sight of any other creature's trouble, least of all a woman's; and seeing how the whole slight figure heaved and shook with grief, he felt a swift touch of pity, and half involuntarily moved towards her.

'I beg your pardon, madam,' said Val, baring his head, 'but you are in trouble. Can I do anything for you?'

The poor thing only wept the more; but by-and-by stealing a look at him from under her veil, saw a handsome face full of pity looking at her with tender and troubled interest. 'I have lost my father,' said a girlish voice, so broken with sobs that it took half a minute to say it.—Val looked at the deep mourning in which she was dressed, and nodded sympathetically.—'No,' she sobbed anew, reading his glance; 'that is for my mother. I have lost my father at the railway station.'

'Oh!' said he, 'your father was travelling with you?'

'Yes,' she said. 'The train started, and left him behind.'

'Oh,' said Val; 'he will come on by the next train. You mustn't be alarmed.' She was quite a child, if he could judge from her figure, her voice, and this abandonment of grief at so small a disaster. 'Allow me to take care of you. How far are you going?'

'To Sou-Sou-Southampton,' she said, and burst out crying anew, as though that made it worse than ever.

'Will anybody meet you there?' asked Val. 'Have you friends in Southampton?'

'No,' she answered.

'Never mind,' said Val soothingly. 'It will all come smooth by-and-by. Papa will come on by the next train; and you must stop at an hotel to-night, and meet the train in the morning.' This programme seemed perfectly satisfactory to him; and his voice and face did something to comfort the girl, though what he said did little. She put up her veil after a time; and he saw that she was somewhat older than he had fancied, and pretty in spite of her flushed cheeks and tearful eyes.

'But,' she said, looking piteously at Val, 'I ought to have a ticket?'

'O yes,' said Val, 'you ought to have a ticket.'—And she wept anew.—'Never mind,' he said again. 'Don't cry. You can pay at Southampton.'

'But,' she sobbed, in the simplicity of grief, 'I haven't got any money!'

'Oh,' said Val, 'you haven't any money? Never mind. Don't cry.—Hillo! Here's another station.—Excuse me for a moment.' Out he ran; and accosting his servant, who was seated in an adjoining carriage, ordered him to transfer his belongings. He handed one of his rugs to his companion, and bestowed the other on himself; and he comforted her with sherry and sandwiches

until she began to cry quite contentedly, and after a long time ceased to cry at all, only the waves could not settle at once, and a sob rose now and again. It was evident that she was not exactly a lady, and evident also that she was amazingly ignorant of the world. She was very frightened at the tunnels and bridges with their sudden deafening roar; and Val's kindly comments on this alarm of hers elicited the fact that she had never travelled by rail before. When, before entering the terminal station, they were called upon for their tickets, she permitted Val to pay for her journey with no more remonstrance than a wistful look conveyed. She stood on the Southampton platform a few minutes later, and gazed about her in pure bewilderment and terror, clinging to Val's arm. 'Here,' said Val, looking back into the carriage, 'you have forgotten your bag. Have you any luggage?'

'I have a box,' she answered, accepting the black bag from Val's hand; and away she went by his side to the luggage-van; and the box being extricated and recognised, her protector rather enjoying the situation, led her to an hotel, ordered a room for her, and had a cup of tea sent up to her. He promised to meet her at breakfast in the morning, and then sat down in a private room and smoked his fill, and was miserable. The fact of having done something for a fellow-creature in trouble was not without its comfort for him; but he came back to his own griefs. Going away, an exile, leaving love behind! That millions had suffered so before, was no salve to his sore heart. Running away from dishonour—that was something!—but his will was not in it. He would have stayed behind, had he taken his choice, and have drawn Love to his bosom though she brought dishonour with her. And that was a sad condition for a man to have come to. He had still enough honour left to see the disgrace to which he had been hurrying. 'Thy grace being gained'—he was sitting with the sealed envelope, which held Constance's portrait, in his hand, and so had the line before him—'cures all disgrace in me.' He knew that he would have to travel far before he could find a poorer sophistry than that. His conscience scorned it as a pun with no meaning; but Will hugged it, and tried hard to believe in it. It was significant of some power above himself, that he laid down the envelope without opening it, as he longed to do.

Meantime, Hiram's little sweetheart slept soundly, and dreamed of Hiram, and of this wonderful, kind, good, new creature who had come into her life, and had been so generous. I do not believe that she had ever conversed with a gentleman until that evening, and she had been somewhat in awe of his splendours—the magnificent diamond on his white finger, his eyeglass, his moustaches, his little pointed sixteenth-century beard, his fine clothes; for Val was always a dressy man, though he never overdid the thing. And then he had made absolutely nothing of money, of ever so much money, and he kept a manservant, who dressed as well as Hiram, and looked almost as grand. The hotel was such a building as she had never seen, except from the outside; and the furniture, and the waiters, and the chambermaid all rather overwhelmed her untravelled spirit. But she bestowed herself in the

big bed with a combined sense of adventure and luxury, and was fast asleep in a few minutes, and slept indeed until the chambermaid's knock aroused her. She looked neat and pretty in her plain black dress, and spotless cuffs and collars of white linen; but she shrank inwardly to think that only ladies had a right to be in so magnificent a place as this, and reflected with sadness that ladies always went habited in silken gorgiosities, with gold chains and real lace and other marvels about them. She ventured out into the vast hotel corridor, and its waste silence frightened her so much that she retreated, and felt so utterly lonely and deserted, that the tears of last night were almost on flow again, when with a little dictatorial knock the chambermaid entered and said that breakfast was ready. So Mary meekly followed the chambermaid, who led her once more into Val's presence. Let it be recorded to his credit that he had on this occasion surrendered one of his own specially-beloved habits. He disliked crowds and *tables-d'hôte*, and being rich enough to secure privacy wherever he went, had strengthened native tendency by habit, until a public eating-place was hateful to him. Breakfast, in especial, was a meal he liked to lounge over in privacy, in dressing-gown and slippers. But thinking wisely that the girl would rather be spared a *tête-à-tête*, and that her present position—alone, and with a male protector who was a stranger—demanded all possible delicacy of treatment, he ordered breakfast for two in the coffee-room; and thither she was shown. The breakfast service hit the untravelled maiden hard—the cut-glass and the bright electro-plate, and the dish-covers. There were well-dressed people of both sexes in the room, and the room itself was large, lofty, and richly papered and corniced. She sat down in a tremor at all this, and Val had some little trouble in putting her completely at ease. Not that there was any open sign of *gaucherie* or ill-breeding about her—she would have passed for a lady with wonderfully little practice. After breakfast, Val took her to meet the early train; but no Garling came by it, for the best of reasons—or the worst. She told him with childlike *naïveté* all her little story, if you except the fact of Hiram; and Val learned that she had lived all her life with the mother whom she had so lately lost, poor thing, and had worked this last three years as a milliner in the City. She was not at all clear about Garling, but supposed he had been away abroad—vaguely, and had only lately returned.

'And you don't know where he was coming to—in Southampton?' her companion asked.

'No,' she answered falteringly.

'And he doesn't know where to send to you?'

'No,' she said again. Val pondered as they went back from the station together. Was this mere child purposely thrown loose upon the world? Wickedder things than even that were done every day, and it was quite possible.

'Where does your father live?' he asked her. But as this question evidently embarrassed the girl, Val proceeded on another tack.

'Do you know anybody else in London who would take care of you?' he inquired.

'O yes,' she said, brightening a little to think of Hiram. If she could only reach Hiram, she was safe.

'Had you not better send a message and go back?'

'I can't send a message,' she faltered; 'I don't know the address.'

'Can you find the address?' he demanded.

'No,' she answered; 'but I can find *him*. He conducts an omnibus, and it goes up and down Cheapside.'

'Oh!' said Val, with a curious glance at her. 'He conducts an omnibus, does he? And it goes up and down Cheapside? Very well, then. And you are quite sure of being safe, if you find him?'

'O yes,' she cried, with so much certainty, that Val read the whole thing at once.

'Very well,' he responded. 'You had better go back to London. Do you know what to do with your luggage when you get to the station?'—She knew nothing.—'I never met such an unsophisticated little creature in my life before,' he said to himself. He explained to her how to leave her luggage at the cloak-room, and to take a ticket for it; and next he sought out the station-master, and told him where to send any inquirer who might come from London on the outlook for a daughter. To be brief, he saw her away by the next train, Garling still being absent from the scene; and having paid for her ticket, he bestowed her in a carriage, committed her to the care of the guard, and slipped a five-pound note into her hand as the train moved off. His manly kindness to this poor waif of fortune thawed his own numbed heart awhile, and then he went away and forgot her. She never forgot him—it was scarcely possible that she should forget so notable a figure in her small life-history. She was faithful to Hiram; but a wonderful sort of worshipping admiration surrounded the kindly and generous stranger in her thoughts. Faithful to Hiram? Val no more disturbed her faith than if he had been a creature from another sphere, a conventional angel, or some other such wonderful wild-fowl. But she remembered him, alike with gratitude and affection, and eagerly repaid him when the time came. And it was not her fault if the service she rendered him went towards his own undoing; but his, who chose the service for her.

The weather was growing mild, and in the country places, Spring was stealing up apace, working all her yearly miracles by the way. The air grew balmy, and the sky clear. 'What does it matter to me where I go?' said Val desperately. The open sea would somehow be in tune with his mood, he fancied; and so he shipped for the West Indies, after lounging for an uneasy day or two at Southampton; but speeding towards the Islands of Spice over a sea and under a heaven which grew daily more lovely, he found no peace of heart. He wrote before starting one brief letter to Reginald, in which every line breathed recklessness and despair. He had locked Constance's portrait in the largest of his trunks, and had it buried in the ship's hold, without much avail, since it haunted him through the long empty hours of a smooth and uneventful passage. Perhaps this voyage was as mistaken a remedy as he could anyhow have indulged in. He had nothing to do except to smoke and moon about the decks and

think of Constance and his own unhappiness. His fellow-passengers were few and disagreeable. They comprised a Jewish lady who had been handsome, and remembered what had been so clearly, that she had no perception for the present, but dressed and ogled eagerly for Val's delight: a beady-eyed boy of twelve, her son, who had been at school in England, and was, from a combination of causes, downright intolerable: a ponderous British person, who oiled his hair, wore crumpled linen, and much flash jewellery, and spread dirty hands on the dinner-table to have his rings admired: and a couple of British youths fresh from school, who were going out to a sugar estate in Jamaica. These young gentlemen being newly liberated from the restraints of civilisation, drank brandy-and-water all day long, and smoked, by way of announcing the complete attainment of the rights of man, the vilest Cavendish to be got for love or money. The condition of Val's mind was such that these people one and all became hateful to him. They were not nice people, and under any circumstances he would have chosen their room rather than their company; but now they seemed to inspire him with a disgust of all his species. For the first time in his life, he was morose for a week together; and being forced inward, he fed upon his own heart, and found it innutritive and spiritually unpalatable. He was so far gone, that he never once brought himself steadily to contemplate this as a final parting from Constance, and when that view of the journey insisted on being faced, he put it away from him savagely. He was going away—that was enough, surely. He was already absent and in pain; why torture himself needlessly? Slowly but surely, his mind began to slide back to the contemplation of an immediate return. It was clear enough that if he ventured upon such a course, it must be pursued secretly and without Reginald's knowledge; and thus he found himself pledged to crooked courses at every succeeding stage. This journey began to assume the aspect of a penance voluntarily undertaken, and turning out to be unavailing. Val found it anything but easy or pleasant to be a scoundrel; he was so unfortunately susceptible of popular opinion, so anxious to stand well with all men, and to have the good opinion even of strangers. This feeling operated now so decidedly, that even when he had determined to return, he would not go back by the ship in which he had made the outward voyage, lest the captain and the crew should think him an uncertain vacillating fellow who did not know his mind, and was moving vacuously for no purpose about the world. He even made a pretence of business to his servant, whilst awaiting the departure of the next homeward-bound vessel, to conciliate his good opinion. Excuses were not lacking for him, as he steamed homeward. He had gone away, and found it impossible to remain. Perhaps, after all, circumstances might hold him apart from Constance. Perhaps, even—so monstrous a shape could self-delusion take—he might see more of her, and become disillusionised. Val Strange was not a fool by nature, and yet he accepted even this preposterous pretence of an excuse, and persuaded himself that it was probable.

He reached England, and journeyed back to London. But town was growing full, and he was afraid of observation, and avoided his clubs and his old companions. He nevertheless contrived to learn that Constance had returned with her father and brother to the Grange, and moved by some desperate impulse, ran down to Ryde, where his yacht was lying, and sailed for Welbeck Head, in the mad hope that somehow he might get a glimpse of her. Before he sighted the Head, he had been absent from Constance six weeks, and in that time great events had taken place.

ROD AND LINE IN NORTH UIST.

THE picturesque and varied scenery of the steamer's route by Colonsay and Iona, through the intricacies of the Inner Hebrides, goes far to relieve the tedium of a trip to Lochmaddy by the *Dunara Castle*. It is a long journey, even if the shorter passage from Oban be selected; and yet, once landed at the principal port of North Uist, and domesticated in the homely but comfortable inn, built by the proprietor near the steamboat quay, the enthusiastic angler will soon forget the fatigues of his travel in anticipations of the sport which the island undoubtedly affords. The immediate surroundings, on his stepping on shore, may indeed be hardly up to his expectations; for Lochmaddy itself has suffered, in common with other celebrated localities, from having been depicted, in the past, in colours more glowing than truthful by some of its admirers who ought to have known better. If the visitor expects to find on arrival a small but flourishing township at the head of the spacious harbour, he will be disappointed. Although the seat of a sheriff-substitute, it is in nowise like Stornoway; it does not even rival in dimensions the neighbouring Tarbert in Harris; for in sober reality there is very little of Lochmaddy altogether; only about a score of houses, and even these not arranged in the form of a row or street, but each planted at a considerable distance from its neighbour, as if they feared to come into close contact. It is reported that a tourist once, after landing, ascended a neighbouring eminence, to ascertain if the veritable Lochmaddy were not hidden somewhere in the background; but he was disappointed. He had seen all that presently is to be seen; unless, indeed, he possessed the gift of second-sight, and obtained a glimpse of the Lochmaddy of the future, the successful rival of Stornoway and Portree.

Here, however, our angler, if intent on sport, must not make up his mind to linger; for the lochs in the immediate neighbourhood, though numerous enough, will not be found of the best description. It will be better for him at once to make the journey across the breadth of the island to the western shore, and to take up his quarters at or near the village of Tigharry, by road about seventeen miles, where, in default of better lodgings, he will find a very humble hostelry. On this coast, where the great majority of the population reside, and where the ground is more extensively cultivated, the fishing-waters will best repay a visit. It is only after leaving Lochmaddy behind, and striking across country by road, that any idea can be formed of the

enormous water-area of the island. The whole interior is then seen to be intersected in every direction with numberless lochs, and also with long salt-water creeks and inlets penetrating for miles. To a stranger, it appears as if the whole of the low-lying ground had been submerged with some mighty rainfall. The lochs are on every hand and of all sizes, from the merest pools to long silent stretches of water, dappled with fairy islets, and losing themselves in the windings of the hills. The diversified hill-scenery of the centre of North Uist alone preserves the landscape from a dreary monotony, as the whole country is absolutely treeless. How much the general effect is here relieved by the mountain ranges, may be seen by visiting the southern island of Benbecula, where the watery and swampy soil is crowned with the single hill from which the name of the locality is derived. In this latter district the land seems in the winter season to form only a series of bridges over the prevailing water, and much of the interior being considerably under the sea-level, is subject to frequent floods at high tides. Professor Blackie's unpublished lines on Benbecula seem truly appropriate to this melancholy region :

A thrice-forsaken, thrice-deserted land,
Where ducks contest with men the doubtful strand.

But let us return to North Uist, with its less sombre landscape. One disadvantage to the angling stranger of this bewildering extent of loch scenery is that, unless provided with an experienced guide to bring him to the most celebrated fishings, he might spend at anyrate the better part of a whole season in endeavouring to discover them for himself. He would also find from experience that certain chains of lochs are better for sport at one time than at another ; that whole districts, in fact, may be assigned to the early months of the year, and others to the later. The sea-trout streams and waters might also escape his notice altogether. Presuming, however, that he has obtained the indispensable permission to angle from the resident factor to Sir John Orde, he may gain from that gentleman sufficient directions for his start. For the rest, he must trust to his own judgment and skill. Perhaps in these notes he may find some finger-posts for his way.

A very exceptional and favourable characteristic of the lochs in North Uist is that a great number of them can be fished without much difficulty either from the shore, or at the cost of a little wading. Stone dikes, built as cattle-boundaries, have in many places anciently been erected on the banks, and their remains often stretch a considerable distance into the water, forming short and irregular piers, which serve admirably the angler's purpose, and give him command over considerable stretches of surface. This is a matter of no small importance in a place, where boats are not often to be met with on the fresh water. Another desideratum is found in the strikingly irregular nature of the loch-margins, and the numerous natural promontories which abut from the shores.

Perched on a rough seat of stones at the extremity of one of these rocky points, the Hebridean native may often be seen patiently fishing for trout with a rudely-constructed rod,

and a line tied to the point of it. He generally despises the artificial fly with its scientific accompaniments, preferring the indigenous worm, which he never places on the hook without a preliminary incantation of a salivary nature—a custom the origin of which is lost in antiquity. He expects only the smaller trout of these waters to come to the bait ; and generally he is not disappointed. His patience being inexhaustible, he will sit on his cairn from dawn to dusk for the expected basketful. Should he, however, be fishing in a sea-trout loch and at the proper season, his lure may perchance be visited in a most violent manner by some stray monster fresh from the sea, who, with one mad rush, makes short work of the homely tackle. This is no slight misfortune to the native angler, whose whole stock is generally in active service ; so he resignedly departs ; never disappointed at losing 'the big fish'—he never dreamed of securing it—but resolved to seek again another and a quieter scene for his labours. The occasional sea-trout to him is a calamity, unforeseen and unavoidable, which he is thankful to escape from on any terms, and even at considerable sacrifice !

The trout of the island are of three varieties : first, the common black trout of the burns and lochs, generally of average size, but in some waters attaining great weight. These are obtainable from March to October, but are best in the earlier months. Secondly, there are the yellow trout, in some instances forming the only denizens of a loch—notably Balleloch, in Tigharry district ; and in others to be found along with the black trout. They have been caught up to six pounds-weight. Lastly, there are the sea-trout, which ascend three or four short streams in the island, generally about the second week of September, and are sport for rod and line till the end of October. There are no true salmon in North Uist ; but sea-trout are found in the following streams : Loch-na-Ciste, near Lochmaddy ; Horasary and adjoining stream, south of Paible on the west ; Mullanageren, on the north-east, near Solas ; and a fourth, not officially recognised, Arivichrurie, to the north of the last-named. At least one of these is understood to be strictly reserved for the proprietor's personal sport. At any one of them, in a fair season, the finest sport may be obtained, the fish running up to eight and even ten pounds in weight. The streams are very short and narrow, and the best sport is generally obtained in the lochs above.

Taking the western shore of the island—the side from which the magnificent prospect is obtained of the South Uist hills, with Barra to the south, and St Kilda looming in the dimmest north-west distance, with the Heisker Islets in the centre—it will be found that the extent of the road circling the island, between the hamlet of Clachan on the south, and Tigharry, our imaginary headquarters, on the north, some nine miles altogether, lies alongside of the best fishing-lochs in North Uist. As a general rule, the various sheets of water on a level with and below this road on either side will be found the earliest and at the same time the most favourite haunts of the yellow trout. On the grounds rising to the central hill-range, the lochs are larger, but stocked

with smaller trout, and later in the season. In the Paible district, two miles south of Tigharry, the lochs are unexceptionable both on the landward and seaward side of the road. Horasary, the finest of the sea-trout waters, is south of Paible. Loch Mhiran—the names are all Gaelic—an insignificant sheet of water in this district, affords magnificent yellow trout of four to six pounds-weight, although the fish are shy on account of the great clearness of the water.

In Balleloch, near Tigharry, we have enjoyed many days fine sport through the courtesy of the parish minister, who rents the fishing in it and keeps a boat for angling. From these lower waters the angler can find his way by numerous peat-roads striking inland, to the hill-lochs proper, generally edged with peat-moss, and filled with inferior fish. The more remote lochs again, in the centre of the island, within the hill-ranges, are, generally speaking, worthy of only a stray visit. The difficulty of tracing their interminable windings, and the uncertainty of good sport in them, contribute to this. The very largest sheets of water it is not worth while to attempt, unless with a boat; they are as a rule teeming with fish, but of small size; while, on the other hand, and more especially is this true of the seaward lochs on the west side, the most uninviting and shallow pieces of water, if reed-fringed and weedy, often contain large and fine fish. Numbers of these lakelets can be waded from side to side waist-high. In a shallow, marshy loch close to Paible Free Church, the writer has frequently landed yellow trout of large size and surpassing quality.

As to the merits of particular lochs, which it is impossible here to enumerate even by name, a good deal of information can generally be obtained from the people of the district. Allowance must be made, however, for the hyperbolical Gaelic. In many instances also, an unfortunate desire 'to please the Sassenach' with a favourable report is mixed up with a regard to strict truthfulness; and in the case of the older inhabitants, information is often derived from hearsay or from experience considerably out of date. We remember trusting on one occasion to the testimony of an aged individual of unquestioned integrity, regarding the merits of a far inland loch, of which he spoke in the highest terms. It was, we were told, difficult of access—about thirteen miles stiff moor and hill travelling on foot; but the sport reported was so tempting, that we determined to essay the journey, with the help of a rough sketch of the intricate loch-windings, with which our adviser furnished us. Our start was a very early one, on a May morning; and he accompanied us a short distance on the way. We were cautioned that we would find only an insignificant loch in appearance, but the fish were said to be the largest in the island. The last time our guide had fished it, his basket was almost too weighty to carry. 'How long may it be,' we hesitatingly inquired, 'since you were last there?' 'Just the year,' he replied, 'before the Disruption! It was admirable then!' It was too late to retreat. In the evening twilight, three limping figures, with a thoroughly worn-out and dispirited dog, found their way home. We had discovered the loch indeed; and the result of a day's labours in its waters—untroubled, we suppose, since the

date of the great ecclesiastical controversy of 1843—was a solitary and sable trout of some six pounds with a gaunt and pike-like head. We vaguely associated him with 'The Ten Years' Conflict' and the 'survival of the fittest.'

The Gaelic proverb has it that the dryshod fisherman has but an empty basket, a sufficient warning to dilettanti anglers not to attempt Hebridean sport. It is a very different thing from fishing in a punt on the Thames at Richmond. Perhaps the most bracing and exciting variety of it may be found in September just before the sea-trout ascend to the fresh water. For days and even weeks beforehand they have been lying in large salt-water pools on the sea-shore, left by the tide at low water, waiting for a 'spate' of rain to enable them to ascend the streams with safety. Some of these pools inside of the outlying island of Kirkibost are of great extent and depth; but owing to the transparency of the water, they are only to be fished with profit when ruffled by a strong wind. Under these conditions, when loch-fishing is impracticable owing to stormy weather, the sea-pools may be attempted with good results. The fish are of course fresh from the sea, or rather not yet out of it, and are in first-class condition and very game. Anything more exhilarating than this fishing on the windy shore, in the purple depths of an unfathomed pool, can hardly be conceived.

A word as to the angler's outfit for these regions. It should include at least two rods, one of grilse size with more than the usual complement of top joints. The writer has invariably used the fine hemp lines. A pair of wading trousers, &c., is essential. The most useful flies will be found in the smaller loch varieties, with the *roughest* dressing obtainable, and preferably silver tinselled for the smaller trout; the larger sizes of drake, speckled teal, and dun wings, with scarlet, blue, and yellow bodies for the yellow trout, along with a selection of dragon-flies, grubs, and creepers. For the sea-trout sport in September, the most killing fly, without exception, will be found in the red-hackled spider dressed with scarlet and gold. Other flies may be used, including black palmer with silver, but the above is *the fly par excellence*. It has generally been found advisable on the sea-trout lochs of this island to fish with two or even three flies on the cast, instead of the customary single one. One thing regarding all flies used in this locality is noticeable, that the more bristling and hairy the dressing the more attractive the lure; and, as another generalisation, the hooks may be a shade smaller than those in common use elsewhere for the same size of fish.

OUR FRENCH PROFESSOR.

CHAPTER III.—CONCLUSION.

I LEFT Wimbourne Hall without bidding Emily farewell, as she was away on a visit. De Montgrais wished me *bon voyage* with apparent cordiality, and Dr Walters begged me to make use of any influence he had to further my career. So, the dream was over; and Emily White was to be only a bright agony haunting me for the rest of my life. I did not know that she cared for me more than for others equally far from her path

through the world. A look, a little sigh, a kind hand-grasp, may mean anything or nothing. One thing was now clear to me—that we should be henceforth strangers, our fates as uncommingled as though we had lived in long-divided epochs of time. Work must fill up my existence now; ambition, and not love, be my guiding-star.

On reaching home, I put away my violin out of sight, and I buried myself in the hardest problems of logic and mathematics. I would go in for the highest prizes of academic fame, and let Dr Walters hear of me by brilliant reports of success in the newspapers. For about a fortnight I acted up to my resolution with Spartan fortitude, and then there came a flood of events, which swept me into other and very different channels of activity.

First was a letter from my friend the medical student at Paris, explaining the cause of his long delay in replying to my communication, he having been on a cruise to Alexandria on board a French gunboat. Since his return to Paris, he had been to the Prefecture of Police; but had heard nothing, official reserve forbidding any information. He interpreted this to mean that De Montgris was unknown to the guardians of public safety. As I had terminated all connection with Wimbourne Hall and its inmates, I was rather glad that my inquiry had ended in nothing.

Three days after the arrival of my friend's letter, a gentleman called upon me, who was plainly a Frenchman, though he spoke English almost as well as myself. He put a number of oblique questions to me respecting Dr Walters, the school, and its inmates. I answered them; and then very bluntly began to ask what was the purpose of the interview. He looked at me keenly, as only a wary policeman can; then, with a half-smile, explained his errand. He had been sent from Paris to make inquiries respecting a certain M. De Montgris, and was acting under instructions from the Consul.

The upshot was that I had a long interview with certain French and English officials. The same evening I started for Wimbourne Hall with two companions. We spent the night at the village hotel; and after breakfast next morning, I went alone to the Hall to make inquiries. The family, I was told, had gone to a garden-party a few miles away, and were not expected home until late.

Mrs Elphinstone was fond of talking, and poured out a copious stream of domestic trifles in response to my interrogatories. Miss White was not so well; but naturally, a young lady in her position must feel a little anxious.

'What do you mean, Mrs Elphinstone?' I demanded with some alarm.

'Why, you know, it is a trying thing to go to live with strangers, however much you may like them afterwards. Not but she ought to be proud after all.'

'Do explain, Mrs Elphinstone,' I cried impatiently.

She rebuked me with a dignified wave of her

fat hand, for she liked to keep undermasters at their proper distance. Then, solemnly: 'Miss White is going to be married, and be made a Markis.'

'A what?'

'A Markis,' she said again, with marked emphasis.

'But who is he?' I asked.

'Why, Monsieur De Montgris, to be sure. He is a Markis too.'

Although I had a certain assurance that such would be Mrs Elphinstone's reply, it nevertheless staggered me.

The good housekeeper believing me reduced to a fitting state of respectful attention, went on: 'Ah! Miss Emily will be a grand lady soon, for Monsieur is going to get back all his estates. He told me so himself. What a real gentleman he is! so polite, and so clever. If I was Miss Emily I should dote on him; and he ought to be proud of her too. She is a good and kind young lady, and not without money of her own. If it had not been for her, Monsieur might have had to wait many a year for his property and rights.'

'What has she done?' I asked, struck by these latter remarks.

'A part of her fortune will help Monsieur to pay the lawyers that have been such rogues to the poor gentleman. At least, so I hear. Of course I don't know everything.'

'Where is Monsieur De Montgris now?'

'Why, at the garden-party with Miss Emily. Where else should he be?'

At this time a servant came in to say that a foreign man was at the door asking for M. De Montgris. I thought it was one of my companions, and followed the servant. But I was in error. I found a strange, shabby, disconcerted-looking man, who seemed to have gone through much recent hardship.

Mrs Elphinstone asked what he wanted; and in almost unintelligible English, he said he wanted M. De Montgris. Nothing else could be got out of him. At length I spoke to him in French, which startled him, and at first increased his reserve. Then he began to talk about the importance of his visit to De Montgris. In fact, he must see him, and at once.

There was something so singular in the man's looks and behaviour, that I did not hesitate to direct Mrs Elphinstone to show him into a room and offer him some refreshment, as a friend of De Montgris. He seemed ready to drop with exhaustion and anxiety.

But the housekeeper had a prejudice against all shabbily dressed people, and refused to offer any hospitality unless I would sit in the room with the man. He might be a dangerous impostor, and there were only a few women about the Hall.

So I went with him into the still-room, where he was soon supplied with some cold meat and bread. He fell on the food like a wolf, tearing the meat with his fingers. In five minutes he had cleared the table. One thing surprised me—he kept his hat on, a quite unusual thing for a Frenchman when invited indoors. It was a burning August morning, and the sun was pouring into the room. The meal had made him perspire; but he kept his battered old wide-awake tight over his brows.

'Will you not take off your hat?' I said, annoyed at his rudeness.

He cast a quick uneasy glance at me, hesitated a moment; then pulled his hair over his forehead, smoothing it with his hand, and finally placed his cap in his pocket.

I thought him an odd fellow; but as I wished to know something of the reason that had brought him to Wimbourne Hall, I put on the most indifferent look, and drew a travelling flask from my pocket, thinking a dose of brandy might lessen his reserve. It did. He was not long in emptying it. I gave him a cigar, which he smoked with extraordinary zest. Indeed, this evidently gave him more pleasure than anything he had before received. The hard, distressed haggardness began to pass from his face, as he inhaled the tobacco rather than smoked it. Soon we were chattering familiarly about the general superiority of France to England. All at once the man stopped the current of patriotic admiration, saying with bitterness: 'All Frenchmen are egoists—each for himself. There is no fidelity, no friendship amongst us.' He grew excited, and struck the table a savage blow, as though he were hitting an enemy. Then he turned hastily towards me, which made his cap fall out of his pocket. He picked it up. In stooping, the lank hair parted on his brow, and I saw that it was marked with a curious red patch, a sort of birth-stain.

'Is Monsieur De Montgris an egoist?' I said with a cynical smile.

The man jumped up as though I had insulted him. 'Egoist! Look you, that De Montgris, as he is called, is selfishness incarnate. He has driven me mad with anxiety and misery. But I will be quits with him just now. I will starve no more alone.' Then recollecting himself, he sat down as suddenly as he had risen, and fixed his eyes moodily upon the floor. He refused to talk further, saying that he was worn out with fatigue, and must sleep for a little while. The food and drink were beginning to have their usual effects upon an exhausted and hungered man. It was impossible to leave him in the house after my departure, and yet I wanted him to remain until I had communicated with those waiting for me at the village inn. I therefore took him to the stable, and bid him lie down in an empty stall, promising him that De Montgris should come to him as soon as he returned.

An hour afterwards, one of my companions was coolly surveying the sleeping vagrant, who lay as still as a man under the influence of a powerful opiate. His lank, grisly hair had fallen aside, and exposed his forehead to the light. I shall never forget the sight of that brow, grotesquely dabbled with purple stains.

'It is *Peau-rouge*,' said the French police agent, quietly locking the stable-door. 'We are more than fortunate.'

I never passed through such a feverish time as the hours which intervened between mid-day and dusk, when Dr Walters, Emily, and De Montgris returned.

The Doctor came to the library, where I awaited him with an official from the Home Office. He was surprised at the seriousness of my greeting.

'I am here on a painful and embarrassing errand, Doctor. It is about Monsieur De Montgris.'

'What do you mean, sir?' he said haughtily, 'Monsieur De Montgris is a gentleman of the highest respectability, and I refuse to hear anything said of him, unless he is present'—

'He will have the fullest opportunity to refute all that is alleged against him, Dr Walters,' interposed the official, stepping forward; 'but it is your duty to hear me first.'

'Who are you, sir?' demanded the Doctor with pompous anger.

'One of Her Majesty's servants. My business is to arrest the person called De Montgris, alias Barbier.'

'How dare you say such impertinence to me?' cried the Doctor with incredulous disdain. 'You are labouring under a most absurd mistake.—Mr Bevan,' turning to me, 'your conduct is infamous!'

I would have made a sharp rejoinder; but the official put me aside, saying: 'Dr Walters, I must ask you to limit this interview to its proper purport. Here is my warrant for the apprehension of this man.'

The Doctor read it, then flung it down with supreme contempt. 'I must have better evidence than this before I permit the hospitality of my house to be violated, even in the name of the Queen. I have the amplest proofs of Monsieur De Montgris' integrity and social position. He is a nobleman, and will soon come into possession of one of the finest properties in Normandy. You really are most absurdly deceived.'

'I repeat, Dr Walters, that this so-called De Montgris is named Barbier, an escaped convict from Toulon, one of the most daring and able of the desperadoes of France.'

The Doctor waved his hand impatiently, and smiled at the official with lofty scorn. 'I have what you cannot confute by all the accusations in the world,' he said. 'I have the title-deeds of Monsieur De Montgris' estates locked up in that safe;' pointing to a corner of the room.

'Will you allow me to see them?' asked the official.

The Doctor hastily opened the safe, and laid a bundle of parchments and papers upon the table, saying with sneering exultation: 'I hope this will end the farce.'

For several minutes the official looked over the documents, then folded them into a neat packet and placed them in his breast-pocket. 'This completes my case, Dr Walters. These papers were stolen by Barbier from the real Monsieur De Montgris.'

It was a heavy blow. The Doctor sank under it. 'Give me particulars of this terrible affair,' he said faintly.

'The man Barbier,' replied my companion, taking a seat near the Doctor, 'is the son of a respectable merchant at Rouen. He was educated in England and at Strassburg, being intended for commerce. That accounts for his knowledge of English and German. He was a wild youth, a reckless young man; and after plundering and disgracing his father, fell into the society of the cosmopolitan scoundrels that haunt the capitals of Europe. He has been a professional gambler in half-a-dozen cities; and is believed to have killed a man at Homburg, who beat him for cheating at cards. After this he wandered about as a circus rider and acrobat. He has been a

conjurer at fairs in Holland and Belgium. But his most daring exploits have been displayed in forgery. It was for defrauding the Bank of France that he was sent to Toulon. After two years, he escaped with a man called *Peau-rouge*. They reached Africa, and dwelt with the Arabs for some time. A year ago they came to England, and have given proof of undiminished rascality to many victims. Barbier met a certain Monsieur De Montgris in London, who was going to Beyrout. He passed himself off as an Arab merchant in search of a partner to open out a new path of trade in Syria and Africa. He won the entire confidence of De Montgris, sent him off on a fool's errand to Cairo, and then decamped with all he could lay his hands on. By a forged letter he got possession of these deeds from the notary employed by M. De Montgris, hoping to get a mortgage upon the property they represent. But suspicions were aroused, and he had to hide himself. He has done so in your house; and in his guise of Professor has, I have no doubt, deceived you as completely as he has deceived scores of others.'

The poor old Doctor listened to the end like a child to a tale of fascinating horror. When all was told, he leaned his head upon his hands. But he was soon roused by the noise of hurrying foot-steps and a convulsive scream. Miss White rushed into the room, looked wildly at me and my companion, then threw herself into her uncle's arms. She was followed by two village policemen, one holding Barbier with an iron grip, and the other the man whose sobriquet was *Peau-rouge*. The French policeman followed.

I need not go into the details of the *dénouement*—how Barbier and his companion were returned to the French authorities, after a series of examinations before the English magistrates. Fortunately, Miss White's small property was not injured by the crafty devices of Barbier. Dr Walters felt the shock so acutely, that for many months he was quite unable to attend to the duties of the school. At his earnest request, I resumed my old position; and during his illness and absence, I acted as Vice-principal of Wimbourne Hall.

Three years after the events recorded in this little story, I was inducted proprietor of the school, and made the lifelong guardian of Emily.

MISAPPLIED VIRTUES.

SHAKESPEARE tells us that 'virtue itself turns vice, being misapplied.' From this text we would draw attention to the often-forgotten fact, that the best and most beautiful points of character may develop into monstrosities, if cultivated without pruning, or in the absence of counterbalancing qualities. A man cannot be too virtuous; but there may be a want of proportion between the good qualities of his mind and heart. How few have well-balanced minds—how few have their feelings under proper control. What is a good temper but a mixture of qualities in due proportion? Where this due proportion is wanting, the temper and disposition become perverted and bad. Almost all vices are the exaggeration of virtues—'virtues misapplied.'

As an illustration of this principle, let us take

that faculty by which we conceive and long after perfection, and see how even such a beautiful quality as Ideality may, if too exclusively cultivated, drag down rather than elevate its possessor. This divine Ideality, more than anything else, distinguishes man's nature from that of the brute. From it springs the dissatisfaction with present attainments, possessions, and performances, which induces us to strain after higher ones. To make us dissatisfied with the actual, and to spur us on continually after something for ever desirable, yet for ever receding—this is the office of Ideality. But every faculty has its instinctive, wild growth, which, like the spontaneous produce of the earth, is crude and weedy. Revenge, says Bacon, is a sort of wild justice; obstinacy is untutored firmness, and so exactingness is untrained Ideality; and a very great amount of misery, social and domestic, comes not of the faculty, but of its untrained exercise. The faculty which is ever conceiving, and desiring something better and more perfect, must be modified in its action by good sense, patience, and conscience, otherwise it induces a morbid, discontented spirit, which courses through the veins of individual and family life like a subtle poison.

An exacting person is one who fusses, fumes, finds fault, and scolds, because everything is not perfect in an imperfect world. Much more happy and good is he whose conceptions and desire of excellence are equally strong, but in whom there is a greater amount of discriminating common-sense. A sensible man does not make himself unhappy because he is unable to fly like a bird or swim like a fish. Common-sense teaches him that these accomplishments are so utterly unattainable, that they should not be desired.

Most people can see what is faulty in themselves and their surroundings; but while the dreamer frets and wears himself out over the unattainable, the happy, practical man is satisfied with what *can* be attained. There was much wisdom in the answer given by the Principal of a large public institution, when complimented on his habitual cheerfulness amid a diversity of cares—'I've made up my mind,' he said, 'to be satisfied, when things are done *half* as well as I would have them.'

Ideality often becomes an insidious mental and moral disease, acting all the more subtly from its alliance with what is noblest in us. Shall we not aspire to be perfect? Shall we be content with low standards in anything? To these inquiries there seems to be but one answer; yet the individual driven forward in blind, unreasoning aspiration, becomes wearied, bewildered, discontented, restless, fretful, and miserable. And being miserable himself, he is almost certain to make others unhappy. This is the secret reason why many pure, good, conscientious persons are only a source of uneasiness to those with whom they come in contact. They are exacting, discontented, unhappy; and spread discontent and

unhappiness around them. These are people who make no allowances either for themselves or others, but are equally angry and resentful towards both, and for this reason, that the great virtue of being dissatisfied with imperfection has turned into a vice, being misapplied.

Blind persistence in trifles, which is a deformed shoot from a very good stock, will furnish one other illustration of the misapplication of virtue. Like many others, this fault is the overaction of a necessary and praiseworthy quality. Without firmness, all human plans would be unstable as water. A poor woman being asked how it was that her son, after going on steadily for a considerable time, became at last changed in character, replied: 'I suppose because he had not the gift of continuance.' This perseverance of will, or 'gift of continuance,' is found in greater or less degree in every well-constituted nature. It is seen in the lower animals. The force by which a bulldog holds on to an antagonist, the persistence with which a mule will set himself to resist blows and menaces, are pertinent examples of the animal phase of a property which exists in human beings, and forms the foundation for that perseverance which carries on all the great and noble enterprises of life.

But there is a wild, uncultured growth of this faculty, the instinctive action of firmness uncontrolled by reason or conscience, which does much mischief, and causes no inconsiderable amount of misery. Speaking of this fault, Mrs Beecher Stowe imagines the case of two young people in the midst of that happy bustle which attends the formation of a first home. Hero and Leander have written each other a letter every day for two years, beginning with 'My dearest,' and ending with 'Your own,' &c.; they have sent each other flowers and rings and locks of hair; they have worn each other's portraits; they are convinced that never was there such sympathy of souls, such coincidence of opinion, such a reasonable foundation for mutual esteem. They do sincerely respect and love each other; nevertheless, the first year of their married life will be a continued battle about trifles, if both of them are set on having their way at all times. For example, this morning, Hero and Leander are presiding at the arrangement of the furniture which has just been sent to their pretty cottage.

'Put the piano in the bow-window,' says the lady.

'No; not in the bow-window,' says the gentleman.

'Why, my dear, of course it must go in the bow-window. How awkward it would look anywhere else! I have always seen pianos in bow-windows.'

'My love, you would not think of spoiling that beautiful prospect from the bow-window, by blocking it up with a piano. The proper place is just here in the corner of the room.'

'My dear, it would look dreadful there; and spoil the appearance of the room.'

'Well, for my part, my love, I think the appearance of the room would be spoiled if you filled up the bow-window. Think what a lovely place that would be to sit in!'

'Just as if we couldn't sit there behind the piano, if we wanted to! I insist upon it, it ought to stand in the bow-window.'

'Well, I don't think you ought to insist on an arrangement that really is disagreeable to me.'

And now Hero's cheeks flush, and the spirit burns within. But we need not quote all her foolish sayings, or those of Leander, as round and round they go, stating and restating their arguments, both getting more and more nervous and combative, as the animal instinct of self-will grows stronger and stronger.

Alas! how light a cause may move
Dissension between hearts that love,

when the noble quality of firmness is in this way misapplied.

We might mention innumerable instances of the misapplication of virtues. There cannot be a higher quality than Conscientiousness, yet even this may degenerate into censoriousness or hopeless self-condemnation. It was the constant prayer of the great and good Bishop Butler that he might be saved from what he called 'scrupulosity.' Veneration may become bigotry; and if a man be blindly reverential, he will probably sink to degrading superstition. Where there is a deficiency in Combativeness, there is little energy and force of character; but the excess of this quality makes a person fault-finding and contentious.

In two ways, good qualities become warped from their original purpose. Our faculties are 'like sweet bells jangled out of tune,' when any one faculty is allowed to make its voice heard above that of the rest; or when, not being too loud itself, a discord is created, because the opposite faculty, that should harmonise it, has been silenced. Every faculty may become diseased. Insanity is more or less partial. Firmness requires to be kept in check by Benevolence.

Self-esteem gives dignity and independence to the character, but it must be harmonised by Humility. Cautiousness and Prudence, if allowed to become morbid, may almost unfit a man for action.

If, then, we are endeavouring to cultivate ourselves and others, we must see that no one faculty, however good in itself, is developed unduly, or without equal care being bestowed on the growth of a counterbalancing faculty. That only is a true system of education which aims at the development, not of some, but of all the powers of man. In a well-balanced pair of scales, a feather on one side is found to turn the scale just as really as if a ton had been put into it. In the same way, if a man be deficient in one element, a fair development of the opposite quality will show an excess. Some men are exceedingly good; but being deficient in force and energy of character, they produce upon society very little influence. They are like lemonade with the lemon left out, altogether too sweet and insipid. Some, again, have a predominance of animal propensity, and their tendency of character is toward animal indulgences. Others have moral power, with too little intelligence to guide it. Others are warped and unbalanced by a predominance of social feeling. If they had enough of something else to balance their social sympathies, while people would admire them as the 'best fellows in the world,' they would not be obliged to regret in their behalf a course of dissipation and folly. Thus it is that even the

most admired virtues become vicious, unless they are directed in their exercise by that 'sweet reasonableness' which 'turns to scorn the falsehood of extremes.'

SUDDEN WHITE HAIR.

WITH so many professors of the art of rejuvenation proclaiming their readiness to turn old faces into new ones, smooth out wrinkles, obliterate crow's-feet, and restore the hair to its original abundance and colour, the putting of young heads upon old shoulders should be easy enough; but the proverbial impossibility of putting old heads upon young shoulders still seems to hold, although the feat has sometimes been accomplished by Nature herself. Sorrow, not Time, frosted the bright tresses of Mary Stuart and Marie-Antoinette; and theirs were not the only queenly heads that have been prematurely whitened by care and anxiety. While Hanover was waging an unequal contest with Prussia, a lady in attendance upon the consort of the brave blind king, wrote thus of her royal mistress: 'In the last two months, her hair has grown quite gray, I may say white. Four months since, one could scarcely discern a gray hair; now I can hardly see a dark one.'

A similar change has often taken place in the course of a single night. One of the witnesses in the Tichborne case deposed that the night after hearing of his father's death, he dreamed he saw him killed before his eyes, and found on awaking that his hair had turned quite white. An old man with snow-white hair said to Dr Moreau: 'My hair was as white as you see it now, long before I had grown old. Grief and despair at the loss of a tenderly-loved wife whitened my locks in a single night when I was not thirty years of age. Judge, then, of the force of my sufferings.' His white hairs brought no such recompense with them, as happened in the instance of the gay gallant who had the hardihood to hold a love-tryst in the palace grounds of the king of Spain. Betrayed by the barking of an unsympathetic hound, the telling of the old, old story was interrupted by the appearance of the king's guard. The scared damsel was allowed to depart unchallenged; but her lover was held captive, to answer his offence. Love-making under the shadow of the royal palace was a capital crime; and so overwhelmed with horror at the idea of losing his head for following the promptings of his heart was the rash wooer, that before the sun rose, his hair had turned quite gray. This being told King Ferdinand, he pardoned the offender, thinking he was sufficiently punished.

When the Emperor Leopold was about to make his grand entry into Vienna, the old sexton of St Joseph's Cathedral was much troubled in his mind. Upon such occasions it had been his custom to take his stand on the pinnacle of the tower and wave a flag as the imperial pageant passed by; but he felt that age had so weakened his nerve that he dared not again attempt the perilous performance. After thinking the matter over, he came to the conclusion that he must find a substitute; and knowing his pretty daughter had plenty of stalwart suitors, the old fellow publicly announced that the man who could take

his place successfully should be his son-in-law. To his intense disgust, the offer was at once accepted by Gabriel Petersheim, his special aversion, and the special favourite of the girl, who saw not with her father's eyes. On the appointed day, Vienna opened its gates to the new-made Emperor; but it was evening, or near upon evening, when the young flag-bearer welcomed the procession from St Joseph's Tower. His task performed, Gabriel would have descended from the airy height, but found his way barred. Two wretches had done the treacherous sexton's bidding, and closed the trap-door of the upper stairway, leaving the brave youth to choose between precipitating himself on the pavement below, or clinging the cold night through to the slender spire, with but ten inches of foothold. He chose possible life to certain death; but when rescue came with the morning, his eyes were sunken and dim, his cheeks yellow and wrinkled, his curly locks as white as snow. Gabriel Petersheim had won his bride at a fearful cost.

Believing a fortune might be easily won in the oil-country, a young Bostonian went there to enrich himself. One stormy night, a glare in the sky told him that an oil-tank was on fire a few miles off; and knowing that after a time, the oil would boil up and flow over the side of the tank, he made for a hill to witness the spectacle. 'She's coming!' a man shouted. There was a rumbling sound, and then the burning oil shot up from the tank, boiled over its sides, and floated down the creek, destroying everything in its way, and setting fire to a second tank. Curiosity getting the better of discretion, he ran to the ground in the rear of the tanks, to get a better view, and in trying to avoid a pool of burning oil, fell into a mudhole, and stuck fast therein. Struggling till he could struggle no longer, he lay back exhausted, watching the billows of smoke surging upwards and floating away into space. Suddenly his ears were startled by the sound of cannon-firing; a column of flame and smoke shot up from one of the tanks, and he was stricken almost senseless with the knowledge that the 'pipe-line men' were cannonading the first tank, to draw off the oil, and so prevent another overflow. He tried to shout, but the words would not come. A little stream of burning oil ran slowly but surely towards him. He watched it creeping on until it was almost upon him; then in a moment all was dark. When he came back to consciousness, he found himself in his own room, surrounded by 'the boys,' who had seen him just in time to save him. It was a weary while before he was himself again, and then he was inclined to doubt if he was himself, for his once dark hair was perfectly white.

Instances have not been wanting of the hair being deprived of its colour in a few minutes. The home-coming of the king of Naples after the Congress of Laybach was celebrated with much public rejoicing. To do the occasion honour, the manager of the San Carlo Theatre produced a grand mythological pageant, in which an afterwards well-known opera-singer made his debut in the character of Jupiter. The stage-thunder rolled, the stage-lightning flashed, as the Olympian monarch descended on his cloud-supported throne. Suddenly, screams of horror rang through

the house; the queen fainted, and all was uproar and consternation, until the voice of the king was heard above the din, crying: 'If any one shouts or screams again, I'll have that person shot!' Something had gone wrong with the machinery before the clouds had descended ten feet, and Jupiter had fallen through. Fortunately, a strong iron wire or rope caught him cloak, and uncoiling with his weight, let him down by degrees. But a workman falling with him was impaled upon a strong iron spike supporting the scenery. In ten minutes or so they reached the ground, the workman dead, the singer dazed, but able to thank heaven on his knees for his escape; and then the awe-stricken people saw that the black-haired deity had become transformed into a white-haired mortal, whose youthful features formed a strange contrast to their venerable-looking crown.

Staff-surgeon Parry, while serving in India during the Mutiny, saw a strange sight. Among the prisoners taken in a skirmish at Chamda was a sepoy of the Bengal army. He was brought before the authorities, and put to the question. Fully alive to his position, the Bengalee stood almost stupefied with fear, trembling greatly, with horror and despair plainly depicted on his countenance. While the examination was proceeding, the bystanders were startled by the sergeant in charge of the prisoner exclaiming: 'He is turning gray!' All eyes were turned on the unfortunate man, watching with wondering interest the change coming upon his splendid glossy jet-black locks. In half an hour they were of a uniform grayish hue.

Some years ago, a young lady who was anxiously awaiting the coming of her husband-elect, received a letter conveying the sad tidings of his shipwreck and death. She instantly fell to the ground insensible, and so remained for five hours. On the following morning, her sister saw that her hair, which had been previously of a rich brown colour, had become as white as a cambric handkerchief, her eyebrows and eyelashes retaining their natural colour. After a while the whitened hair fell off, and was succeeded by a new growth of gray. This case coming under the observation of Dr Erasmus Wilson, shattered his unbelief in the possibility of the sudden conversion of the hair from a dark colour to snow-white. No man knows more about the hair than Dr Wilson; but he is at a loss to explain the phenomenon quite to his own satisfaction. 'If,' says he, 'it be established that the hair is susceptible of permeation by fluids derived from the blood—a transmission of fluids from the blood-vessels of the skin into the substance of the hair really occurs, the quantity and nature being modified by the peculiarity of constitution or state of health of the individual—it follows that such fluids, being altered in their chemical qualities, may possess the power of impressing new conditions on the structure into which they enter. Thus, if they contain an excess of salts of lime, they may deposit salts of lime in the tissue of the hair, and so produce a change in its appearance from dark to gray.' Then he tells us: 'The phenomena may be the result of electrical action; it may be the consequence of a chemical alteration wrought in the very blood itself, or it may be a conversion for which the tissue of the hair is

chiefly responsible.' So many 'may-bes' from such an authority prove that the mystery of the sudden whitening of the hair is yet unsolved. It is likely to remain unsolved, since the Doctor—more modest than many of his brethren—owns that 'the mysteries of vital chemistry are unknown to man.'

The whitening of the hair wrought by mental disturbance is sometimes only of a partial nature. Vexation of spirit gave Henry of Navarre a party-coloured moustache. An old writer tells of an Irish captain going to deliver himself up to Lord Broghill, the commander of the English forces, who, being met on his way by a party of English soldiers, was made prisoner, and was so apprehensive of being put to death before Lord Broghill could interfere in his behalf, that the anxiety of his mind turned some of his locks quite white, while the others remained of their original reddish hue. Perhaps the curious change was less annoying to its victim than that which befell an American girl, whose first intimation of her lover's falsity was the reading an account of his marriage in a newspaper. After a night's brooding over the traitor's perfidy, her looking-glass showed her that one side of her head was still adorned with tresses of golden brown; but the other, alas! was decked with locks more befitting a grandam than a maiden still in her teens; though even this was not so bad as was the case of a French girl, who, frightened by the floor of her room giving way beneath her, shed her hair so quickly that in three days' time she was—to use the expressive comparison of a chronicler of the event—'as bald as a bell-handle.'

THE OLDEST INHABITANT.

A VILLAGE SKETCH.

'NEIGHBOUR FROST' was the oldest inhabitant of Wenlow. There was no doubt about it. The parish register attested the fact, and the whole village recognised its truth, and respected her accordingly. A woman who was capable of attaining the patriarchal age of ninety-eight, had displayed energy and powers of endurance worthy of the veneration of the neighbourhood. She was petted by the parson and his wife; triumphantly quoted by the doctor as an incontestable proof of the salubrity of the locality and the prevailing longevity of its inhabitants; proudly exhibited to admiring visitors as one of the curiosities of the place; and much cherished by her relatives, as a valuable help from a pecuniary point of view, besides conferring distinction upon the family. Many a shilling and half-crown were dropped into her withered palm, as a token of admiration of her brave defiance of 'the King of Terrors.' Although her brown face was puckered into as many wrinkles as a withered apple, her small, dark eyes had a shrewd twinkle; and her little, bent form had not utterly lost all trace of the sturdy vigour which had helped her through so many years of toil and privation. Her memory, too, still served to recall many quaint, old-world histories, and perhaps a few forgotten scandals concerning folks who had long since 'gone over to

the majority' in the quiet churchyard. Altogether, she was, as her fellow-villagers said, 'a wonder.' She led a life of luxurious ease, in a comfortably-padded easy-chair, in the warmest corner of the fireside of her eldest grandson; made much of by her numerous descendants, amongst whom she was familiarly known as 'the owd crittur,' to distinguish her from another grandmother who had only attained the trifling age of seventy-seven.

Although there was a fair sprinkling of old people in Wenlow and the adjacent villages, there were but two or three tottering on the verge of ninety, and none beyond that; therefore, to 'Neighbour Frost' belonged the proud privilege of having passed all in the race with Time, and nearly wrested a century from his niggardly grasp. It was a grand pre-eminence, and much gloried in by the ancient dame herself. It was her *specialité*, the crown which no one could take away from her. In respect of age she was unrivalled in the neighbourhood. Her name might be handed down to posterity, and obtain honourable mention with Methuselah and Old Parr, or with the evergreen Countess of Desmond.

Suddenly, however, this blissful dream was rudely and cruelly disturbed. A great-grandson rushed home from school one morning with the appalling news that a 'very owd woman, owder than Grannie, wor just come to Wenlow.—You can see her, Grannie, if you look out. She's Master Simpson's mother; and they're a-lifting of her out o' the cart agin his house. They say she's close on a hunderd.'

'What!' shrieked poor old Mrs Frost; 'John Simpson's mother come here! I thowt she'd been dead years agone. What did they bring the owd crone here for? I niver liked her.'

'Well,' observed the boy's mother, who had just come in from a gossip, 'she's been living with a daughter who's just dead; and as she was born here, Simpson's people thowt the owd gal might as well end her days here.'

'And a rare article she looks!' disdainfully snorted old Mrs Frost, who had been watching her rival's laborious descent from the cart to the ground.

Dame Simpson certainly was not in such good preservation as our venerable friend. She looked painfully old, 'with the fardel of her years overprest,' withered and fleshless—a mere little bundle of bones; with lack-lustre eyes, which seemed to look dimly at you through the haze of vanished years; and with a feeble, piping voice, that seemed to have been long ago left behind also. However, she was old, very old, and a genuine production of the parish.

On looking into its records, it was discovered that she was just a year older than 'Neighbour Frost.' Having left her native place early in life, her existence had been forgotten by all but her immediate relatives; but now every one seemed anxious to make amends for previous negligence; and many a mortification did the Frost family endure in seeing the fickle public lavishing its attention upon the new-comer as the greatest curiosity. The presents of tea, eggs, dainty little puddings, or 'a few broth,' which used to be old Mrs Frost's peculiar perquisites, and the visits from 'the gentry,' were now divided with the

interloper. 'Worst of all,' said Mrs Frost, 'Miss Alice, the parson's daughter, went and drew a pictur of the poor, toothless, owd crittur; and the parson, he went to talk to her; but she wor wholly *waffled*, and could only tell him she wor tired out, and longed to be laid to rest; and then Nurse Simpson says in her carnying, fawning way, "'Tis only the beautiful soup and wine and sich as you kindly send, sir, as keeps her from sinkin'; but I trust we shan't lose the pore old dear yet; she seems to bring a blessing on the house. She's a gracious soul!'"

'A pretty penny she and John are making just now, I warrant,' was the indignant comment of Mrs Frost's grand-daughter.

This sad state of heart-burning and rivalry did not last long, however; for, four months after her arrival, the poor, harmless cause of it retired from the contest, glad to leave this bustling world. From that time forth, 'Neighbour Frost's' face wore an expression of unruffled serenity. Her prestige was restored; and when, some two years later, she was lying at the point of death, and her irrepressible grandson burst into the room with the intelligence that 'people had made up their minds when Grannie died, to have a grand berryin', and put up a stone to her in the churchyard,' her cup of joy was full—'Tell 'em,' she feebly faltered, 'to put on the stone, I wor over a hunderd, and the owdest in the parish, living or dead. Sally Simpson wor only ninety-nine.' With this 'Nunc Dimittis' she quietly closed her eyes. Her warfare was accomplished, her life 'rounded and complete.'

Although the day be never so long,
At last it ringeth to evensong.

A THOUGHT IN SUMMER.

It was a day in June; my heart, perplexed
With doubt and question, sick with hope deferred,
Hardened by press of common cares, and vexed
In toil of living—felt its pulses stirred
By throbbings of another, purer life—
Forgot its doubting, turned away from care,
Left for a while its weariness and strife,
To drink the sweetness of the Summer air,
To wait, and look, and listen. South winds blew
With touches light as mother-kisses laid
On sleeping infant brows. Two swallows flew
Swiftly on quivering wings athwart the glade,
Like flakes of snow in sunlight. Through the blue,
A fleecy cloudlet wandered; in its shade
A tremulous skylark hung. On every side
Gleamed leafy hedgerows, starred with Summer flowers,
And snowy hawthorn. In the distance, died
The cuckoo's faltering note. From nearer bowers,
Floated the soft, incessant, pleading cry
Of shy wood-pigeons. For all living things
Thrilled with a glad awakening life—and I
Felt in my heart the earnest of all Springs
And Summers yet to come, which neither pain,
Age, nor decay can touch—the living germ
Of life immortal. So my heart again
Gathered new courage, and with purpose firm,
Turned to its present living, strong to wait,
Fearless of wintry days and changing clime,
Ready to pass from winter through the gate
Of Death into the endless Summer-time.

PRICE 1½d.

ON HAVING A HOBBY.

It is matter of common observation that hobbies and their authors obtain but scant justice from the world at large. There are few persons who have not heard the pet projects of others mercilessly reviewed, and summarily condemned. The hobby-maker and the hobby-minder have come to be regarded as illustrative of a type of mental weakness out of which no good thing can be expected to come. Social history, however, is full of examples proving that many of the inventions which have revolutionised the world must have had their beginnings in studies that agree in every respect with the prevailing idea of a hobby. The whole history of invention is, in its earlier epochs, a record of hobbies, often frustrated, generally condemned, but afterwards bearing fruit in the shape of benefits and inventions which have made the modern world the wondrous age that it is.

It may thus be admitted that the repression of hobbies is often fraught with discouragement to a possible inventor, and may cause irretrievably the loss of many a useful art or process. There are, it is true, many absolute dreamers whose hobbies appear from their very nature to have no chance of realisation in any shape. We now look with lawful suspicion upon any attempt to make a pet project of 'perpetual motion;' and we do not hesitate to say even a harsh thing regarding the man who contends that the earth is a flat plain, in face of the school-boy's demonstration that the masts of an approaching vessel appear above the horizon before the hull. Such ideas are good examples of the hobby pure and simple, from the prosecution of which no good can be expected, and the study of which can be of no practical benefit to mankind, whose judgments, based on ascertained facts of science, are entitled to respect and belief. But the mistake commonly made consists in judging the merits of all subjects of special study by the demerits of a few hobbies; and against this

fallacy it is important that we should be on our guard.

There exist, however, another class of self-imposed studies, often pursued with avidity and care, but which meet with scant sympathy from the great bulk of even thoughtful and educated persons. We refer to hobbies connected with the abstract sciences, and with branches of study undertaken voluntarily and for no purpose of gain, but from what appears to be an infinitely higher motive—that of the social improvement of mankind, or of personal culture and higher education. Let us illustrate this class of typical 'hobbies' by a few examples. The employment of women in trades and professions hitherto closed to the sex, was deemed the hobby of a few energetic persons not so very long ago, even by those who might be supposed to have sympathised with the extension of the sphere of labour open to women, and with the increase of opportunities whereby the great army of working-women might earn their bread. Apart altogether from the vexed question of what higher professions are fitted for women, there remained the plain fact that many avenues existed wherein women might find profitable employment for their time, talents, and education. Yet, for long, the 'employment-of-women' question remained in the light of a veritable hobby. As such it was regarded by the outside public, and as such it met at first with but little sympathy from those who were best able to forward its interests. Now, however, opinion on this subject has completely changed. The hobby of a few earnest men and women has become part and parcel of our social order. Women now find employment in the most varied ways and fashions, and are enabled to earn a livelihood in positions of trust from which but a few years ago they were mercilessly debarred. The electric telegraph and postal services absorb a vast amount of female labour; the printing trade similarly employs females to a large extent; and these excellent examples but serve to indicate other results which the pursuit of a hobby—in

this case, a convertible term for a great philanthropic movement—has achieved.

Men and women with hobbies will thus, as a rule, be found to represent the vanguard of social movements of a highly important kind. The hobby of the temperance reformer seems to be more than justified by the amount of misery and crime proved to spring from intemperate habits; and notwithstanding the occasional absurdities of speech and argument into which a man's earnestness may carry him in this and in other social movements, no one will refuse to credit these reformers with a genuine love for their fellows, and with a strong desire to raise and elevate the social fabric of which they themselves form a part. How many delightful leisure hours are secured when music becomes the hobby of high and low alike; and how many sources of temptation would be avoided, especially by the working-classes, were such hobbies as gardening, flower-culture, music, and allied tastes more frequently cultivated. True, many of the movements of our day are of a very ephemeral kind. Some perish by reason of their extreme wildness; others, from the thinly disguised selfishness which appears to animate their whole procedure. But the lessons of the past teach us plainly that to be charitable in the matter of judging the pet schemes of others is a bounden duty; whilst the history of hobbies may also show us that mankind has often unconsciously endeavoured to repress the honest determination of thinking minds to benefit their race.

Of all hobbies which even in the present day meet with little sympathy from society at large, perhaps the 'hobby scientific' is the most notable. And yet on grounds not far to seek or difficult to find, such hobbies may be justified in a fashion and by arguments of a very convincing kind. A person from sheer love of nature, and impelled by tastes, of the origin of which he himself may perchance be unable to give any clear account, begins to cultivate some branch of science. At the root of his studies there is no desire to make gain by his pursuits. He employs his leisure time in the study, it may be, of chemistry, or in that of plants or animals; or hammer in hand, and bag on back, he explores the quarries, and returns laden with the records of the life of past worlds, which in the shape of 'fossils' he has gathered from the rocks. The mechanic, vasculum on back, starts on a Saturday afternoon on a botanical excursion, and spends his time in collecting and naming plants; in this way forming a catalogue of the flora of his district, and aiding in a most important fashion the endeavours of the man of science to obtain a complete record of the plant-life of the country. Another spends his leisure by the seaside, and works out the marine botany or zoology of his district. And a third, it may be, is an enthusiastic entomo-

logist, who, despite the sarcasm of his fellows respecting the ignoble pursuit of 'bugs' and 'beetles,' contrives to construct a catalogue of the insect-life of his shire, and to gain meanwhile no small insight into the works and ways of animated Nature. Of the beginnings of such studies the hobby-rider may, as we have remarked, be wholly ignorant. A science lesson at school may have struck the keynote of a longing desire to penetrate Nature's secrets, and to learn the story which, to the earnest mind, Nature is ever prepared to tell. Or a chance attendance at a lecture may have given an impetus to feelings already kindled in favour of a science-study as a profitable way of spending an idle hour. Thus day by day and year by year, the patient observer of Nature finds ever-increasing delight in his study of the world around him. To him Nature is like an illustrated book, the pictures and language of which he has, in part at least, learned to understand, and which affords him new delights at each fresh perusal.

Common experience shows that it is for studies and hobbies of such a nature that the stupid world has least sympathy. There are few persons who at some period or other have not heard comments unfavourable and sarcastic passed upon the student of Nature, who, finding delight and joy in the observation of the world of life around him, plods patiently onwards—his toil apparently meaningless, and his labours a mystery to his fellows. It is the reflection of such popular criticism upon the science-studies of the few, that is inimitably rendered in the *Ingoldsby Legends*, where the student of Nature is described as

Still poking his nose into this thing or that,
At a gnat, or a bat, or a cat, or a rat,
Or great ugly things, all legs and wings,
With nasty long tails armed with nasty long stings.

Whilst a still more succinct description, from the popular side, of the untoward tastes of scientific persons, is contained in the lines:

He would pore by the hour o'er a weed or a flower,
Or the slugs that come crawling out after a shower;
Black beetles, and bumble-bees—blue-bottle flies,
And moths were of no small account in his eyes;
An 'industrious flea' he'd by no means despise;
While an 'old daddy-long-legs,' whose long legs and
thighs
Passed the common in shape, or in colour, or size,
He was wont to consider an absolute prize.

Such a description of the habits of the student of Nature in one aspect, may be taken as a typical imitation of the verdict too frequently passed upon science-studies. There is no use, motive, or pleasure discernible to the popular eye in the 'weeds' of the botanist, or the slimy treasures which the zoologist gathers on the sea-beach. These things constitute hobbies with which nobody should have any sympathy, and for which it is surprising, according to the popular fiat, that anybody should have a taste. But unfortunately for the value of such arguments, the popular mind is hardly in the position to judge of the worth and pleasure of such studies. At

the best, such opinions are those of a special bias which, entirely unacquainted with the pleasures and mental profit such studies afford, is incompetent to pronounce a just verdict upon the matter in question. A wise writer, speaking of the scant sympathy which the mental hobbies of men and women meet with from the outer world, says: 'Whatever you study, some one will consider that particular study a foolish waste of time.' And again he asks: 'What, when it is not your trade, can be the good of dissecting animals or plants? To all questionings of this kind, there is but one reply. We work for culture. We work to enlarge the intelligence, and to make it a better and more effective instrument. This is our main purpose; but,' concludes this author, 'it may be added that even for our special labours, it is always difficult to say beforehand exactly what will turn out in the end to be most useful.'

In the foregoing words is contained the full answer to the popular quibbles respecting the hobbies of science-study in which we may indulge. We seek a culture which some favourite study alone can give. We wish to find an intellectual prop on which we may lean when our days of weariness come, and when the idle time with its *ennui* and air of do-nothing-ness approaches. But the utility of such studies is not unrepresented in the argument. Such hobbies increase our powers of observation, and train our perceptions to note, to weigh and balance probabilities; in a word, they serve as a direct means of mind-training in right methods of thought. The botanist's observation of a flower, for instance, in its exactness and precision, instils habits of a like kind which cannot fail to exert some influence on the business habits of everyday life. And thus the pursuit of a hobby may mean an absolute gain to the common business of existence. To cite but two well-known names from the workers in science who pursue their hobbies with benefit to themselves and to the world at large—Mr De la Rue is none the worse a business man because of his discoveries in astronomy, and Sir John Lubbock is at once a naturalist, a banker, and a member of parliament. Besides, it should be noted that in such hobbies the beginnings of great discoveries often lie hidden; and there are none amongst us who may value lightly the addition of knowledge to man's estate.

Not the least important uses of such hobbies that remain to be noted, are their effect of teaching us to enjoy life more fully, and the aid they give us in reaching those higher ideals which every consideration of life's value prompts us to attain. How much of the beauty and fairness of the world must we lose if outward Nature is simply a blank, and if we know nothing of the constitution of the universe around us. The feeling of delight in what is fair and bright is intensified a thousand-fold, when we begin to understand the *rationale* of Nature, and when every flower and insect speaks to us in a language of which we know something. To high and low alike, the pursuit of such hobbies must serve as a powerful means for encouraging aspirations after nobler desires and higher and purer pleasures. Every effort to understand the why and wherefore of Nature is in reality but an expres-

sion of the desire to seek and find a higher ideal. Hobbies form in reality the beginning to many of a new intellectual life; and the cultivation of such tastes is not a matter which should escape the notice of the educationist, who, in his contact with the young, and by encouraging a taste to observe, may lay the foundations of future studies which will assuredly tend to ennoble and to perfect life.

Speaking of the training of the young in what many persons would be apt to consider hobbies and nothing more, a writer in *Nature* (1870) aptly says: 'Few have yet realised the enormous gain that will accrue to society from the scientific education of our women. If, as we are constantly being told, the "sphere of woman" is at home, what duty can be more clearly incumbent upon us than that of giving her the opportunity of acquiring a knowledge of the laws which ought to guide her in the rule of her house? Every woman on whom the management of a household devolves may profit by such knowledge. If the laws of health were better known, how much illness and sorrow might be averted! What insight would a knowledge of chemistry afford into the wholesomeness or unwholesomeness of different articles of food! What zest would be given to a country walk with the children, or a month by the seaside, if the mother were able to teach the little ones intelligently to observe and revere the laws of Nature! Above all, what untold sufferings, what wasted lives, are the penalty we have paid for the prudish ignorance of the physiology of their bodily frame in which we have kept our daughters. These considerations have had far too little place with us at present. We trust that a new era is dawning upon us.'

Thus the despised pet schemes and studies of the few may be justified in their beneficial effects upon the many; and thus also may we learn to recognise that there may exist true wisdom in the much-abused practice of 'having a hobby.'

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

CHAPTER XXIV.—'OF HOW MUCH HAVE YOU ROBBED US?'

HAD Garling's nerves been of steel instead of the ordinary human fibre, a shade tougher than common, he must needs have shaken a little when that grip fell upon his arm and the voice of his employer sounded in his ear. His head turned slowly, and he looked across his shoulder, meeting Lumby eye to eye. There was a wicked light in the eyes of both men. The merchant looked like a duellist ready to give account of a hated foe; the cashier's glance was like a snake's. Away rumbled the train; and for a half-minute after it had gone, the two stood on the deserted platform, looking at each other in the light of a lamp which stood close by, casting its rays between them. In the tension of his nerves, Lumby gripped harder and harder. In the tension of his nerves, Garling was unconscious of the grasp, after the first shock it gave him. Cool and ready as he was by nature, and swiftly as his mind

recovered itself, that wicked frozen glance lasted long enough to betray him a hundred times over.

'May I ask,' he said in a voice that grated curiously, and had to be strangely forced to make it audible, 'the meaning of this rather remarkable greeting?'

The merchant kept his eyes upon him, and for sole answer gripped by the other arm and shook him, very slightly, but strongly. This position made it somewhat difficult for Garling to look round; for his employer having in the first instance approached him from the rear, had laid his right hand on Garling's right arm, and now having grasped the other with his left, he stood almost behind his captive. The latter made no attempt to move, but kept that wicked backward-glancing eye upon the other's face. 'Pray, explain this curious action!' he said in the same grating tones.

'You villain!' cried the other, shaking him anew—'you scoundrel!' His voice also had undergone a change, and sounded harsh and low.

'You will regret this violence,' said Garling.

Lumby, without replying, thrust an arm through his, and led him from the platform. It would have been useless for Garling to resist, and he knowing that, was too wise to try. Lumby held to him so tightly, that when they came to enter the hansom, they bundled in together awkwardly, and the cashier found divers corners of himself confused. The cabman having received his instructions, drove in the direction of the offices, and the merchant gripped his captive all the way. In Garling's mind there was such blank despair and rage as only a foiled scoundrel is permitted to experience. To have come so near, after waiting so long, and at last on the very verge of victory, to be thus ignominiously taken, was maddening. Frenzies of rage and disappointment shook his heart, and if he had had a weapon in his hand, there were moments in that brief ride in which he would have willingly struck his captor dead. But he had still a stake to play for, though all his base gains of the past nine years were lost; and that stake was dear to him, for it was nothing less than liberty. There was such a strain of caution in the man, that he had counted on this failure all along, and had planned as carefully to meet it as if it had been certain. Not that it was any the less exasperating, now it came, for this prevision. His murderous glance, as he cast it now and again sideways on the fixed and silent face beside him, was warrant enough for that.

The offices being reached, Mr Lumby made the cabman dismount and ring the bell; and it was not until the night-watchman had opened the door that he permitted Garling to alight. 'Something' real serious on foot,' thought the night-watchman, noting even on Garling's impassive face a shade he had never seen there until now, in all his knowledge of him. The cabman dismissed, the merchant marshalled Garling to his own room. As he went, the cashier saw that the gas jets were lighted all along that way, and nowhere else, as though warning had been given of their coming. He was in a mood to notice everything more closely than usual, and the great doors closing outside sounded to him like the closing of the

doors of a jail with him an inmate. At any other time, he thought, the sound would have fallen on his ears unheeded. He was cool enough to smile at that, and to murmur to himself 'Nerves!' by way of explanation.

The merchant locked the door, and always holding a wary eye upon the other, turned up the gas. Garling laid his hat upon the table, and stood observant. There was so little change in him, so little sign of fluster or fear, that his employer was almost staggered, looking at him. Could he look so cool, and yet be guilty? They faced each other.

'I have had reason given me lately,' said Lumby slowly, panting a little as he spoke, 'to suspect your probity. I have been making an investigation of those books, and have found that you began a fraud upon the firm nine years ago. I presume, since I found you in the act of escape to-night, that you have completed your fraud. Or had you learned that I was tracing you?'

Garling looked at him with glittering eyes, his head bent somewhat downward, his lips drawn tighter than was common with him, and a little paler. His skin had fallen from its ordinary sallow hue to a sort of stony gray.

'When did he begin to suspect?' he asked himself. 'How much does he know? Is there anything I can save from this ruin of my plans?' But he answered never a word.

'Speak!' said the merchant, panting at him, in an agitation terrible to look at. 'Of how much have you robbed the firm?' His face was alternately gray and purple. His features jerked and quivered, his hands shook, and a visible tremor possessed his whole body.—Garling read his own advantage in all these signs, and still said not a word.—'Speak! you—you scoundrel!' cried Lumby falling anew upon him, and seizing him by the waistcoat and the bosom of his shirt. 'Of how much have you robbed us?'

'Of not one halfpenny!' said Garling stonily. The words and manner so amazed the merchant that he dropped his hands. The cashier moved quietly, so as to place the table between them, keeping his eyes on Lumby as he stepped, and, laying one hand on the table, leaned slightly forward, whilst with the other he arranged his disordered dress. In this attitude he spoke again: 'Of not one halfpenny, or of everything—according as you use me.'

If any third person could have looked upon the scene at this minute, he might well have been excused had he mistaken the several parts they played. The just employer sank into a seat with his hands drooping by his sides and a face of extreme pallor. The fraudulent cashier, pale enough in all conscience, but self-possessed and firm, looked down upon him across the table, still fumbling with his hand at his bosom. Coupled with the calm in which he stood and the cruel look upon his face, the action, simple as it was, seemed deadly. It was as if he searched slowly and calmly for a weapon, and had the will to use it. Lumby made a great effort, and resumed something like composure.

'I might have guessed beforehand,' he said slowly, in a voice unlike his own, 'that if you chose a criminal course, you would go boldly and warily. I know now that you have chosen

such a course, and I tell you that the safest plan for you is to make a clean breast of it and confess everything. Of how much have you robbed us?'

'Either of nothing, or of everything,' responded Garling. 'It is in your power to bring down utter ruin, or to recover all. Your treatment of me will determine that.'

'You mean that the firm is in your power?'

'Precisely,' said Garling.

'I do not know how that can be,' said Lumby; 'but it is a question easily tested.' He struck his hand heavily upon the bell which lay upon the table.

'I recommend you to pause,' said the cashier coldly. 'If you fulfil your present purpose, you are ruined.'

'I will see,' returned the merchant.

'You will see,' said Garling calmly. 'You propose to arrest me? Good. You may save yourself the trouble of opening your doors to-morrow. If I am arrested, the firm is bankrupt—hopelessly insolvent.'

'We shall see,' said Lumby. The cashier's voice and face, however, made such impression on him, that when the heavy footsteps of the night-watchman sounded in the corridor, he arose and waited at the closed door for his knock. The knock came, and Lumby opening the door, said only: 'Wait at the end of the corridor. I may want you in a moment.' He kept his eyes on Garling; and if in that stony and impassive countenance of his he had read a touch of fear or of boasting, either would have decided him. But he saw neither one nor the other. Garling had this advantage: he was enacting in earnest a scene which he had countless times rehearsed in fancy—and to play it well or ill was almost life or death to him. The door was closed and locked again, and the heavy footsteps retreated to the end of the corridor. Lumby, though liable to sudden gusts of passionate anger, and less under control than the other, was growing strung to something like the enemy's pitch. The intensity of mood had been beyond words already; but the intensity of manner was now increased tenfold by the near neighbourhood of the man, which reduced speech almost to a whisper. The merchant felt he had nothing to lose by a pause—he could afford to wait long enough to get light to go by.

'Are you prepared,' he asked, 'to make a full confession and restitution? Is that your meaning?'

'I may be induced to mean something like that,' the cashier answered.

'You may be induced?'

'I may be induced.' The villain's composure was a study.

'To mean something like that?'—with bitter irony.

'Something nearly approaching to it; yes'—with perfect business-like precision and quiet.

'Will you be so good as to tell me how we are in your power?'

'I will explain,' said Garling, clearing his throat slightly.

'Thank you,' returned Lumby—'if you will be so good.' Their eyes met again, and Garling's fell. His face became a little paler in its gray; but he cleared his throat again and went on.

His hand was still fumbling at his breast automatically, though he had forgotten the purpose which first sent it there.

'I proceeded in this matter,' he said harshly and drily, 'with much caution and foresight. I have never been a spendthrift, and in fact I have always lived well within my income. As a result of that, I have been enabled to employ such sums as I have transferred to my own service to considerable advantage, and ultimately to pass them, through varying channels, to swell the store I had begun to accumulate abroad.'—The merchant listened with a face as gray as Garling's own.—'The accumulations becoming in course of years, say three or four years, considerable, I was enabled to keep up a constant circulation of capital with such irregular additions and diminutions in the flow as would occur naturally in the course of an extensive business. At the end of perhaps five years, the impossibility of further operations of that simple order clearly declared itself. But by throwing up my plans at that time, I should have killed the goose which laid the eggs without having filled my basket. You will understand that at this time—now four years ago—everything that could be drawn from the firm in its then condition had been drawn, and that the firm lived by the continued circulation of that foreign hoard. I had laboured, as you know, to increase the scope of the House's operations, and in that direction I still laboured with some not inconsiderable measure of success.' Half-a-dozen times in the course of this statement the cashier raised his eyes, and meeting his employer's glance, looked down again. 'It would have been possible, since the original capital of the House was not only intact but multiplied, to have proceeded upon this plan indefinitely. But I found myself already past middle age, and—delays are dangerous. The channels in which the funds flowed—if I make myself clear—were circular. It was competent for me to arrest them at any point of the circle. That was a work of much delicacy, and demanded care and time. You will excuse me for offering you at this point only a general statement, and for avoiding detail which might obscure a broad view of the position. In brief, the various channels have all been directed into one reservoir, and have there discharged themselves. There is a drop or two in the London pipes, but nothing elsewhere. And the disadvantage of the House, and my advantage is, that the reservoir is available to me only.'

Mr Lumby sat still and looked at Garling. He had read of frauds, heard of them in plenty, had even assisted at the investigation of one or two; but he had never met with anything like the massive insolence, the colossal audacity of this defrauder.

'You had completed your work,' he said at length, 'and you were going to-night'—Garling slightly inclined his head, and moistened his dry lips a little with the tip of his tongue—'leaving the firm insolvent?'

'Leaving the firm insolvent!' Garling answered like a husky echo.

'And being caught,' said Lumby with a transient flush of triumph, 'you are ready to disgorge?'

'Partly,' answered Garling, 'and upon conditions.'

'I will accept no partial restoration,' said the merchant, by this time restored to full possession of himself, 'and I will make no conditions with you.'

'That is for you to decide,' responded Garling, 'not for me. But except upon my own conditions, my lips are sealed. You have no clue—forgive me if I lay the matter before you plainly—you have no clue at present to the whereabouts of the money, and if you should discover it, you cannot handle it.'

'I can send you to penal servitude, probably for life,' returned the merchant; 'and having done that, I can accept my fate equably.'

'You are willing to buy revenge at too dear a rate,' said Garling; 'and so far you have nothing to punish but the intention of a wrong. I heard it whispered this afternoon that you had intended to introduce Mr Gerard into the firm. If his wishes were consulted, now?'

'Garling,' said the head of the firm with measured sarcasm, 'it is to be regretted that you have made so poor a use of your talents. I had always a high opinion of your powers, and until now I never saw the flaw in them, or you. In me, you are utterly mistaken. You measure me by yourself, and in doing that you really offer me too much injustice. I will have no traffic with you until I have a full and complete surrender. I will make no promise, or hint at any promise, until you throw yourself entirely on my mercy; for I vow,' he cried with a sudden passion of righteous anger, 'that I would rather see my son break stones by the wayside, than make him a Cæsar by stooping to barter with your villainy! Decide then, and decide quickly. You may beggar me and mine; but, please God, you shall not smear our honest hands by passing any gift to them through yours.' Before this burst of wrath, Garling bowed his head gravely and quietly, and spread both hands abroad a little, as if deprecating an exaggerated view of things. Seeing this, the merchant again brought his hand down heavily upon the bell; and the watchman—who had heard his master's voice raised high in anger—came with alacrity to answer it. 'Decide!' said Lumby again, in a high voice, which rang like a knell in Garling's ears. But the cashier had played his game too long to be willing to relinquish all; and what daring could do he would do. With him the position was like that of a player in the American game of 'Brag,' and he had a shrewd suspicion that Lumby was in something of the same mood with himself. So, when the merchant cried 'Decide!' he waved his hands again with a repetition of the deprecatory gesture, and with a little downward motion of the head, he answered: 'I have decided.' The passionless gray of his face fell a tone lower, and Lumby saw it. Everything depended—for Garling's surmise respecting him was true—or seemed to depend, on his own promptitude and fearlessness of action. He called 'Come in!' in answer to the watchman's knock, and threw the door wide open.

'You abide by your decision?' he asked briefly and sternly.

'I abide by it,' was Garling's answer. 'Yes.' His cue was to conceal emotion, and he followed

it well; but he could not hide the moisture on his forehead, nor the twitching of his ashen lips, nor the tremor of his hand.

'I have your last word?' said Lumby. 'Remember! The next step is beyond recall.'

'So be it,' returned Garling. Since the opening of the door, their colloquy had been carried on in a low murmur, apart from the watchman, who, having advanced no farther than the mat in the doorway, stood there respectfully, twirling his cap in both hands. Lumby with one look, which fell full in Garling's eyes, turned to the man. He had but addressed him by name, when the cashier's voice, chill and measured, rose behind him, saying: 'Horton! You may go outside for a moment, and close the door.'—The man, with a look at his employer, obeyed.—'I throw up my hand,' said Garling. It was well for him that he read faces quickly and truly, and that he could estimate aright the resolution expressed in the gesture with which the merchant had turned away from him. 'I ask only one pledge.'

'I will give you no pledge at all,' returned the merchant.

'Permit me,' said Garling drily, pushing a letter-clip along the table with one hand and trifling with the spring. 'In this matter, I would venture to urge that you have scarcely any option. It is of more importance to recover your money than to have me transported. Until I receive your pledge that I go free, I will not speak a word.' His employer looked at him with a doubtful mastery of aspect. 'Observe. To imprison me is to call down certain ruin. Give me the pledge I ask for, and you have power enough to shake your last halfpenny from me.—You have brains enough to see that!' he added coarsely.

Lumby regarded him steadfastly. 'You are a cunning villain, Garling, and you have laid your plans well. I suppose I must wrong society by turning you loose upon the world. Have you—forgive my curiosity—any remorse for having rewarded an old friend's kindness in this way? Why, you cur, have you no memory of the favours heaped upon you? Haven't you a blush? The blood is ashamed of that fox face of yours, and runs away from it. You scoundrel!' This speech was dictated by many impulses. There was satire in it, and sorrow in it. There were contempt and anger. The final expletive was one of almost unmingled wonder. As for Garling, there was no denying that he bore the situation well. He had failed. The long-drawn and elaborate plot on which his splendid financial genius had for nine years centered itself, had crumbled to dust in an hour, every strand and thread of it dissolved, as though it had been woven of sand. He made no pretence of not caring, and gave no sign of being overwhelmed. He did not rage, and he did not fall into flippancy. He had missed the issue of his life, and this failure told him so. He had been phenomenal among swindlers, and had failed as vulgarly, and been caught as ignominiously as any city 'prentice who steals from the shop-till and is taken by the ear in the act. Where under these circumstances was the good of having been phenomenal! And here was old age coming—he felt old now—he had been young twelve hours ago, comparatively—

and he was dishonoured and thrown loose upon the world. Well, he would not grumble. He had weighed the stakes before he played for them, and he had staked and—lost. All that was left now was to come out of the ruin with as little damage as possible—or at least with as little sign of damage. So he bore his employer's reproaches with a contempt which under the circumstances was hardly curious.

'Let us be business-like,' he urged.—The Leviathan impudence of this reproach struck Lumby dumb, and even when he had recovered, it had the effect of restraining any further expression of his wrath. Speech was plainly of no effect in this case.—'If,' pursued Garling, 'you will draw up a statement of your own intention with regard to me, I will put into your hands my private ledgers, which will show you everything at a glance.'

'Are you so ignorant of the criminal code of England,' asked Lumby, 'as to suppose that any assurance of mine given now can hinder me from prosecuting you?'

'I am not so ignorant of *you*,' returned Garling, 'as not to know that you will not expose yourself as having gone back from your written word.'

'You have my word,' said the merchant.

'I can't show your word in court, if you deceive me,' said Garling.

'I suppose,' asked Lumby, 'that you have no belief in any man's honour?'

'I never had,' responded the defrauder grimly. And there, probably enough, was the key to his ruin. Lumby yielded, and wrote out the pledge he asked for, setting forth that it was given only on condition of complete restitution. Garling thereafter sat down at the table and prepared an abstract report of his villainy. It took an hour or two's hard writing; and Lumby read it sheet by sheet as the late cashier laid it methodically by. It was luminous, and the very soul of brevity, considering its mass of unavoidable detail. Garling's financial genius permitted him to append to this report a sort of swindler's balance-sheet, in which the precise position of affairs was shown, and wherein, by a marvellous effort of memory, dates and figures were set down, as it afterwards turned out, with scrupulous exactness.

'My private ledgers,' said Garling, 'will afford more extended information. The final appeal must be made here.' He pointed to the vast volumes ranged along one side of the room. 'But that,' he added, 'will be a work of time.'

The balance-sheet at the end of Garling's abstract had rather an air of hocus-pocus to the merchant. It seemed scarcely credible, for one thing, that memory should be so minutely retentive; and he insisted, without loss of time, on comparing it with the defrauder's private entries. To this end, between two and three o'clock in the morning, he escorted the cashier home. Before he started, however, he locked the confession in his own drawer.

'It might seem worth while to murder me for that, if you had a chance to do it in your own place, quietly—eh, Garling?'

'No,' responded Garling, with a voice of tranquillity. They walked to what had been Garling's home together, and they worked till daylight. The merchant made him sit down at the table,

whilst he stood behind him, or occasionally, for a change of posture, knelt upon a chair.

'It is now eight o'clock,' said Lumby, when the balance-sheet was verified. 'You will report yourself at the office to me at ten. If you are five minutes late, I shall give information to the police.'

(To be continued.)

SOME CURIOUS ADVERTISEMENTS.

ADVERTISING has in these days become quite an art in itself, so much so, that it is seldom now that one meets with the curiously worded and exceedingly misspelled advertisements that at one time used to amuse the readers of the daily and weekly press. An advertisement to the effect that the genuine Old Moore's Almanac for the year 1882 is only to be had of a certain publisher, recalls to mind another which appeared in the prints of 1712 at the instance of 'Old Moore' himself. It runs as follows: 'At the Old Lily, near the Barge House, in Christchurch Parish, Southwark, at London, liveth Francis Moore, licensed physician and student in astrology, who, by the blessing of God, cures all sorts of agues with one dose, in young and old, when left off by others. He hath an excellent medicine for Fits in young people and children; he has an excellent Worm-powder, and a Family Tincture that gives present ease in Colic, and carries off all pains in an instant. He gives Judgment in the Astrological way. He desires all that send to him out of the country to pay the postage of their letters, or expect no answer.'

In *Parker's London News* of January 28, 1722, there is the following announcement: 'Whereas gentlemen and gentlewomen in walking the streets in dirty slabby weather very frequently incommode their stockings and petticoats by the filth thereof. There is a person who gives daily attendance from nine to three in the afternoon at the *Hercules* in Nags-head Court, in Bartholomew Lane, behind the Royal Exchange, to instruct how all persons may walk the streets without dirting themselves in the worst or dirtiest weather.'

The following is the advertisement of one who might be termed a 'handy man': 'James Williams, parish clerk, saxtone, town-crier and bellman, makes and sells all sorts of haberdasheries, groceries, &c., likewise hair and wigs drest and cut on the shortest notice. N.B.—I keeps an evening school, where I teach at reasonable rates reading, riting, and 'rithmitic and singing. N.B.—I play the hooboy occasionally if wanted. N.B.—My shop is next door, where I bleed, draw teeth, and shoo horses with the greatest scil. N.B.—Children taut to dance if agreeable at sixpence per week, by me, J. Williams, who buy and sell old irin and coats—boots and shoes cleaned and mended. N.B.—A hat and pr of stockens to be cudjelled for, the best in 5 on Shrof Tushday. For particulars enquire within, or at the horse shoo and bell, near the church, on t'other side the way. N.B.—Look over the door for sign of 3 pidgeons. N.B.—I sells good ayle, and sometimes cyder. Lodgings for single men. N.B.—I teach jografy, algebray, and them outlandish kind of things. A ball on wensdays and fridays.'

A specimen of an indignant advertisement

appeared in the *Times* in 1874: 'Should this meet the eye of the lady who got into the 12.30 train at New Cross Station on Friday, May 15, with two boys, one of whom was evidently recovering from an illness, she *may be pleased* to learn that three of the four young ladies who were in the carriage are very ill with the measles, and the health of the fourth is far from what her relations could desire.'

The following, from an indignant husband, is culled from one of the Irish papers: 'Run away from Patrick M'Dallogh. Whereas my wife, Mrs Bridget M'Dallogh, is again walked away with herself, and left me with her four small children, and her poor old blind mother, and nobody else to look after house and home, and, I hear, has taken up with Tom Gingan, the lame fiddler—the same was put in the stocks last Easter for stealing Barday Doody's game cock: This is to give notice, that I will not pay for bite or sup on her or his account to man or mortal, and that she had better never show the mark of her ten toes near my home again.—PATRICK M'DALLOGH. N.B.—Tom had better keep out of my sight.'

Considerably more than a century ago, a breeches-maker thus advertised his new method of manufacture: 'Breeches-making improved by Geometry. Thomas Nunn, Breeches Maker, of 29 Wigmore Street, Cavendish Square, has invented a system on a mathematical principle by which difficulties are solved and errors corrected. Its usefulness for ease and neatness in fitting is incomparable, and the only perfect Rule for that work ever discovered. Several hundreds—noblemen, gentlemen, and others—who have had proof of its utility, allow it to excel all they ever made trial of. N.B.—An improved method is adopted for keeping them clean without discommoding by dust.'

At Margate, in the beginning of the present century, a well-known character named Bennett, who let out donkeys on hire, issued the following poetical advertisement, containing a very delicate compliment to his fair customers:

Cows' milk and asses' too, I sell,
And keep a stud for hire,
Of donkeys famed for going well,
And mules that never tire.
An angel honoured Balaam's ass
To meet her in the way,
But Bennett's troop through Thanet pass
With angels every day.

At a time when our papers are literally beset by money-lenders with their announcements, the subjoined advertisement, which appeared in *Lloyd's Evening Post* of 1776, may not be without interest: 'Money wanted—when it can be procured—one hundred pounds. No security can be given for the *Principal*, and possibly the interest may not be punctually paid. Under the above circumstances, should any one be willing to lend the desired sum, he will much *surprise* and particularly *oblige* the author of this advertisement.—A.B.C., George's Coffee House, Haymarket.'

Freemasons in the year 1770 must have been rather surprised and amused to read the following announcement in the new *Newcastle Courant* of January 4th of that year: 'This is to acquaint the public—That on Monday the first instant,

being the Lodge (or monthly meeting) Night of the Free and Accepted Masons of the 22d Regiment, held at the *Crown*, near Newgate (Newcastle), Mrs Bell, the landlady of the house, broke open a door (with a poker) that had not been opened for some time past; by which means she got into an adjacent room, made two holes through the wall, and, by that stratagem, discovered the secrets of freemasonry; and she, knowing herself to be the first woman in the world that ever found out the secret, is willing to make it known to all her sex. So any lady who is desirous of learning the secrets of freemasonry, by applying to that well learned woman (Mrs Bell that lived fifteen years in and about Newgate), may be instructed in the secrets of masonry.' It would be interesting to know how many pupils she obtained, and why she appealed to her own sex in particular, seeing that there are almost as many men as women who would be curious enough at any time to learn the secrets of masonry without being properly initiated into the Order.

We always thought that prize-fighting and boxing were the especial privilege of the stronger half of human nature; but from the following challenge and answer, which appeared in 1722, it would appear that women also took some delight in the pugilistic art: 'I, Elizabeth Wilkinson, of Clerkenwell, having had some high words with Hannah Hyfield, and requiring satisfaction, do invite her to meet me upon the stage and box me for three guineas, each woman holding half-a-crown in each hand, and the first woman that drops the money to lose the battle.'

'I, Hannah Hyfield of Newgate Market, hearing of the resoluteness of Elizabeth Wilkinson, will not fail, God willing, to give her more blows than words, desiring home blows and from her no favour; she may expect a good thumping!'

History does not record the result of this famous set-to, nor yet of the following one, which is quite as characteristic in the wording of the challenge and answer. The advertisements appeared in the *Daily Post* of July 17, 1728, and the match was announced to take place at Mr Stokes' Amphitheatre in the Islington Road, London:

'Whereas I, Ann Field of Stoke-Newington, ass-driver, well known for my abilities in boxing in my own defence wherever it happened in my way, having been affronted by Mrs Stokes, styled the European Championess, do fairly invite her to a trial of the best skill in boxing, for ten pounds, fair rise and fall; and question not but to give her such proofs of my judgment that shall oblige her to acknowledge me Championess of the Stage, to the entire satisfaction of all my friends.'

'I, Elizabeth Stokes, of the city of London, have not fought in this way since I fought the famous boxing-woman of Billingsgate twenty-nine minutes, and gained a complete victory (which is six years ago); but as the famous Stoke-Newington ass-woman dares me to fight her for the ten pounds, I do assure her I will not fail meeting her for the said sum, and doubt not that the blows which I shall present her with, will be more difficult for her to digest than she ever gave her asses!'

Perhaps the most curious advertisement for a wife that ever appeared in any paper was that published in *Bell's Weekly Messenger* of May 28, 1797. It ran as follows: 'Matthew Dawson, in Bothwell, Cumberland, intends to be married at Holm Church, on the Thursday before Whitsuntide next, whenever that may happen, and to return to Bothwell to dine. Mr Reid gives a turkey to be roasted; Ed. Clemenson gives a fat lamb to be roasted; William Elliott gives a hen to be roasted; Joseph Gibson gives a fat calf to be roasted. And in order that all this roast meat may be well basted do you see, Mary Pearson, Betty Hodgson, Mary Bushley, Molly Fisher, Sarah Briscoe, and Betty Porthouse, give each of them a pound of butter. The advertiser will provide everything else for so festive an occasion. And he hereby gives notice to all young women desirous of changing their condition, that he is at present disengaged; and advises them to consider that although there be luck in leisure, yet in this case delays are dangerous; for, with him, he is determined it shall be first come first served.

So come along lasses who wish to be married;
Matt. Dawson is vexed that so long he has tarried.'

The great fondness which ladies sometimes show for domestic animals, especially lapdogs, is well known; but out of the numerous advertisements which have appeared for these little creatures from time to time, none has been more curious than the following, in the *Daily Advertiser* of November 1774: 'An exceeding small Lap-Spaniel.—Any one that has such a one, of any colour or colours, that is very, very small, and with a very short round snub nose, and good ears; if they will bring it to Mrs Smith, at a coachmaker's over against the *Golden Head*, in Great Queen Street, near Lincoln's Inn Fields, they may (if approved of) have a very good purchaser. And to prevent further trouble, if it is not exceeding small, and has anything of a long peaked nose, it will not at all do. And nevertheless, after this advertisement is published no more, if any person should have a little creature that answers the character of the advertisement, if they will please to remember the direction, and bring it to Mrs Smith, the person is not so provided but that such a one will still at any time be hereafter purchased.'

In the year 1783, a Scotch newspaper published the following advertisement: 'To be Let, a Beggar's Stand in a good charitable neighbourhood, bringing in about thirty shillings a week. Some good-will is required. N.B.—A dog for a blind man to be disposed of.'

We will conclude our paper with an advertisement which was published in the *Daily Advertiser* of 1798 by a gentleman whose house in Stanhope Street had been burglariously entered and robbed of valuable things: 'Mr R. of Stanhope Street presents his most respectful compliments to the gentlemen who did him the honour of eating a couple of roasted chickens, drinking sundry tankards of ale, and three bottles of old Madeira, at his house on Monday night. In their haste, they took away the tankard, to which they are heartily welcome; to the table-spoons and the light guineas which were in the old morocco pocket-book, they are also heartily welcome; but

in the said pocket-book there were several loose papers which consisted of private memorandums, receipts, &c., can be of no use to his kind and friendly visitors, but are important to him; he therefore hopes and trusts they will be so polite as to take some opportunity of returning them. For an old family watch which was in the same drawer, he cannot ask on the same terms; but if a way could be pointed out by which he could replace it with twice as many heavy guineas as they can get for it, he would gladly be the purchaser.'

A few nights after this advertisement appeared, a packet was placed in the area of the house, containing the following amusing communication from the burglars: 'SIR—You're quite a gentleman. Not being used to your Madeira, it got into our upper works, or we should never have cribbed your papers. They all be marched back again with the real book. Your ale was mortal good; the tankard and spoons was made into white soup in Dukes Place two hours after daylight. The old family watch-cases were at the same time made into brown gravy, and the internals, new christened, are on their voyage to Holland. If they had not been transported, you should have them again, for you are quite the gentleman; but you know as they have been christened and got a new name, they would no longer be of your old family. And soe, sir, we have nothing more to say, but that we're much obligated to you, and shall be glad to serve and visit you by nite or by day, and are your humble servants to command.'

ON THE SPUR OF THE MOMENT.

It is frequently observed that names utterly unknown before, rise suddenly into notice, and become for a time household words, solely through their owners having been able at some critical time to act on the spur of the moment. To such occurrences our army and navy records can testify; battles have been won, ships saved, lives rescued, and heroic deeds performed, solely by some one being able to act on the impulse of the moment.

Occasionally, however, very awkward consequences have been known to follow from acting on the spur of the moment. It is related of Lord Ellenborough that, when on one occasion he was about to set out on circuit, his wife expressed a wish to accompany him, a proposition to which his lordship assented, provided there were no bandboxes tucked under the seat of his carriage, as he had too often found there had been when honoured with her Ladyship's company before. Accordingly, they both set out together, but had not proceeded very far before the judge, stretching out his legs under the seat in front of him, kicked against one of the flimsy receptacles which he had specially prohibited. Down went the window with a bang and out went the bandbox into the ditch. The startled coachman immediately commenced to pull up, but was ordered to drive on and let the thing lie where it was. They reached the assize town in due course, and his lordship proceeded to robe for the court. 'And now, where's my wig?—where's my wig?' he demanded, when everything else had been donned.—'Your wig, my lord,' replied the servant

tremulously, 'was in that bandbox your lordship threw out of the window as we came along.'

Second thoughts are generally said to be best; and an old adage bids us 'think twice before we speak once.' In these go-ahead times, however, scarcely any one but a very slow person indeed would consider it sound policy to follow to the letter these really kind and inestimable precepts, laid down for our guidance by our great-great-grandparents. Yet, remarks made on the spur of the moment have not unfrequently a meaning which was not quite what the speaker wished to convey. For instance, two ladies having missed 'the meet,' drew up their pony-trap, and one of them accosted the old gamekeeper who was passing: 'Do you know where the hounds are, Robins?' 'Y'are just too late, ma'am,' was the answer; 'the gentlemen be all gone.'—On another occasion, a matter-of-fact corporal was compelled to bring a refractory soldier before his superiors, and his account of the delinquent ended in this way: 'Why, you see, Major, he thinks he can go out whenever he likes, and come in when he likes, swagger about, tell lies, get tipsy—and in fact, sir, behave just as if he was an officer.'—Again, two gentlemen met in the City, and at parting, one said: 'Well, you'll look us up at Primrose Hill—near the "Zoo," you know?'—'With pleasure, my dear fellow,' was the response; 'my children have been anxious for some considerable time to see the monkeys.' These and other similar expressions are doubtlessly spoken innocently, and without due consideration as to their consequences.

During a wild and raging storm at sea, the chaplain nervously asked one of the crew if he thought there was any serious danger to be apprehended. 'There is, and no mistake,' replied the sailor. 'If it keeps on blowing as hard as it does now, I reckon we shall all be in Paradise before twelve o'clock to-night.'—The chaplain, terrified at the answer, cried out: 'Shall we? Heaven forbid.' Circumstances alter cases; and words hastily uttered and passed unnoticed at one time, would not be perhaps seriously countenanced at another. We must therefore make many allowances for what is spoken on the spur of the moment.

Once, when Bishop Burnet was preaching before Charles II., the preacher became much warmed with his subject, and having given utterance to a certain doctrine in a very earnest manner, he with great vehemence struck his clenched hand upon the desk and cried out in a loud voice: 'Who dare deny this?'—'Faith,' observed the king, in a key very little lower than that of the preacher, 'nobody that is within reach of that great fist of yours.' This took place about a couple of centuries ago, when the habits and customs of the people were rather different from those of the present day. Were an interruption of a similar kind to occur now, it would probably be the cause of no slight confusion. Freedom of thought is, however, very natural, as the following instance will show. The butler of a certain Scottish laird, who had been in the family a number of years, at last resigned his situation because his lordship's wife was always scolding him. 'Oh!' exclaimed his master, 'if that be all, ye've very little to complain of.'—'Perhaps so,' replied the butler; 'but I have

decided in my own mind to put up with it no longer.'—'Go, then,' said his lordship; 'and be thankful for the rest of your life that ye're not married to her.' In this case, the grievance of the faithful domestic, and the humorous admission of his master, point at once to that disagreeable tenant known as the skeleton which is said to inhabit every man's household.

Another example may be taken as a 'diversity of opinion,' and thoroughly applicable to our subject, but by no means flattering to the principal speaker. Some years ago, a clergyman in Perthshire, who was considered more skilful as an angler than popular as a preacher, was once giving advice to a parishioner on the benefits of early rising, and mentioned as an instance, that a few mornings ago he had before breakfast composed a sermon and killed a salmon. 'In fact,' added the parson, 'it is an achievement on which I plume myself greatly.' 'Aweel, sir,' replied the man, 'I would much rather hae yer salmon than yer sermon.'

It is without doubt entirely to speaking on the spur of the moment that we are indebted for these humorous outbursts. In the 'good old times,' a carpenter, who could not get his money for two gibbets that had been bespoke, refused to make a third, and an execution was in consequence delayed. The jailer being called to account, blamed the carpenter, who was at once summoned before the judge—a gentleman, by the way, somewhat remarkable for his severity. The judge demanded of the carpenter the reason why the work had not been done. 'I refused,' said the man, 'to make a third gallows because the jailer had not paid me for the two first.'—'But you must understand,' said the judge, rather angrily, 'that I myself ordered this one.'—'Oh, in that case,' said the carpenter, 'I will make it at once. It should have been ready long before this, if I had only known the gallows had been for your lordship.'

We may remark, too, how vastly interesting it is to contemplate the activity and perseverance which almost every individual exhibits in his own individual interest. Cooke the tragedian was in the habit of giving passes to a widow lady, who upon one occasion occupied a prominent seat in the pit with her little girl, when their friend the performer was about to meet an untimely end by a stage-rival. As the villainous-looking assassin, armed with a deadly weapon, stealthily drew near to accomplish his wicked purpose, the maiden, roused by the supposed imminence of his danger, started up, anxiously exclaiming: 'Oh, pray, don't kill him! don't kill him! For if you do, he won't give us any more orders for the pit.'

We can readily conjecture how the gravity of the situation was upset by this sudden outburst of feeling—undeniably spoken on the spur of the moment. Simplicity, however, according to Longfellow, is, 'in character, in manners, in style, and in all things, the supreme excellence.' 'Patrick,' said an Irish gentleman to his servant one morning, 'I heard last night, from undoubted authority, that you have had the audacity to go and tell some people that I was a shabby old rascal, a mean fellow, and anything but a gentleman. I am told that those were your exact words.'

—'Bedad, sor,' replied Pat, 'and it's there ye're quite wrong. I can assure you, sor, that I don't tell me private thoughts to every wan.'

Steele laid down the maxim that it was decidedly wrong to allow any one to be so familiar with you as to praise you to your face. We are told that the wives of men of sentiment invariably adopt this rule, and are not always the most appreciative of women. It is related of Siebenkees, an eminent German scholar, that having finished reading one of his beautiful imaginings to his wife, who appeared to be listening with bated breath and eyelids cast down, he closed the book with inward satisfaction at the completion of his labours, only to hear the sharer of his joys exclaim: 'My dear, pray don't put on your left stocking to-morrow—I see there is a hole in it.' There was evidently neither praise nor encouragement in this remark, but the reader will perceive it was made on the spur of the moment.

Sometimes the greatest compliments, by being awkwardly expressed, may tend to give offence. A clergyman in the country had a stranger to officiate for him one day, and meeting his beadle afterwards, he said to him: 'Well, Dougall, how did you like last Sunday's preaching?'—'It was a great deal owre plain and simple for me,' replied the beadle. 'I like sermons that jumble the judgment and confound the sense. Od, sir, I never saw a ne that could come up to yourself at that!'

It was Pope who remarked, that a person who is too nice an observer of the business of the crowd, like one who is too curious in observing the labour of the bees, will often be stung for his curiosity. Bishop Horne had his dignity considerably taken down when he arrived to take possession of the episcopal palace at Norwich in 1791. Being amazed at the number of spectators on the occasion, he turned round upon the steps and exclaimed: 'Bless us, bless us! what a concourse of people.'—'Oh, my lord,' said a bystander, 'this is a mere nothing to the crowd last Friday to see a man hanged.'—Another whimsical anecdote is related of the Duke of Clarence, afterwards William IV., who, riding in the Park on the road between Teddington and Hampton-wick, was overtaken by a butcher's boy on horseback, with a tray of meat under his arm. 'Nice pony that of yours, old gentleman,' said he. 'I'll trot you a couple of miles for a pot of beer.' The Duke respectfully declined the match; and the lad, as he struck the heels of his boots in his horse's side, exclaimed, with a look of contempt: 'I thought you was only a muff.'

In fact, from a king to the peasant, or a bishop to an errand-boy, all would appear to be occasionally 'tarred,' as it were, with the same brush. It is so pleasant, on the whole, to be able to speak one's own mind; and the absurdity often, if not always, lies in the sudden utterance of our thoughts. Two sons of an English aristocrat were remarkable for hastiness of temper, which on certain occasions broke out into very indiscreet expressions. During a quarrel, and in the height of passion, one said to the other: 'You are the greatest ass in the world.'—'Come, come, my lads,' said their highly incensed father; 'you forget that I am present.'

Ap[ro]pos to our subject, abundant materials

might possibly be found in other countries besides our own, and such as would amply furnish us with food for reflection as well as laughter. One instance may suffice. On one occasion, a coloured preacher in New York, who was very popular, and who had overflowing audiences, was suddenly called upon to arrange his congregation a little more to the satisfaction of those in the rear. He did so at once by saying: 'My dear bretheren, for mutual convenience, de fore-part ob de church will please accommodate themselves and others by sitting down; so de hind-part ob de church can see de fore-part; for de hind-part can't see de fore-part ef de fore-part persist in stanin' before de hind-part, to de utter exclusion ob de hind-part by de fore-part.' Nothing could be more lucid.

One more example, and we conclude these brief sketches. In a dancing-saloon one night, a sailor was asked by a messmate to explain to him in a few words and as quick as possible, the third figure of the quadrille. His description was as follows: 'You first of all heave ahead,' said he, 'and pass your adversary's yard-arms; then in a jiffy regain your berth on the other tack in the same kind of order; slip along sharp and take your station with your partner in line; back and fill, and then fall on your heel, and bring up with your craft. She then manœuvres ahead off alongside of you; then make sail in company with her until nearly astern of the other line; make a stern board; cast her off to shift for herself; regain your place out of the mêlée in the best manner you can, and let go your anchor.'

I think we may take it for granted that not a word of this nautical programme was lost upon Jack's intimate friend. On the other hand, it is equally as certain that if a landsman had received these instructions, he would have been as wise as ever. Due justice, however, must be given to Jack, who spoke evidently to the best of his ability, and on the spur of the moment.

THE MONTH.

SCIENCE AND ARTS.

IF any proof were needed of the enterprise exhibited by newspaper proprietors in their thirst for new and trustworthy intelligence, it would be sufficient to point to expeditions such as Stanley's search for Livingstone, and the recent unfortunate expedition to the 'Frozen Deep,' both of which enterprises must be placed to the credit of the *New York Herald*. And here at home, editors are by no means backward in their endeavours to get the most reliable news. Special correspondents penetrate far into any country to which the eyes of the world may for the time be directed, bearing with them that keen faculty of observation which gives value to their work. To the names of note in this department must now be added that of Mr O'Donovan, the Merv special correspondent of the *Daily News*. Hitherto, we have looked upon Merv as an important city, upon which Russia has long cast a covetous eye, because its possession

would render easy an advance upon Herat, otherwise known as 'the gate of India.' Mr O'Donovan told the Royal Geographical Society the other night that 'there was no such city as Merv at present; Merv was merely a geographical expression.' There were 'some wretched hovels, sheep-skin-clothed people, and half-starved cattle feeding in a bog.' This description is certainly very different from our usual ideas of an Eastern city, with its gilded domes and fairy-like minarets sparkling in the haze of a golden sunset. Mr O'Donovan had a great deal to say about Merv and its surroundings; and we shall look forward with interest to the publication of his promised book, giving details of his strange experiences in the land of the Turcomans.

Another intrepid traveller to whom the Royal Geographical Society has lately given audience is M. Gorloff, a young Frenchman, hardly known to Englishmen except by report. Accompanied by only two companions—Arabs—he has had the hardihood to undertake a six months' journey into Africa. He says that he did not penetrate far into the Sahara, but claims to be the first traveller who has ventured there with such a limited escort. It seems strange to hear that frost was experienced every night, and that the traveller and his two guides lost their way in a snow-storm, and were in some danger of being frozen to death. Many people in France, says M. Gorloff, believe the Sahara to be a rich country where fortunes can be easily made; but let them travel in it, and they will speedily change their opinions.

A very curious and useful work, which has met with high commendation from the French Academy, has just been completed by M. Civiale. It consists of a photographic map of the Alps, constructed in the following manner. By preliminary observation, M. Civiale saw the possibility of fixing upon forty-one central stations from which all-round views could be obtained of the mass of the Alps and its diverging chains. Taking his photographic apparatus with him to these various stations, lying at a height of eight thousand feet, and in some cases ten thousand feet, he was able to secure photographs from every point, to be afterwards joined so as to make a complete panorama. In addition to these, he busied himself with the details of the landscape. Snow-limits, natural geological sections, glaciers with their crevasses and moraines, all came in as subjects for his camera. These photographic records of the country cannot fail to be interesting from a technical as well as a popular point of view. We trust that they will be secured by some permanent process, so that in after-years they will not present that yellow, sickly appearance, with which we are only, alas, too familiar.

The familiar heading 'Colliery Explosion' continually calls to mind the risks attending the modern system of coal-mining. The poor miner

himself is perhaps too often credited with the authorship of the calamity by opening his safety-lamp, and so setting fire to the surrounding gas. But there are means by which the initial flame can be given without any culpable negligence of the worker. The system of blasting with gunpowder is open to this fatal objection—the flash of the powder is a flame which will quickly communicate itself to the surrounding atmosphere, and cause general havoc and death. To obviate this danger, a new form of cartridge has been designed, the explosion of which is accompanied by no flame, and which needs neither spark nor fire to set it in action.

This new method of coal-blasting has been in use for some time at the Shipley Collieries, Derbyshire, and has been patented by Messrs Smith and Moore. Instead of gunpowder or dynamite, the cartridge is charged with lime. This lime is in a highly caustic state, and is compressed by hydraulic power—forty tons to the square inch—into cartridges of two-and-a-half inches diameter. Attached to the cartridge is a flexible tube, the other end of which is connected with a force-pump; and by this means the charge is fired, or rather we should say watered. We all know that the action of water upon lime is to give rise to much heat, and to expand and to crack the lime in every direction. It is these properties which are taken advantage of in this clever invention. The pressure exerted by the confined steam from the lime forces out the coal in which it is imbedded; while the after-expansion of the material completes the work, giving all the advantages of ordinary blasting without its terrible risks. The explosion—if explosion it can be called—is accompanied by no concussion, and neither liberates huge volumes of gas nor raises clouds of fine dust—in themselves sources of danger; and no sound-wave, to carry a disturbing element through the workings, is produced. At the late meeting of the Iron and Steel Institute, where a paper on this subject formed perhaps the most interesting feature of the proceedings, two iron pipes were exhibited, to give an idea of the power exerted by this new form of cartridge. These pipes were shattered, although one of them had previously been tested to a pressure of nine hundred and fifty-three pounds on the square inch. We sincerely trust that this new means of blasting will be found as efficient as it promises to be, not only on account of the miners, but also to do away with that familiarity with dynamite which breeds a contempt for its awful power.

It will perhaps be remembered that shortly after the Tay Bridge calamity, an attempt at sub-aqueous photography was made, in order to get, if possible, a view of the wreck of bridge and train as they lay thirty feet below the surface of the water. Mr W. D. Valentine, to whose hands these experiments were intrusted, has recently sent an interesting account of them

to the *Photographic News*. A very bright day was chosen for the trial; and a diver, after being properly instructed as to what to do, was sent down with the camera. This camera was of no ordinary kind; for it had to be lowered with a powerful crane, and with the addition of ten hundredweight to induce it to sink. With the quickest lens, by the most rapid method of photography, and with an exposure of twenty minutes, Mr Valentine failed to get even the ghost of an image on his plate. This showed that the actinic rays of light failed to penetrate through the thirty feet of water which separated the camera from its accustomed element. Apparently, there was no want of light, for the diver stated that he could easily see for thirty feet in front of him; but it is evident that the light did not comprise those rays upon which the efficiency of a photographic surface depends.

Some curious experiments as to the action of the brain during sleep have lately been made upon himself by M. Delauney. Working on the known fact that the action of the brain causes a rise of temperature in the cranium, the experimenter found that the converse of this was true, and that he was able, by covering his forehead with wadding, to stimulate the action of the brain. Dreams which are naturally illogical and absurd, became under this treatment quite rational and intelligent. He also found that their character was much modified by the position assumed during sleep, whereby the blood might be made to flow towards particular parts of the body, and thus increase their nutrition and functional activity. These experiments have but slight value. Those whose lives are spent in hard work, either physical or mental, will prefer their dreams to be as illogical and vague as possible, so that the poor brain may not go on working while the body is at rest.

The *Phylloxera vastatrix*—the dread destroyer of the grape-vine—has, like any other deep-dyed criminals, had its portrait taken for circulation over the civilised globe. Messrs Hatchette & Co. have issued two plates which cannot fail to be of great use in the future in showing those happy possessors of vineyards who do not already know the personal appearance of the enemy, what they are to look for. The first plate represents the insect in its various stages from the egg to its winged and adult form. The second plate deals with its destructive work upon the vine. The root and branches of a healthy vine are here shown side by side with the root and branches of one upon which the *Phylloxera* has operated; and thus the whole progress of the pest from its birth to its destructive mission, is admirably depicted.

We are glad to notice that at the late meeting of the Royal Agricultural Society, honourable mention was made of the name of Miss Ormerod, whose labours with regard to insect pests and the best way of dealing with them have been already adverted to in these pages.

The question of obtaining pure and wholesome food is of such great importance, that all right-minded people naturally feel glad when adulteration is detected, and its authors punished. But in common fairness to the trader, the methods of analysis should be beyond suspicion; and when a public officer states that a particular sample

of food contains so much per cent. of foreign material, we should be quite sure that he has the means for ascertaining that fact. We are led to these remarks from some unfortunate discrepancies which have been made public in certain recent analyses of coffee. A sample of coffee was purposely adulterated with ten per cent. of chicory, and distributed in seven portions to as many different analysts, the Somerset House authorities being among the number. The results were as follow: Analyst A certified the mixture to contain only seven per cent. of chicory; B made a similar report; C said two-and-a-half per cent.; D certified to from five to ten per cent.; E found ten per cent. upwards; F discovered sixteen per cent.; while G determined that the sample consisted of genuine coffee. These figures are, to say the least, unsatisfactory. In the first place, they arouse the unpleasant suspicion that many innocent people may have been punished for adulterations which never existed; and in the second, that adulterations may frequently, for want of proper methods of analysis, be allowed to remain undetected, and thus guilty persons escape.

The newspapers are nowadays somewhat too full of electricity. We do not allude to their notice of new inventions, or new applications of old discoveries, which in these times of rapid progress in electrical science cannot fail to be of interest. We allude rather to the notices of public Companies, which, like so many moths, have suddenly appeared hovering round the brilliant light. We fear that, also like moths, many of them are destined to singe their wings, if not to come to still more serious grief. People who venture their money in electric-lighting shares should be in a position to afford to lose it. We do not mean to say that they must necessarily lose, but we wish to point out that the investment is a purely speculative one. The electric light has only been tried experimentally, and cannot, therefore, be looked upon as a sound investment, from which, as a matter of course, an income will be forthcoming. Putting aside the doubtful value of many of the patents—doubtful, we mean, from their close family resemblance—we may assume that there may be something better to come which may cast existing contrivances into the shade. We believe that electricity will give us the light of the future. But before it becomes general enough to represent a basis of sound investment, existing patents must pass through a long period of natural selection, during which many must disappear.

A novel application of the electric current is detailed in *La Nature*. At some large linen-bleaching works at Le Breuil-en-Ange, the linen spread out in the meadows is collected by means of a dynamo-machine. The desirability of having some kind of railway truck-system for the collection of the linen was long ago admitted; but the smoke and dirt of a steam-engine precluded its employment. The dynamo-machine actuated by the electric current has no such disadvantages, and for the past three months it has been employed with the most satisfactory results. A small railway crosses the ends of the lines of cloth, and the dynamo-machine is so arranged that it can operate upon the wheels of the vehicle on which it is mounted, or can be employed for reeling up the cloth into an attached truck. In

this way one man can gather up a quantity of the material in half an hour, which, under ordinary circumstances would occupy an entire day. The machine is worked by Faure accumulators.

It is said that ivory is becoming so scarce that it will soon be regarded as a luxury to be afforded only by the few. As a matter of fact, about half the quantity has reached the English market, compared with the amount received up to the same time last year; so that if we wish to see our pianoforte keys and our knife-handles maintain their wonted appearance, we shall have to fall back upon some ivory-like composition, instead of employing the real article. A few years back, such a compound was introduced under the name of Celluloid, and a very good imitation of ivory it presented. It was manufactured by treating paper with nitric and sulphuric acids, so as to convert it into nitro-cellulose. This compound was afterwards pulped, and passed through a rolling-press with a certain quantity of camphor. The chief objection to the substance was its great inflammability; but we learn that a means of obviating this has lately been devised. Celluloid has an advantage over ivory in that it can be moulded so as to take the most delicate impression.

The question of the possibility of obtaining heat from solar radiation sufficient to boil water, and so actuate a steam-engine, is one which has of late years engaged the attention of scientific men and Societies. A French government Commission has lately been carrying out some experiments with apparatus, consisting of a large concave mirror with a blackened boiler in its focus. The steam was condensed as it was given off from the boiler; and the weight of distilled water thus obtained indicated the amount of heat utilised. From these experiments, as we have before hinted in these pages, it would seem that the sun is far too fickle a source from which to obtain heat, except in some few countries where the steam-engine is as yet unknown, and not wanted.

At the Royal United Service Institution, an interesting paper was lately read by Colonel Fosbery, V.C., on the subject of Magazine guns, by which is meant those small-arms which, like the Winchester repeating-rifle, can be fired over and over again by means of a collection of cartridges in the stock, or in some other receptacle. Colonel Fosbery held that in modern warfare the soldier required, for special occasions and for brief intervals, to be endowed with a higher power of defence and attack than any system of single-loader would afford. He brought forward a 'magazine' of his own invention, which can readily be attached as a cartridge-feeder to the ordinary Henry-Martini rifle.

Submarine torpedo-boats of novel but simple construction have lately been built for the Russian government. They are about twenty feet long, so that a man-of-war could carry several of them without inconvenience. The shape of a cigar, the boat has a glass dome projecting from it, by means of which the officer in charge can direct its course. The screw-propeller is worked by the feet of four men, and the boat is lowered or raised by shifting

weights on a sliding bar from stem to stern. Each boat is to carry torpedoes, which can be attached to a ship's bottom by a pneumatic contrivance. After such attachment it will be the duty of the submarine boat to retire to a safe distance before making the electrical contact which will cause the explosion. The submarine vessel will carry a supply of compressed air or oxygen; and the carbonic acid from the men's lungs will be absorbed by caustic soda, as in the diving apparatus of Mr Fleuss.

Riveting by hydraulic machinery is now being largely introduced into the ship-building yards on the Clyde. The verdict of a special Committee of surveyors on the subject, after due inspection, was, that these machines 'thoroughly fill the holes and counter-sinks, and produce a smoother and better clench than can usually be obtained by hand-labour.' The saving of time and outlay, also, over hand-labour is very great.

The subject of the salmon-disease forms the most interesting portion of the recently published annual Report of the Inspectors of Salmon Fisheries for England and Wales. Unfortunately, much that is indefinite still surrounds the subject. The experience of practical fishermen and the researches of accomplished scientists have equally failed either to detect a cause or to suggest a remedy for the epidemic. The Inspectors express themselves as confident that the disease, which first attracted attention in 1877, had existed, at least in a sporadic form, for many years. The great difficulty is to determine what are the influences, climatic or otherwise, which cause the disease to assume the form of a widespread epidemic affecting thousands of fish, and attacking both kelts and clean fish. Professor Huxley has expressed the opinion that, whilst the primary cause of the disease is the fungus *Saprolegnia ferax*, there must be other and secondary causes acting in combination, and that information is still required as to these. As an instance of the destructive nature of this disease, it may be mentioned that from the Tweed alone, between November of last year and May of this year, no fewer than ten thousand six hundred diseased salmon, grilse, and sea-trout were taken out of the river and buried.

BOOK GOSSIP.

THE extension of science-knowledge in popular forms, with the consequent greater demand for scientific appliances, has led to marked improvements in the production of the necessary apparatus, accompanied by a reduction in price so great as to place such instruments within the reach of many who would otherwise be unable to procure them. The most popular and most generally useful of all these instruments is the microscope, without which the student of biology, and of animal and vegetable morphology, would be unable to carry on his researches beyond the merest preliminary stages. But along with the possession of the instrument itself, there is required some knowledge and skill in the use of the instrument; and many works have been published with the object of conveying to students

the necessary instructions. To this list is now added a work, entitled, *Practical Microscopy*, by Mr George E. Davis, F.R.M.S. (London: David Bogue). It is illustrated with over two hundred and fifty woodcuts; and the directions in regard to the microscope and its work are so full and ample, that the book can scarcely fail to be of value both to those who already possess microscopes, and to those who may require guidance as to the purchase of one. One advantage which this book has over some of its predecessors in the same department, is, that it is comparatively inexpensive, and is thus more easily acquired.

**

At this season of the year, when prospective tourists are eager to hear or to tell of something new, an appropriate addition is made to our guide-book literature by the publication of *The Handbook to the Rivers and Broads of Norfolk and Suffolk*, by Mr G. Christopher Davies (London: Jarrold and Sons). These rivers and 'broads' form the distinguishing and characteristic feature of the modern scenery of East Anglia; its marshes and fens, linked to each other by gleaming brook and river, alone breaking the monotony of its flat and otherwise unattractive landscape. 'In a journey through it by rail,' says Mr Davies, 'you see nothing but its flatness; walk along its roads, you see the dulllest side of it; but take to its water-highways, and the glamour of it steals over you, if there is aught of the love of nature, the angler, or the artist in you. Houses are few and far between; oftentimes within the circle of your sight there is neither house nor man visible. A gray church-tower, a windmill, or the dark-brown sail of a wherry in the distance, breaks the sense of utter loneliness; but the scene is wild enough to enchain the imagination of many. Long miles of sinuous gleaming river; marshes gay with innumerable flowering-plants; wide sheets of water bordered with swaying reeds; yachts or wherries, boats, fish, fowl, rare birds and plants, and exquisite little bits to paint and sketch: these are the elements out of which a pleasant holiday may be made.' The book is accompanied with a good map of the district.

**

We are introduced to a very different type of scenery by a little official guide-book, entitled, *Summer Tours in Scotland: Glasgow to the Highlands*, issued in connection with Mr David MacBrayne's royal mail-steamers (119 Hope Street, Glasgow). These beautiful vessels, the *Columba*, *Iona*, &c., were formerly better known in connection with the name of Mr MacBrayne's partner, the late Mr Hutcheson; and have long been famous for their comfort, their speed, and all the other qualities that render travel by water pleasant and agreeable. This little book will be of considerable use to tourists, as they have here set down a series of routes, all more or less different, which can be accomplished within one week—such as, on the first day, from Glasgow to Oban; second day, from Oban to Staffa and Iona, and back; third day, from Oban to Ballachulish (including Glencoe), and proceed to Banavie; fourth day, Banavie to Inverness, *via* Caledonian Canal;

fifth day, Inverness to Oban, by Canal; sixth day, from Oban to Glasgow. This is but one specimen of the many circular routes here arranged, other trips of the same number of days including visits to Portree in Skye, to Boisdale in South Uist, to Lochmaddy in North Uist, and to Tarbert and Stornoway in the far-distant Lewis. In this way the tourist may have a view of some of the finest water and mountain scenery with the least possible expenditure of time; visiting places of historical renown, such as Iona; of romantic danger, such as Corrieveckan; of natural beauty, such as the columned cave of Staffa; or of wild and weird interest, such as the dark mountains and sequestered lochs of the storm-vexed Hebrides. It is the magnificent scenery which Scott has painted for us in his *Lord of the Isles*, and which has since been made familiar to modern readers by pages of graphic and beautiful description in the novels of William Black. No better preparation for the journey can be made than the perusal of Mr MacBrayne's handbook, which, in addition to the official information to which we have referred, contains about a hundred pages of condensed and well-written notes on the historical and other associations of interest belonging to the places seen or visited in the course of the different routes, together with a map of the routes.

OCCASIONAL NOTES.

SOME EFFECTS OF THE VIBRATION OF TELEGRAPH-WIRES.

The humming sound which is produced by the vibration of telegraph-wires is said to have somewhat peculiar effects upon certain creatures. The woodpecker, for instance, feeds on larvæ and insects which it finds under the bark and in the core of decayed trees, and to get at which it perforates the bark or covering with its powerful bill. It has been suggested that it detects the presence of insects in decayed trees by the delicacy of its hearing, which directs it to where the insects or worms are at work within the tree. In certain cases, however, the little bird has been deceived by the humming sound of the telegraph-wires; and at the recent Crystal Palace Electric Exhibition, as many of our readers doubtless remember, there was shown a piece of wood, cut from a perfectly sound post, perforated with a hole three-and-a-half inches in diameter, and which hole had been drilled out by the woodpecker under the impression that there must, from the sounds which it heard, be insects somewhere in the interior of the post. Similar borings are said to be frequently found in the pine-woods of Norway where this bird is found; the holes being as a rule made near the top of the post.

Bears are said to be frequently cheated in a similar manner. These animals are, as is well known, extremely fond of honey; and their vicinity to a store of it is usually discovered by the humming sounds which the honey-makers emit. The sound of the telegraphic wires is not unlike the sound of a swarm of bees; and when the sound reaches his ears, the bear at once begins to look about for business. Following the delusive sound, he finds that at the foot of the telegraph-post it becomes louder than ever; and as he does

not find the expected beehive, he very naturally thinks it must be under the heap of stones which are sometimes used to support the post. These stones he at once begins to scatter about in all directions; but though the humming is as distinct as ever, there is no trace of the honey-store to be found, and the hungry bear has only his labour for his pains. At first, this scattering of the stones was a puzzle to the officials, until the finding of the marks of bears' claws in the posts led to the discovery of the real cause.

It is alleged that in certain districts formerly infested by wolves, the introduction of the telegraph-wire has had the effect of frightening these terrible pests away. But the evidence for this is not well substantiated, other causes being in operation in those districts which might be conceived to have a similar restraining effect upon the wolves.

THE VINE DISEASE—SUGGESTED REMEDY.

The damage which the vineyards of France have sustained from the ravages of the *Phylloxera*, has led to many experiments being made for the purpose of getting rid of this most troublesome and destructive insect. A suggestion on the subject comes to us from China, which has the appearance of being feasible. It is made by Dr Macgowan of Shanghai, and is derived from the practice of the Chinese, who, in the matter of orange-culture, employ a certain species of ants as insecticides. In many parts of the province of Canton, the land is devoted to the cultivation of orange-trees, which being subject to devastation from insects, require to be protected in a peculiar manner, namely, by importing ants from the neighbouring hills for the destruction of the dreaded parasites. The orangeries themselves supply ants which prey upon the enemy of the orange, but not in sufficient numbers; and resort is had to hill-people, who throughout the summer and winter find the ant-nests suspended from various kinds of trees. There are two varieties of these ants, red and yellow; and their nests resemble cotton bags. The 'orange ant-breeders,' as these hill-people are termed, are provided with pig or goat bladders which are baited inside with lard; and the orifices of these being applied to the entrance of the nests, the ants are induced to enter the bags. They thus become a marketable commodity at the orangeries. The orange-trees are thereafter colonised by depositing the ants on their upper branches; and to enable them to pass from tree to tree, all the trees of an orchard are connected by bamboo rods.

Dr Macgowan asks if the orange is the only plant thus susceptible to protection from parasitic pests; and adds his opinion that the particular species of ants above referred to are not the only species capable of being utilised as insect-killers. He also suggests that entomologists and agriculturists would do well to institute experiments with a view to further discovery in this line of research. It might even be possible for the Société d'Acclimatation of France to import a number of the ants used in Chinese orange-culture, and by practical tests in the vine-fields to ascertain whether or not they would be serviceable in checking the destructive work of the *Phylloxera*, by reducing the numbers of the latter.

A SUMMER'S DAY.

It was a lovely day, a summer's day—
A day when Nature seemed to sleep in peace,
And all around was peace. The feathered songsters
Warbled their hymns of praise and sweet content
To their Creator; while the gentle breeze
Dreamingly stirring in the tall tree-tops,
Sighing a sigh of peace in the long grass,
Bending with stately grace the golden corn,
Murmuring sweet nothings to the dainty rye,
Joined in the chorus ever and anon,
Then trembled into silence.

Suddenly,
The spell is rudely snapt; for, rushing on
With sharp, shrill scream, and loudly clanging bell,
We see the fiery monster with its freight,
Immense, of living souls. On, on it speeds
Until the last pale cloud of steam departs,
And once again the silence reigns supreme.
The sun, the glorious sun, is shining bright,
High in the heavens, and tinting all around
With his own golden glory; and afar,
Glinting like diamonds, radiant in the light,
Lies the clear sea, so calm, in such repose
That not a ripple stirs it. All is peace.

On rustic seat beneath yon spreading tree,
Two lovers sit in their unconscious bliss.
Surely the peace has entered their young hearts
On this glad summer day. The man is one—
True, tender, loyal—such as women love;
And she, a fair young girl, in silent joy
And rosy happiness, doth list to hear
That which perchance her heart had known before.
Breathing in earnest words his tale of love,
He bends his head to hear her answering voice,
Then looks up satisfied. Her heart is won.

'Tis sad to know such peace may change to storms,
To know the sun must sometimes be obscured,
To know the tuneful birds will cease to sing,
To know that blessed love may change to hate.
Yet while the summer sun, and love, and peace,
Are each and all our own, we will be glad,
Lifting a thankful heart to God who gives.
And when the storm shall come—as come it may—
May He to whom we turn in time of grief
Say to our sorrowing spirits, 'Peace! be still!'

N. J. H.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. To insure return in case of ineligibility, postage stamps should accompany every manuscript.
- 3d. MANUSCRIPTS should bear the author's full *Christian* name, surname, and address, legibly written; and should be written on white (not blue) paper, and on one side of the leaf only.
- 4th. Poetical offerings should invariably be accompanied by a stamped and directed envelope.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

DISEASE GERMS.

THE composition of the atmosphere has been regarded for years as a subject which chemists have long since decided with an exactness which can scarcely be improved upon. Text-books inform us that the air we breathe is in the main a mixture of the well-known gases oxygen and nitrogen, together with a small but uniform proportion of carbonic acid gas.

Such is, indeed, the composition of pure air; but life is so widely diffused over the globe that except in high Alpine regions, the atmosphere everywhere contains impurities of a more or less detrimental character. Our fires and lights pour into the air innumerable particles of solid carbon, and vapours of petroleum, creosote, and sulphurous acid. Our bakers send into it annually some millions of gallons of alcohol from the fermenting process connected with bread-making; dead and decaying animals and vegetables supply their quota of gaseous materials; while the industries which bring us much of our wealth, diffuse throughout the air numerous small particles of starch, wool, cotton, brickdust, arsenic, and other substances. But these impurities, considerable though they may appear, are really of minor importance. The winds and rains, which we vaguely speak of as 'clearing the air,' carry off most of the suspended particles and wash the soluble gases into the soil. There is another class of atmospheric impurities, however, so universal in their diffusion, and of such vast importance in their effects, that a thorough acquaintance with them will be fraught with incalculable benefit to mankind. These we are familiar with as the motes which dance in the sunbeams, the floating matters in the air, now known to consist, in part at least, of Disease Germs.

Nowadays, people are inclined to scoff at the aims of the old philosophers; but we ought to remember how much modern science owes to these early investigators. The astrologers may be held as mistaken in supposing any connection

to exist between the motions of a star and the life of a human being; yet we are indebted to them for a great deal of our earlier astronomical knowledge. The alchemists who spent their lives in the search for the philosopher's stone, and the mechanicians who devoted years to their quest of perpetual motion, did not spend their lives altogether in vain; for in many departments of chemistry and mechanics, we are now reaping the fruits of their labours. Hence, also, in more recent times the search after the beginnings of life—the dream of spontaneous generation—while fruitless in its direct endeavour, has already conferred upon us blessings great and manifold.

In 1837, Schwann, a Berlin scientist, made the important announcement, that when a decoction of meat is effectually screened from the atmosphere, putrefaction never sets in. Practically, the same principle is the secret of success in the modern trade of preserving meat in tin cans by exclusion of the air. Twenty-two years after Schwann's announcement, a book appeared from the pen of an eminent Frenchman, F. A. Pouchet, giving the results of numerous experiments altogether opposed to Schwann's conclusions. Deeply interested in the discussion, Pasteur, a young French chemist, determined to take the matter in hand, and commenced a series of experiments which have yielded the most interesting and valuable results. Starting with the air, he found that many of the floating particles are not mere specks of inanimate dust, but organised bodies containing the germs of life. Some of these he introduced into animal and vegetable infusions, which he had previously boiled, to destroy any living organisms which might be present in the liquid, the result being that he soon obtained an abundance of microscopic life, and in a short time the infusions invariably became putrid. On the other hand, when similar infusions were thoroughly protected from the entrance of these atmospheric particles, not the slightest indication of life appeared in the liquid, even after months and years; but when the smallest drop of any decomposing liquid was

added, or ordinary air obtained access to the clear infusions, life began to manifest itself, and soon the water teemed with myriads of microscopic organisms.

In this way Pasteur established the fact, that just as oaks grow from acorns, or thistles from thistle-seed, so these minute living organisms are produced according to the common law of generation, springing from previously existing germs or seeds, but never growing spontaneously, or giving the slightest indication that life ever proceeds from anything which has not itself owed its existence to some previous life. Since then, innumerable experiments conducted by our illustrious countryman Professor Tyndall, have fully corroborated Pasteur's researches.

Now, let us glance at several widely separated departments of every-day life, and investigate a few facts which have apparently but little connection with each other.

When milk is long exposed to the air, it becomes sour or putrid; and if we place a drop of sour milk under the microscope, we shall find a number of small organisms linked together like beads upon a string. These are the cause of the sourness; for they have decomposed the sugar of the milk into lactic acid, the substance which imparts the sour taste. The organism which produces this change is similar in nature and appearance to the well-known yeast-plant, which changes sugar into alcohol. Taking, now, a drop of putrid milk, we find it exhibits a different appearance from that which is simply sour; for it swarms with rapidly moving specks, which receive the common name of bacteria. These organisms are very minute, much smaller than those producing sourness, and they are in every case the active agents in producing putrefaction. Expose milk, or meat, or vegetables to the air, and in a short time they will swarm with bacteria. Keep the air from them, and not one of these organisms will be found.

Let us now turn our thoughts for a moment to France. About twenty years ago, a disastrous silkworm disease reduced the produce of cocoons from fifty-two million pounds in 1853 to eight million pounds in 1865, involving a loss of some hundred million francs. Examined under the microscope, the blood of the diseased silkworm was found to contain innumerable animated vibratory corpuscles; the silk-bag was filled with these, instead of with the clear material from which the silk is spun; and these organisms were present in still larger size in the mature moths. Starting with these facts, M. Pasteur attacked the problem, and by securing healthy eggs produced by healthy moths, and by carefully guarding against contagion, restored to France her valuable silk husbandry. But while the practical results he accomplished attest the accuracy of his views and predictions, the observations which led to these results are more immediately interesting. From moths untainted by disease he obtained healthy worms, and on these he conducted his experiments. Taking a diseased worm, and rubbing it up in water, he mixed a little with the food of healthy silkworms; the result being that all the latter became infected, and finally died. A single meal was sufficient to poison them, and the progress of the disease was always attended by

a gradual increase in the number of the above animalcular corpuscles found in their blood. During these investigations, M. Pasteur proved that the disease was spread by the worms scratching each other with their claws, and thus introducing the disease germs into the wound. He found too, that the refuse of diseased worms contained infectious organisms, and this adhering to the mulberry leaves, spread infection among other worms feeding on these leaves.

The same distinguished chemist had his attention drawn to the losses frequently sustained by the wine-growers and vinegar-makers of France. The wines would often become unaccountably acid or bitter, and millions of money were in this way lost to his countrymen. Setting to work in his usual thorough and scientific fashion, he soon discovered that the wine disease was due to the presence of numerous microscopic organisms on the skin of the grape, which, finding their way into the wine, set up putrefactive changes which entirely altered the character of the liquor. Having ascertained the cause, his next task was to find a remedy; and before long he made the discovery, that by simply heating the juice of the grape to a certain temperature, these putrefactive germs were all destroyed, without in any way damaging the quality of the wine. All three diseases, the wine, the vinegar, and the silk, he traced to their living causes; and eventually discovered remedies for each by determining the conditions which prove fatal to these organisms, or which prevent their development.

Passing now into the surgical ward of an English hospital, let us examine an amputated limb which is not healing well. It has begun to putrefy. Taking a little of the matter, we examine it under the microscope, and find it swarming with minute organisms similar to those which we observed in putrid milk. This wound has been exposed to the air. In the next room is a somewhat similar amputation, except that the wound was dressed in such a way as to prevent any of the so-called dust of the air from coming in contact with it. A spray of dilute carbolic acid was kept playing over it all the time it was being operated upon, and now it is healing beautifully, for no living germs have obtained access to it.

A word or two about an animal disease known as splenic fever will bring us to the well-known zymotic diseases which carry off so many human beings. As early as 1850 it was observed that the blood of animals which had died from splenic fever teemed with microscopic organisms resembling minute transparent rods; and it has been placed beyond all doubt that this fever is due to the growth and development of these minute organisms. Placed under favourable conditions, the rods grow till they often become a hundred times their original length. After a time, little dots appear in them, which finally grow to minute egg-shaped bodies, presenting an appearance somewhat like a long row of seeds in a pod. By-and-by the pod—as we may call it—goes to pieces, and the seeds or spores are let loose. Many experiments have been made with both rods and spores. Guinea-pigs, rabbits, and mice were inoculated with the blood of diseased animals containing the rods,

the result being that within twenty or thirty hours they invariably died of splenic fever. By drying the blood which contained only the rods, it was found that it did not retain its infectious properties longer than about a month; but blood containing the developed spores, dried and reduced to dust, even after being kept four years, proved as deadly as at first.

In 1868, M. Chauveau made some interesting discoveries concerning the infectious matter in cow-pox, sheep-pox, small-pox, hydrophobia, glanders, and syphilis. Taking some of the matter, he found that it consisted of a fluid in which were numerous minute granular particles, some of them so minute as to pass through the finest filters. When diluted with water, the larger particles subsided, the finer granules, however, remaining suspended in the water, and the liquid still retaining its infectious properties; but by diffusion in distilled water, these minute particles were completely separated, and the liquid then proved harmless. It was thus shown that the infection was communicated by these minute organised particles, and that even a single one of these possesses such inconceivable fecundity that it will produce quite as powerful effects as if a large quantity of concentrated matter had been introduced into the system. Sufficient evidence has thus been obtained to prove that many diseases are propagated by minute organisms; and it is now a well-ascertained fact that scarlatina, diphtheria, measles, typhus and typhoid fevers are spread in the same fashion.

Let us then briefly sum up what is at present known about the Germ Theory of disease. Experiments having shown that no life is known to spring from inanimate matter, we may reasonably conclude that just as wheat does not grow except from seed, so no disease occurs without some disease germ to produce it. Then, again, we may take it for certain that each disease is due to the development of a particular kind of germ. If we plant small-pox germs, we do not reap a crop of scarlatina or measles; but just as wheat springs from wheat, each disease has its own distinctive germs. Each comes from a parent stock, and has existed somewhere previously. It is true that complications occur, several diseases running their course at one time, or one after the other; but however uncommon, none of them are new. After a forest is cut down, a new variety of trees may spring up; but nobody supposes them to have grown spontaneously; the seeds existed there before, and their growth was due to the occurrence of conditions favourable to their development. So the disease germs which are always floating about may frequently be introduced into our bodies; but it is only when they meet with suitable conditions that they take root and produce disease. Under ordinary circumstances, these germs, though nearly always present, are comparatively few in number, and in an extremely dry and indurated state. Thus, they may frequently enter our bodies without meeting with the conditions essential to their growth; for experiments have shown that it is very difficult to moisten them, and till they are moistened they do not begin to develop. In a healthy system they remain inactive. But anything

tending to weaken or impair the bodily organs furnishes favourable conditions, and thus epidemics almost always originate and are most fatal in those quarters of our great cities where dirt, squalor, and foul air render sound health almost an impossibility. Thus, too, armies suddenly transferred from the regularity and comparative comfort of barrack-life to the dangers, toil, and exposure of the battlefield and the trenches, are often attacked by epidemics. Having once got a beginning, epidemics rapidly spread. The germs are then sent into the air in great numbers and in a moist state; and the probabilities of their entering, and of their establishing themselves even in healthy bodies, are vastly increased. For the same reasons, one disease not unfrequently follows another. The latter is commonly said to have 'changed' into the former; but probably the two are entirely distinct, the second being simply due to the weakening of the system.

Another widespread belief is that foul smells give rise to disease. It is not, strictly speaking, the foul gases, but the germs present in them, that produce the diseases. The effluvia, however, are themselves injurious to health, while they are indications of a state of matters much more dangerous; and it is never sufficient to destroy evil odours without searching out and removing the causes that produce them.

Climate and the weather have also much influence on the vitality of these germs. Cold is a preventive against some diseases, heat against others. But we have still much to learn regarding their behaviour under varying conditions. Tyndall found that sunlight greatly retarded and sometimes entirely prevented putrefaction; while dirt is always favourable to the growth and development of the germs. Sunshine and cleanliness are undoubtedly the best and cheapest preventives against disease.

The method in which these diseases are spread demonstrates the necessity and value of thorough disinfection. A person suffering from one of these zymotic diseases is affected, say, in the throat; well, every time he spits or coughs, or perhaps with every breath, he discharges from his throat a great number of the organisms whose development has produced the disease. These may pass directly into the body of some one near, and thus set up disease in a second person, and so on; or falling on the ground, or settling upon clothes or carpets, they may dry up like particles of dust, and be shaken off the clothes, perhaps many months after, or be carried by the wind to places at a considerable distance. In either case, still retaining all their virulence, they will give rise to a fresh outbreak of disease whenever they meet with favourable conditions. Thorough fumigation or other method of destroying their vitality, largely or entirely prevents this.

In the case of diseases such as typhoid, which attack the stomach, disease germs are removed along with the excreta; and if, as is often the case, the drainage of the town flows into a river, and that river is used in some after-portion of its course as the water-supply of any town near its banks, there is great danger of disease being communicated by the water which we drink; for however well it may be purified and filtered, we have no

guarantee that it will contain none of these germs, which we have seen are so small that they pass through the finest filters. It is in this way that almost all the great cholera and typhoid epidemics have spread in London and other towns. That such a disgusting system should be permitted to exist, is a disgrace to a wealthy and enlightened nation.

How these organisms may be destroyed in cases of disease without injury to the person or animal affected, is the great problem which awaits solution. Wine-making, brewing, silkworm rearing, and surgery, have already shown the immense importance and practical value of a knowledge of this subject. Nowadays, in surgical operations every part of the flesh laid bare is washed with a dilute solution of carbolic acid, which effectually prevents the growth of these germs, and the consequent mortification which used to render amputation so frequently fatal. It is also known that consumption, which is probably a disease set up by some of these organisms, has in a measure been retarded, if not cured by inhalation of carbolic acid. Oxygen, we know, when in excess, proves a deadly poison to these organisms, and its entire absence is equally fatal; but the difficulty in adopting this remedy is that it might prove equally fatal to the person suffering from the disease. We know enough, however, about Disease Germs to show us in what direction future research may be most profitably engaged; and it is to be hoped that before long we shall obtain either a safe and unfailing remedy, or an efficient preventive against those diseases which, set up perhaps by a microscopic particle, eventually decimate continents, and thus afford us convincing evidence of the vast importance of so-called 'little things.'

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

BY DAVID CHRISTIE MURRAY.

CHAPTER XXV.—'HE'S AN AWFULLY ODD FISH IS STRANGE.'

HAD Gerard known that Constance was going to London, he might perhaps have been more ready to accompany his father thither. But, as a matter of fact, the visit was unpremeditated. The maiden aunt in Chesterfield Street, Mayfair, had money, and was known to be kindly disposed to Constance. When, therefore, the old lady, learning from her brother that he was about to visit London, expressed a strong hope that he would bring Constance with him, Mr Jolly accepted the desire as a command. He was not unaware of the importance of money; and though Constance seemed already fairly provided for, it would still be unwise not to conciliate the maiden aunt, who was naturally anxious to learn at first-hand the details of her niece's engagement. And if Lucretia—that was the name of the maiden aunt—should express any intentions with respect to her testamentary dispositions, Mr Jolly was quite persuaded that at such a juncture nothing could be more natural. It was not diffi-

cult to persuade Constance; for, to tell the truth, she was beginning to find the social atmosphere of the Grange a little stifling. Her father's dull pospositives and shallow aphorisms were insufferably tedious. There are a good many dull and pompous fathers in the world, whose daughters, aided by Love, revere and admire them. Constance was unhappily without Love's aid, and her father wearied her exactly as any other prosy person would have done. In his inmost soul, Mr Jolly had an idea that his style was Disraelian. He was Conservative in politics, and modelled himself naturally on the lines of his party chief. But it is not everybody who can fight in Saul's armour, and the Disraelian style, handled by Mr Jolly, was a cruel thing to suffer under. Reginald found it endurable, because it awakened his own sense of humour. He saw the fun of it; but Constance, who, like many charming women, had but a limited perception of fun, saw and felt only its dreariness. The house itself was somewhat dull after that fever of festivity into which Mr Jolly had for a time plunged it, and she was willing to welcome any reasonable pretence which called her away from it. These two were the reasons which she admitted to herself; but there was another which had more weight than both of them, although she was reluctant to own it—she was weary of Gerard.

Admiration is a pleasant thing to endure, but the signs of it may be so presented as to grow tedious. Gerard had no small-talk, and his icy divinity froze him. He was not happy in her presence; but his dreams of her presence made him happy. There was not the faintest doubt in his mind that when once they were married they would live a life of pattern felicity. The old truth which it was Pope's good fortune to crystallise for English-speaking people, operated here as elsewhere:

Hope springs eternal in the human breast;
Man never is, but always to be blest.

The future was roseate; the present, misty. Always that wonderful glamour, which perhaps alone makes life worth living, lay about to-morrow, but never about to-day.

Whether it were an old device or a new one, I cannot say, but I remember that in the year 1865 I witnessed an acted morality or mystery, the memory of which has remained with me. The scene was the cavalry barracks at Cahir, in County Tipperary—the occasion, the annual regimental sports of the Fourth Royal Irish Dragoon Guards. When the sword-exercise and foil-play and boxing, the running, walking, leaping, and vaulting matches were over—when the men had raced behind wheelbarrows and jumped in sacks, and the tug-of-war was lost and won, there came, to crown the festival, a donkey-race. Private Paddy Byrne, a regimental unit attached to the F Troop—this is not fiction, but history, and when, O when, did it cross Paddy's mind that an old comrade would put *him* in a novel?—with a wonderful laughable Irish grin on the Hibernian face of him, perched himself an inch or two forward of his donkey's tail, and laid between the mule's ears a switch,

on the end whereof swung two inviting carrots and a clean white turnip. Away went the donkey in pursuit of these tit-bits, never more than a stride's length from his watering teeth, yet never attainable. Every stride deceived him; but Hope sprang eternal in the asinine bosom, and he still pursued. I was young and thoughtless in those days, and at this acted mystery I laughed unthinkingly. But in the years which have gone since then, I know now that not a day has passed in which I have not with equal wisdom raced after something no more worth having and no more attainable, and Paddy Byrne's donkey has with me risen to the dignity of a moral *mythus*, preaching eternal truths. And he typifies, indeed, not me alone, but a whole hungry foolish world, tearing headlong in pursuit of that sweet and dear to-morrow which it never reaches. With the rest of the world, let him typify this poor hungry-hearted Gerard. 'If I laugh,' wrote the saddest satirist that ever put pen to paper, 'tis that I may not weep.' One may as well put things cheerfully as sorrowfully. You may suck marrow of mirth, and grow as wise as by sipping the salt of tears—if you are a born angel, and if saint by nature.

Mr Jolly apprised Constance, in the afternoon, of her aunt's desire; and it was decided that they should all three go to town together on the following day. Gerard came in the evening as usual; but she allowed him to ride away without telling him of the arrangement made. An hour before starting, she sent him a brief note, saying that her aunt desired to see her, and that she was going to London, but of design aforethought, forgot to give her lover her town address. She remedied this omission a day or two later, when she had secured a little quiet, and had discovered that it is better to be bored by admiration than not to be admired at all. To her amazement, Gerard did not fly to her when she lifted her finger. A day or two passed, and she did not hear from him. Matters grew a little wonderful, and even a little alarming. We have seen already that Val Strange made a call upon her. Familiar as Val contrived to seem in Reginald's eyes, this was his first visit; but he and Miss Lucretia were known to each other beforehand, and Val was a reminder to the old lady of her one romance. These renewals of youth are singular. Val's father was the only one among many admirers for whom Miss Lucretia in her youth had cared; but with that perversity which is a part of love, they had quarrelled over some trifle or other no bigger than a mote in a sunbeam, and had so parted—the man to forget as men forget, the woman to remember as women remember. Of this the young fellow knew nothing. Had he known, he might have sought the sympathy and intervention of the old lady, and have besought her to implore Constance to break off a loveless engagement. It is hard to say whether such a course could or could not have been justified, though there is little doubt that Val would have been able to justify it to himself. But he was ignorant of the tie between himself and the old maid, and knew nothing of the affection with which she regarded him. Had he known, the course of this story might have been altered; but then, there is nothing so slight in life that it might not alter the course of any human tragedy or comedy. And now Val was gone from Con-

stance's little circle, and still no Gerard came. The absence of one, and the silence of the other, became remarkable, before Reginald came to explain one of the phenomena, and a shock which was in its way a sort of social earthquake, came to explain the second. Reginald lounged in a day or two after Val's departure, and found his sister alone. Some conversational preliminaries being gone through which had but little interest for either of them, Reginald said casually: 'I say, Con., did Strange tell you he was going to the West Indies?'

'No,' said Constance, bending closer over her embroidery. 'When is he going?' She tried to make the question sound commonplace and disinterested, but read failure in her own tones.

'Oh,' said Reginald, ensconcing himself for more safety behind his eyeglass, and watching her keenly, 'he's gone. Started yesterday.'

Constance, with a great effort, retained composure. 'Why did he go?' she asked. 'Had he business there—property there?'

'Oh,' said the wary youth, 'you never know where to have Strange. You'd think he was dead-set on something or other, and meant to spend his life at it, and in half an hour he's dead-set on something else. As I told him the other day, he's like Dryden's Duke of Buckingham, "Everything by turns, and nothing long." You never know what he'll do next.'

Women are much better actresses than men are actors, and when Constance spoke, her nonchalance might have puzzled a less careful observer. She held her embroidery a little from her in both hands, turned her beautiful head this way and that, regarding it; and then, slowly raising her violet eyes, she dropped one negligent word: 'Indeed?' But she had not calculated that Reginald suspected, and was watching, and so she overdid it by a trifle, and seemed to his keen vision supernaturally indifferent.

'Yes,' murmured the watcher, fixing his eyeglass with a facial contortion which laid the ghost of expression still lingering, 'he's an awfully odd fish is Strange. You really never know where to have him.' He was modest enough to distrust his own powers, and he stopped short there, having done enough, as he conceived, for one day. His finesse was well meant, and for the moment it was satisfactory.

'So,' said Constance to herself, 'he has run away to avoid me.' Her heart sank at this desertion. She had forbidden Strange ever to speak again on the topic he had once broached to her; but she had not forbidden him her presence, and indeed had not the strength of heart so to deny him or herself. She pitied him—it was sweet to pity him. Before she had heard his confession, she had gone the usual maiden path to love, and had not known to what goal it led her. She found his society pleasant, more pleasant than that of any man she had ever encountered—so much, she was aware of. She knew that her society was pleasing to him; but for so beautiful a woman, she was amazingly devoid of vanity, and no thought of his being in love with her crossed her mind. For that matter, her engagement to Gerard seemed to hem her about with a sort of Society sacredness—men did not fall in love with young ladies who were engaged to be married. And when at last Strange's wild

declaration was made, her own heart answered it with a voice which there was no chance of mistaking. Here at last was the man who held the key to her heart, out of all the scores who had come a-wooing, and he came too late. It might have seemed easy enough to do the only thing which under the circumstances was wise and honourable—namely, to send Gerard his dismissal and to tell him that a union between them could lead only to unhappiness. But the wise and right thing to do is not always that which presents itself most attractively, and she had no one to advise and help her. That Gerard would have freed her, had she appealed to him, though he broke his heart in doing it, went of course without saying. But then, there was the natural disinclination to so pronounced an action, the natural fear of his silent reproach, the natural dread of the county talk. It would be bitter to be called a jilt; and there was no reason or shadow of a reason, except the true one, which she could assign against her engagement to Gerard. So, like wiser people, she decided to let things take their course for a time, with a vague hope that something might come to pass which would unravel the tangled skein and lay it out straight and smooth once more. And her reluctance to pain Gerard had more ground than a natural tenderness of disposition which is happily common to most women. She respected him, and in her secret heart was sensitively afraid of his ill opinion. Notwithstanding the general chilliness of their courtship, they might have made a very happy married pair, but for the advent of Val Strange. It is only in novels that husband and wife are kept apart by those thread-like filaments of feeling of which a certain school of feminine romancists are so prodigal. The plain English of that matter is, that unless a man is absolutely distasteful, or the woman's mind is preoccupied, marriage is the shortest way to love, and the surest.

SNAKE-ANECDOTES.

IN TWO PARTS.—PART I.

To the generality of people the very word snake conveys a shuddering impression. The animals themselves are regarded with wholesale aversion. Nor is this altogether to be wondered at when we consider the terrible effects produced by the bite of many species—the mortal effects produced by a certain section of the tribe. There are, however, some folks who, so far from entertaining any aversion to those creatures, are anxiously engaged in studying their ways, their mode of life, and happily the dreaded powers with which the poisonous species—one-fifth only of the entire race—are endowed. In Great Britain, one species only, the adder, is poisonous, though not to the extent of being deadly poisonous; but the case is different in countries such as India and South America, where there are snakes from whose bite there is no hope of recovery. Happily, these death-dealing creatures are few compared to their more innocent brethren, though in India the fatalities which are yearly reported are still as appalling as ever. With a view to providing a remedy for the bite of what are termed deadly

snakes, many experiments have been, and still continue to be made; but as yet we have heard of no certain cure. One of our greatest authorities, Dr Fayrer, is obliged to admit that there is no hope for the person who has been bitten by a cobra whose poison is fully secreted and delivered.

Our contributor Dr Arthur Stradling, late of the Royal Mail (Marine) Service, who favours us with the following interesting anecdotes, has made a lifelong study of the habits of snakes, both poisonous and non-poisonous. He has, we believe, made many experiments with the hope of mitigating the dire results accruing from snake-bites, and has even gone the length of voluntarily permitting various poisonous species to exercise their fangs upon his own person! Taking certain precautions beforehand—the nature of which Dr Stradling has not yet made public—he has risked his life in the endeavour to counteract the baleful effects of snake-poison. If in the end he may be enabled to prescribe an antidote that shall prove effectual in staying the effects of the dreaded virus, mankind will owe him a debt of gratitude akin to that which it has paid to the discoverer of vaccination.

With this prelude, we offer to our readers a few of the Doctor's snake-stories. He writes as follows:

For the truth of the following anecdotes, in which serpents play a part more or less prominent, I can vouch; the incidents—except the first—having all occurred within my own personal experience. The exception, however, is matter of history at the Zoological Gardens; and not only were the eye-witnesses of the occurrence—among whom were Mr Bartlett and the late Mr Frank Buckland—well known to me—my informants, indeed—but the snake itself afterwards became a great friend of mine.

A few years ago, an immense anaconda or water-boia was received at the Gardens in Regent's Park, brought in a barrel on board a steamer from Central America to Liverpool, and forwarded thence by rail. This reptile, as perhaps my readers are aware, is the largest of the serpent tribe, inhabiting the swamps of Tropical America, and sometimes attaining a length of thirty or forty feet, it may be much more. It is one of the Constrictors—that is to say, it is non-venomous, and kills its prey, like the boa and python, by crushing it within the convolutions of its powerful body. In the British Museum there is a fine stuffed specimen, about thirty feet long, represented in the act of seizing, though not constricting, a peccary. The subject of my tale measured twenty-three feet in length, and in girth was equal to the circumference of a man's thigh—a formidable customer, capable of swallowing a sheep. Prepared for his reception, with the floor duly gravelled, and a tank with water, Den No. 3, on the left-hand side of the reptile-house, counting from the entrance-door, was allotted to him; and within the cage is a stunted tree, up which these large serpents are wont to climb. The top of the cask unscrewed, the creature was allowed to find his way into the cage through the small aperture behind.

Roaming about in the full enjoyment of his new-found liberty, he presently turned round between the tree and the front of the cage

—a space of several feet—in such a way that the bight of his body—to use a seafaring expression—lay within this space. Here, feeling the contact of the glass on one side and the wood on the other, he suddenly expanded his coil, probably in the sheer luxury of being able to stretch himself, and pushed the front of the cage out! Not simply the glass itself, which was not broken, but the heavy framework in which it is fixed, was forced away from its connection with the surrounding beams. Hereupon, several of the spectators had the presence of mind to rush forward and catch the sash before it could fall to the floor. In this way they supported it as well as they could with hands and knees until fresh assistance arrived, for the weight was too great for them to lift it back into position again; while the reptile inside, excited by the shouting and commotion, was dashing about furiously in all directions. This scattered the gravel about; and it was then found impossible to return the frame into its proper place, as the groove was choked with the small stones. Mr Frank Buckland, aided now by a number of men from all parts of the Gardens, still kept the glass from descending, while the keeper and carpenter, who got into the cage from behind, having thrown some blankets over the snake and pushed him into a corner, proceeded to scrape away the gravel. But the anaconda, now thoroughly enraged, contrived to extricate his head from the covering, and before the men could escape, flew at the carpenter and seized him by the shoulder. The keeper courageously turned, gripped the serpent by the throat, and forced him to let go, but not until the unfortunate man's arm was terribly lacerated by the powerful lancet-like teeth.

Luckily, the door of the reptile-house had been locked when the first *contretemps* took place, so that no casual visitors were witnesses of the scene; otherwise, fainting women and horror-stricken men would doubtless have added to its confusion. By this time the groove was clear, and the frame temporarily secured, so that the carpenter made good his exit, while the keeper, watching his opportunity, flung the creature from him and jumped out.

But it afterwards became very tame and tractable, and I established very friendly relations with it. Many a time have I stood at the door with Holland the keeper, and allowed it to rear its great black-spotted head out of the tank till it flickered its tongue against my face, while I patted its shining scales with my hand. Towards Holland it was most affectionate, and would always come up to the grated ventilator to see him when he was sweeping out the passage behind, though it took no notice of the people in front. Snakes take strong likings and dislikes to people, often unaccountably. Holland was one of the kindest and most intelligent keepers that ever handled a reptile, and could generally win any thing's confidence; yet there was—and probably is still—a West African python, some sixteen feet long, in the house, that positively conceived a murderous hatred of him. Why this should be so, neither he nor any one else could ever understand; but it is a fact that this python at feeding-times would sit up close to the door and wait, not for the ducks and rabbits, but for him!

The anaconda to which we have just referred was eventually killed by a guinea-pig! The little animal had been put into the den for a smaller snake's delectation, as our friend was torpid just then, owing to the approaching casting of the skin, in which state they do not feed. The guinea-pig was running carelessly over him, and the irritation of its feet probably caused the anaconda to move slightly, for its leg became entangled between two folds of the serpent's body—not constricted or nipped in anger, in which case it would have been all up with guinea-pig in a very short time—and it could not get free. It must probably have struggled some time, and then bitten its unconscious captor till it got away, for a great hole was found in the snake's side, and it lost much blood. This caused such profuse suppuration and ulceration of the whole body, that the poor brute had to be destroyed.

I have succeeded in bringing alive to this country two specimens of that deadliest of serpents, the Brazilian gurusucu, or bush-master as it is called in Guiana; and in connection with the first of these I had a disagreeable little adventure. It was sent to me in Rio de Janeiro in an open bowl-shaped basket, having been caught with a lasso, which, drawn tight behind its large triangular head, and passed through the wickerwork, secured it to the bottom of the basket. Evidently, it could not go home like this. I had no snake-tongs, and was not at that time quite so confident about manipulating poisonous serpents as closer familiarity with them has since made me; besides, a cabin on board ship contains so many nooks and crannies wherein a snake, once escaped from control, would be wholly irrecoverable. Therefore, I covered the mouth of the basket with canvas in such a way as to convert it into a sort of kettledrum; and cut a square hole in this, which corresponded exactly, when the drum was turned upside down, to an aperture in a snake-box, made by removing the perforated zinc. Then, applying the two accurately together, I cut the noose from the outside, in the hope that the reptile would drop through into the box. This, however, he refused to do, but darted round and round inside the basket, striking passionately; and as the wicker was neither very thick nor close in texture, it may be imagined that the situation was rather a sensational one. I had commenced operations just as we were steaming out of the Bay of Rio; and while affairs stood in the position I have indicated, we crossed the bar. The heavy swell from the outside caught the ship right abeam, and caused her to give two or three of the most tremendous lurches I ever experienced. I thought for the moment that she was going over. Everything in my cabin went adrift; books, boxes, cages, chairs, and about a dozen other snakes, came tumbling about me with a deafening din of smashing glass and woodwork. I lost my footing, and was thrown down; and as the ship rolled back to the weather-side, a huge wave thundered in at the open port and flooded the cabin; but I clung to my basket and box all the time, holding them together literally for dear life; for I knew I might as well be drowned or get my brains knocked out, as let my prisoner escape. He was safely housed at last; but a filament of the grass

lasso remained around his neck, spite of all my attempts to disengage it; this interfered with his respiration, and he died shortly after his arrival at the Zoo.

Having brought home many scores, perhaps hundreds, of live snakes in the course of my voyages, I have at different times published the results of my experience in that line, in the hope of inducing others to do the same. In the study of ophiology, living specimens are a great desideratum, since, after death and in spirits, snakes alter so much as to be scarcely recognisable, especially when injured, as they usually are. Nothing is more easily or safely kept during a voyage than a snake, if attention be paid to one or two small details. It is more easily kept than a bird, as it requires neither food, water, light, nor abundant ventilation; and beyond warmth, needs scarcely more care than a dead one in a bottle; but I suppose it is because these small details are so little known that we get so few rare snakes at the Zoo. In my papers, I have endeavoured to point out not only all that is necessary for their well-being in transmission, but also the dangers connected with them to be avoided on board ship. Nevertheless, an incident happened to one of mine some time ago, the possibility of which had never entered my head. I say to 'one of mine;' but in reality the reptile, a fine full-grown rattlesnake, did not belong to me, but to a brother-officer, who had bought it for presentation to the Zoological Garden at Hamburg, on the strength of my promise to look after it for him. It was brought on board in a small square box—a Schiedam-case, in fact—neatly tied up in brown paper, at my suggestion, and labelled 'Feather Flowers,' for the benefit of inquisitive passengers. This box was fronted with galvanised wire-netting of small mesh, which must have been nailed on after the snake had been put in, as there was no door. All was perfectly secure; so, as I had a numerous serpent tenantry at the time in my own specially constructed cases, I decided to let my lodger remain where it was, more especially as I judged, from its plump appearance, that it had lately fed, and would require no more nourishment till it got home. (It is worthy of remark that, as a rule, snakes feed, or require to be fed, only at long intervals; a rattlesnake has been known to live a year and eleven months without food.)

Imagine my surprise when, on going to my cabin about a week later, I met a little rattlesnake, six or seven inches long, climbing over the combing of the doorway! There was no doubt about it; *Crotalus horridus** was written in every scale of his wicked little head and diamond-patterned back, and signed by the horn at the end of his tail, which went quivering upwards as soon as he saw me. It was not a time to stand on ceremony, so I stood on *him* instead. Inside the cabin was another, wriggling along the floor, on whom also I executed a *pas seul* without further inquiry; and on turning round, sure enough there was a third on the washing-stand, sticking up his head and tail with the most menacing intentions. There was no longer any doubt that an interesting event had happened, a fact which was evidenced by the spectacle of

the box swarming with writhing little corkscrews, one of which was in the very act of escaping through the wire. I snatched up a towel and pressed it over the case; and while my boy nailed it on, and thus blinded the front, I despatched the two strays.

Now came the question, What was to be done? The inmates were safe enough for the time; but it obviously would not do to trust to a thin towel as the only dividing medium between them and the ship at large, for the rest of the voyage. I had to be cautious then, not being in possession of the means which place me now to a great extent beyond the pale of danger, and allow me to handle these things with comparative impunity; but I was none the less anxious to save the brood. A woman happily extricated me from my dilemma—the old stewardess, who was quite in my confidence, since she 'didn't mind them things,' and who used to allay any anxiety on the subject among lady-passengers with, I fear, a greater regard for me than for the truth. She gave me an old stocking; and this is what we did with it. First, we removed all the nails from one corner at the back of the box for about two inches along the two sides of the angle, and fixed a screw instead at the extreme angle itself. Then, with an excision saw—out of my case of surgical instruments—we cut through the wood for two inches each way, so as to complete the square, then nailed the mouth of the stocking over it, and finally removed the screw with a small screw-driver through a tiny slit in the stocking itself. The piece of wood, two inches square, thus severed all connection, and the screw dropped down into the foot; and by dint of shaking and knocking, the little reptiles were induced to follow. When a good many were in, the stocking was tied with cord tightly near the heel, and again about an inch higher, and the lower part was cut off between the two ligatures. This was emptied of its contents into a glass box which stood ready for their reception, while the rest of the babies were shaken down into the leg of the stocking, which still remained a *cul de sac*. The only hitch in the proceedings was a momentary though rather serious one, caused by mamma protruding her head and evincing a disposition to follow her offspring. When all the little ones—there were thirteen of them, exclusive of those I had killed—were out of the box, the bag was again tied twice, and divided; and they were restored to the society of their brothers and sisters.

But stop a bit! The resources of our very subtle contrivance were not yet exhausted. About a foot-length of that most useful stocking was still left, and this was tied once more, but this time close up to the box; then the lower end was untied, two rats introduced and fastened up again; then, the upper ligature being removed, the rats were shaken into the cage, and the maternal rattlesnake was compensated for the loss of her promising family by a good dinner. Finally, the stocking—or what was left of it—was pushed into the box, and the square piece of wood was nailed securely on again over it. But there was a pleasing uncertainty for the remainder of the voyage as to how many had got adrift before I discovered them, and where they had

* The Latin name for the rattlesnake.

stowed themselves, which rendered going to bed, putting on one's boots and the like, full of interest. When the importation of rattlesnakes becomes a recognised branch of industry, I shall take out a patent for that stocking dodge.

THE FISHERWOMAN OF HONFLEUR.

A TALE OF THE FRENCH COMMUNE.

IN FIVE CHAPTERS.—CHAP. I.

THERE was an unusual stir and bustle in the old-fashioned and generally dull town of Honfleur, opposite the port of Havre, in France. The old weather-worn, worm-eaten, wooden wharfs and jetties were thronged with fisherwomen and girls, all clad in their gala attire, whose number increased as they were joined by fresh arrivals from the neighbouring sea-coast, many having come from distant villages and hamlets. There was such eager, lively, and continuous chattering, that a stranger might have imagined there had occurred a second confusion of tongues—confined on this occasion to the gentler sex. The eyes of all present were directed seawards, and from time to time, some one would mount one of the wooden piles to which small vessels that frequented the harbour were moored, and, pointing to a speck on the water, visible in the far distance, would cry: 'Ils viennent! Ils viennent! Je les vois!' (They come! They come! I see them!) And for a few moments the clamour of voices would be hushed, only to break forth again with expressions of disappointment; for these fisherwomen and girls had assembled to greet the return of husbands, brothers, sons, and lovers who had been long absent, engaged in the cod-fishery in the stormy North Sea.

For many weeks past, the weather had been tempestuous; and those who had friends and relations at sea—and these comprised almost every inhabitant of the town and the neighbouring sea-coast—had passed many a sleepless night, listening to the fierce gusts of wind that swept around their humble and often exposed dwellings; or had started out of a troubled slumber to breathe a short but earnest prayer for the safety of the absent ones; for there had come from time to time sad stories of fishing-vessels that had foundered at sea with all hands; and all who heard these dismal stories dreaded lest the lost vessels might be those which had sailed a few months before with their dearest relations and friends on board.

On the previous night, however, a steam-packet had arrived at Honfleur; and her captain had reported the glad tidings that he had that day passed the homeward-bound Honfleur fishing-fleet off Dieppe, all safe, and that, as the wind was favourable, the vessels might be expected to arrive in port the next morning. Hence the vast and eager concourse of fisherwomen from the town and the adjacent coast.

At length there was a general hush. A speck that to a landsman would have appeared like a bird hovering over the water, was discerned in the far distance; then another, and yet another became visible. There was no longer any doubt that the fleet was approaching. Nearer and nearer the vessels drew; the cut of their sails

could be discerned; then their low black hulls appeared, and the experienced eyes of the fisherwomen recognised the vessels in which their husbands, lovers, and sons had sailed. The women counted the approaching luggers. Not one vessel of the little fleet was missing. But it yet remained to be seen whether all the crews had returned safe and well; and the hearts of the anxious watchers beat quickly, with hopes, doubts, and fears commingled.

Another weary hour passed away, and the vessels were off the port. Then arose from them a cheer which brought relief to the anxious women. Well they knew its meaning. It announced, that all who had sailed with the fleet had returned safe and well. The cheer was answered with a general shrill cry of joy. The vessels entered the harbour and ranged up alongside the wharf; and amidst cries of welcome, bursts of hysteric laughter, and tears of joy and gladness, the hardy, weather-beaten fishermen leaped on shore to greet their impatient loved ones. It was a strange yet pleasing sight to see these stalwart, weather-browned, whiskered and bearded seamen, clad in their coarse pilot jackets, tarry petticoat-trousers, heavy sea-boots, and oilskin sou'-wester caps—their garments still damp, and glistening with the spray which had fallen in showers over the vessels' decks, even to the moment when they entered the sheltered harbour—clasped in the loving embraces of the women and girls the instant their feet touched the wharf. The elder women, though brown and wrinkled, were yet robust and healthy; the young women and girls fresh and comely, with pleasant pretty faces, fair complexions, blue eyes, and glossy brown hair. All alike, old and young, were neatly and smartly attired in their picturesque fisherwomen's costume, with high, wide-frilled caps, white as snow, short, full petticoats, creaseless blue or gray stockings, and neat buckled shoes, which set off their well-formed lower limbs to great advantage; while many of them wore large earrings of real gold, handed down as heirlooms from grandmothers and great-grandmothers.

Amongst the first to leave their craft was a tall, handsome, young man, with laughing blue eyes, and curly, dark-brown hair, who leaped to the wharf into the extended arms of a pretty girl, apparently not more than eighteen years of age, who, as she embraced her lover, seemed perfectly regardless of the surrounding crowd.

'Welcome—welcome home, my Antoine!' cried the girl as she kissed her lover's whiskered cheek. 'Ah, how I have prayed and sighed for thy return! The storms have been so severe; and we heard such bad news that my heart was troubled. But the blessed Madonna hearkened to my prayers, and again I behold thee safe and well. The sight repays me for all my sufferings.'

The youthful pair released each other, and forcing a passage through the thick of the crowd, strolled away side by side in the direction of their native village, each with an arm twined round the other's waist. There was silence for a few minutes. Both were happy with their own thoughts.

Madeleine at length broke the silence. 'Thou hast not told me about thy voyage, Antoine. Has it been successful?'

'Successful as I could desire, my Madeleine,' replied the young man. 'If the gales have sometimes blown fiercely, it is what we fishermen must look for; and we care little for the weather if other things favour us. The good St Antoine [St Anthony is regarded by the French fishermen as their patron saint] has watched over us, and guided our vessels safe home.—And now, hearken, Madeleine! Tell me, dearest, is it not time that we possessed a lugger of our own?' glancing over his shoulder towards the vessel he had just quitted, whose masts could be seen amidst those of the other craft in the port. 'Will not the gains of this voyage make up the necessary amount, Madeleine?'

It is customary among the fishermen of the northern and western coasts of France, on their betrothal—which usually takes place at an early age—to some young maiden of their class, to place their wages at the end of each voyage in the hands of their *fiancées*, for safe keeping, reserving only what is sufficient for their necessary expenditure, and for the renewal of their outfits before they sail again, with perhaps a trifle beyond this amount, to pay for their small indulgences and harmless recreations. The young women having attended school when children, are generally possessed of some little education; while the boys go to sea with their relatives or friends as soon as they are of the slightest service on ship-board. Thus, few among the latter know how to read or write. It is customary also with the young women, after betrothal, to stipulate with their lover, that, previous to their marriage, some object for their mutual benefit shall be attained, such as the purchase of a fishing-lugger, or a share in such a vessel, or at least the means of purchasing the needful furniture, &c., for a humble household—according to their position.

Antoine and Madeleine belonged to what may be termed the superior class of fisher-folk. Both had been left orphans at an early age, and each had inherited a few thousand francs on the death of their parents. This money had been carefully set aside—but not in a bank. The French fisher-folk, in the days of which we write, had no faith in banks, and preferred to keep their savings where they might be secure, and ready to hand when required. To these joint bequests, Antoine's wages, and Madeleine's earnings from knitting and fancy-netting in her leisure hours, had been added from time to time, until, when Antoine sailed on his last voyage, but a small addition to the savings already accumulated was needed for the accomplishment of the desired object.

Madeleine—although she had been firm in her resolve not to wed her lover until the object of their mutual ambition was secured—was no coquette. 'It is now three years ago, my Antoine,' she replied to her lover's question, 'since we betrothed ourselves to each other in the chapel of Our Lady of Lorette. I was then but sixteen, you were nineteen years of age. I shall be twenty years old on my next birthday, three weeks hence. We have more than sufficient, Antoine, for the purchase of a lugger with everything on board complete, without counting thy profits on this last voyage. My poor old uncle, Pierre le Blanc, died soon after you sailed the last

time, and he left me a handsome legacy. The profits of your last voyage will be so much extra, which we can lay by, or expend on furniture and such other things as may be necessary. Perhaps, Antoine, if thou wilt, my approaching birthday may be our wedding-day?'

It is needless to state that the young fisherman was more than willing that the wedding should take place at the time mentioned by his *fiancée*. In due course the banns were published in the little village church, and on the anniversary of her birthday, Madeleine Letour and Antoine Duroc were united.

A new fishing-lugger, with masts and spars and sails and rigging all complete, was purchased; and Antoine remained at home for some months after his marriage, leisurely preparing his vessel for sea, but chiefly passing his time with his young wife. Occasionally, with the object of testing the qualities of the new vessel, which was called *The Madeleine*, the young fellow sailed for a day's fishing along the coast; but, for the first time since he was old enough to go to sea, the Honfleur fleet of luggers sailed for the far distant cod-fishery without him.

It has been hinted that when the meeting took place between the returned fishermen and their wives, sisters, and sweethearts, all present on the occasion were too full of joy to care to conceal their happiness. There was, nevertheless, one individual present who had no share in the general feeling of gladness, whose heart was, on the contrary, full of suppressed passion, hatred, and jealousy. This individual, however, was not a member of the fisher community. He was one Lucien Pierrot, the son of a rich *bourgeois* of Paris, who owned considerable property in Honfleur and its vicinity. Lucien was accustomed frequently to visit the town to receive the rents from his father's tenants, and on other matters of business; for though he was a gambler and spendthrift, and addicted to many other vices, he was an only son, and his father, though often deceived, continued to place confidence in him. During one of these visits, at the date of the annual Honfleur fair, Lucien met with Madeleine—who was visiting the fair with a party of female friends—and was struck with the grace and beauty of the young fisher-girl. He sought to introduce himself to her by offering her trifling presents as 'fairings;' but the fisher-folk are an exclusive class, who hold themselves aloof from strangers. Madeleine declined, bashfully, yet decidedly, to accept the proffered gifts, and strove to avoid the young man's attentions. In nowise disconcerted, however, Lucien, taking advantage of the license allowed at fair-time, attached himself to the party, in the hope of inducing Madeleine to look more favourably upon him, by ingratiating himself with her companions. All his gallantry was, however, thrown away. The young women took no heed of him; and separated for their respective abodes without bestowing one parting word or glance upon him.

Unaccustomed to be thus cavalierly treated by young women whom he honoured with his attentions, Lucien had been in the habit of using every effort to win Madeleine's affections. He dared not visit her at her home in the village, for he

was well aware of the pride and independence of the fisher-folk, who would stand on little ceremony with him if it became known to them that he was intruding his attentions upon one of their young people. But he contrived to meet her whenever she strolled beyond the village; and when, twice a week, she attended the market at Honfleur, he was always present, and was a frequent and liberal purchaser of the fancy wares she offered for sale. Always civil, and even polite in his manner towards her, he gave her no opportunity to complain of his conduct to her friends; yet, though she strove in every way to make it apparent to him that his presence was disagreeable to her, she was unable to shake him off. At length he grew more bold, and ventured to speak of his affection for her, and entreated her to accompany him to Paris, promising to make her his wife immediately on their arrival in that city. But he met with such a withering repulse, that he instantly regretted his temerity. The look of anger and scorn in the eyes of the young girl and the tone of her voice, told plainly that she was in earnest; and from that time, he had ceased his open persecutions. But he nevertheless resolved to gain his end by some other means. He had discovered that Madeleine was betrothed to a young fisherman; and though Antoine was personally unknown to him, Lucien conceived a mortal hatred for him, and vowed that if he failed in his object, he would find some way of revenging himself both on the young girl and her lover.

On the day when the fleet arrived in port, and the fisherwomen and girls were assembled on the wharfs, as already described, to greet their long absent husbands and lovers, Lucien also might have been seen skulking in the background, wrapped in a cloak, drawn up so as to conceal his features, eagerly watching the fishermen as they leaped on shore. He saw Madeleine on the wharf; and then he saw a handsome young fisherman, who, the moment he landed, was clasped in the young girl's embrace. He ground his teeth with impotent rage, and in his eagerness to get a good view of Antoine, stepped a few paces forward, and allowed the cape of his cloak to fall back.

As Antoine and Madeleine were forcing a passage through the crowd, Madeleine caught a momentary glimpse of her detested persecutor. The young girl shuddered involuntarily; and Antoine tenderly inquired whether she felt cold. Madeleine was almost inclined to acquaint her lover with the cause of her alarm; but she dreaded the immediate consequences of such a disclosure, and feeling secure in her lover's protection, she deemed it advisable to keep her secret. 'Now that Antoine has returned, and our marriage will so soon take place,' she thought, 'that bad man will see that it will be useless to trouble me any longer, and will no doubt return to Paris.'

Lucien continued to follow the young couple at a distance, midway to the village. Had he dared, he would have interposed himself between the lovers; but Lucien was naturally a coward; he knew that the stalwart young fisherman would have crushed him as easily as he could have flung a child from him, and he was forced to content himself with brooding over

plans of vengeance. He could do nothing just now; but he thought it probable that after her lover had again gone to sea, Madeleine would be more amenable to his advances and persuasions. And if such were not the case, he believed in his power to find some means of wreaking his vengeance upon both. So he turned aside from following them further that day, and left the happy and youthful couple to the enjoyment of each other's society.

HUMOURS OF IRISH DISTRICT VISITING.

'Miss MARTHA, it's Anty Dillon's Molly that's here. Her mother is tearin' mad wid the toothache, an' would ye be afther givin' her the laste taste in life of jam, she says, if you plaze, to take the stang out of her mouth, an' help her swalley the bit o' bread? She hasn't slep' or et for two days.'

'Miss Ellen has gone out with the keys, and won't be back till after the Bible class.'

'Shure, I tould her that, Miss, an' she says she'll come agin bime-by.'

'Jam for toothache!' I exclaimed.

'Yes; it is a grand specific,' said Martha drily, 'especially in families where there are children. There is an epidemic of toothache this spring. Last year it was influenza, till I began to give black currant vinegar instead of jam. But vinegar won't do for the teeth, you know.—And now I am sorry I must leave you for an hour; one of my old women is dying, and another has sent to say she is "downhearted," and wants to see me particularly.'

'May I go with you? I would like it, if they don't mind.'

'Oh, they will be delighted to see a strange lady. But I am afraid you will find it lugubrious. Their talk will be all about death and the grave, this time. However, it will be characteristic, and possibly amusing; so, come along.'

'You see,' said my friend as we set out, 'the Roman Catholics are as twelve to one in the town, but there are a good many Protestants for all that—poor ones, and the Archdeacon is very careful of them. He knows them all personally, and their circumstances, and goes to see them himself when necessary. The parish is divided into districts, with a lady-visitor for each. We go our rounds once a week regularly, and report to the Archdeacon anything that requires his attention. And if our people fall into necessity or tribulation, want advice or help, they send for us, or come to us, at any time. "I niver felt the loss o' me father an' mother till Miss Mary got married an' wint away," said an old woman to me once, speaking of one of us who had left the town. They often tell me I am like a mother to them.—Here we are at Mrs Nolan's. Yes; she's still alive, I see.'

It was the usual mud cabin, the open door admitting to the one room which served as kitchen, sitting-room, and chamber of death. A kettle was boiling on the hearth, and a teapot stood by. Two or three women sat round the fire, waiting for the final scene. The place was swept, and the furniture set in order; and by the bed, where an old woman lay slumbering fitfully, a chair was placed for visitors.

'Shure, you're just in time, Miss Martha—she's goin' fast,' said one of the women as she came forward and welcomed us.—'Yis, Miss, she's sensible.—Ye know Miss Martha, Biddy, don't ye?'

A smile came over the wrinkled features, and the heavy lids unclosed.

'Now, won't she make a purty corpse if she only looks like that at the last!' said the woman admiringly.

'I am glad to see her so calm and peaceful,' whispered Martha.

'Isn't it a comfort, Miss?' cried the woman out loud. 'An' it's the work o' the world we had wid her till yisterday only, whin His Riverince himself cum down an' reasoned her into common-sense, an' she guv her consent to go to the new cimethry, quiet an' asy.'

'To go to the new cemetery?'

'Yis, Miss. Shure, she held out agin it to the last; said it was a horrid, cowl'd, lonesome place, an' she'd niver lie comfortable there, wid niver a bone or a pinch o' dust of one belongin' to her within a mile. Cart-horses, she said, shouldn't drag her there, or to any place except a good churchyard full o' dacent Christian neighbours. But the Archdeacon argu'd the matther well. "Biddy," sis he, "be rasonable now. Where in all the country-side would you find a wholesomer place to be laid in," sis he, "than the new cimethry?—a fine, open, airy place, high an' dhry. An' as for lonesomeness," sis he, "shure, it's fillin' ivery day—it is. Ye'll have the neighbours gatherin' all round you in no time. An' I'll tell you what I'll do for you," he sis; "if you'll consent to go there quietly, I'll put you nixt Mrs Donovan—shure, ye know her—an' thin ye won't feel lonely or out o' the way wid her within call." So thin she guv in.'

'Yis, I guv in,' said the dying woman feebly. 'I cudn't howld out agin' His Riverince. There's no denyin' that Mary Donovan 'ud be a good neighbour, quiet an' asy, an' niver an ill word out o' her head; but I'd rather be laid alongside o' Nolan. A good husband he was to me, an' niver as much as riz his hand to me all the days we wor togither—barrin' he was in dhrink an' unconscious-like.'

'Alongside o' Nolan! Just listen to her now! And Oonagh churchyard twenty mile o' rough road away. Shure, it's battered to bits you'd be afore you got there, Biddy alanna. Yer ould bones 'ud niver stan' the jowltin'. An' prehaps it's come to bits the coffin would, they make 'em so thin nowadays.'

'Ay, ay; I know how thim funerals go gallopin' whin they git out o' the town; I'd be shook all to pieces, I'm feared, an' so I guv my consent to go to the cimethry. It's an asy road enough; an' what does it matther, ather all, whin the good God is in one place as much as another!'

Martha stooped down and whispered a few words. 'Yis, Miss Martha, I know; I'm none feared o' that. But I'm too far gone to spake much, honey.' Then the heavy lids dropped again over the glassy eyes, and I thought I saw an added shade on the gray face.

'I think she's goin' now, glory be to God! I know that look.'

'Miss Martha, could you be ather singin' a bit of a hymn? That would bring her to, if

anythin' mortal could; she was always fond o' the singin',' said the woman.

Martha hesitated, looked at the still face, and then at me—'Rock of Ages,' I whispered—and she began the dear old hymn at 'While I draw this fleeting breath.'

I saw the pale lips move, and stooped down.

'Nolan's voice!' Shure, I'd know it a mile off.—Ye're late, man; hurry on. It's tired o' waitin' I am.—Och, but ye're the pick of the world for the singin'!—It's gettin' cowl'd, alanna, an' the night's fallin', Nolan, an' I'm wairied out.—Here you are at long-last. Glory be to God!—Nolan!'

'Glory be to God!' echoed one of the women, 'she's gone.'

It was even so. Had Nolan really come up the 'dark valley' to meet her, I wondered, as Martha stopped, and the women broke into ready Irish tears and ejaculations, in the midst of which we moved away.

The person who had acted as mistress of the ceremonies followed us to the door. 'Wasn't it well she didn't go back o' her word about the new cimethry? An' won't she make a lovely corpse, Miss Martha, wid that pleasant look on her face? We'll sind to the house for the things, Miss?'

'Yes; Jane will give them.'

'Sheets and things,' explained Martha to me, as we walked away, 'for the wake, you know. They festoon them round the bed, and cover over the tables with white. We always keep some to lend for the purpose.—But here is my "down-hearted" old woman looking out for me. I wonder what she wants cheering up for this time.'

'Come in, come in, Miss Martha.—An' you, Miss.—Shure, it's most wore out I am, lookin' for you.'

The poor old soul evidently felt aggrieved. A sickly-looking creature, with bright eyes, and a crooked back, which showed plainly, as she presently began to rock backwards and forwards on her stool. The one room was bare of comfort. As stranger visitor, I was installed on the only unbroken chair, while Martha balanced herself on a three-legged elderly one.

'I came as soon as I could,' said Martha. 'I was delayed at Mrs Nolan's. She is dead.'

'Och, wirra, wirra! Is she gone, thin? That's what I sint for you for, Miss Martha. Shure, His Riverince, he sis, I'll be the next. He had the heart to say that to me, a poor crooked old body.'

'He couldn't say that, Mrs Morris; you must have misunderstood him.'

'Deed, an' he did, thin—thim very words—standin' there foreninst me on the flure. "Mrs Morris," sis he, "Mrs Nolan is goin' fast; she'll be in glory before another sun sets over her head." "God forbid, sir!" sis I.—"She will," sis he. "An' the question is," he sis, "which of us will be the next to be called away? It behoves us to be prepared," sis he.'

'That was not saying you would be the next.'

'Ah, but it was, Miss Martha, just all as one o' sayin' it. A hearty, able, active man like him, what thought would he have o' dyin'? An' sorra preparation he wants! He might jist walk into heaven any day, wid a flower in his button-hole,

an' "God save all here!" on his lips.—No, no, Miss; it was niver himself he meant at all, at all, but me. "Mary Morris, you're goin' to die, an' you're not ready"—that's the manin' of his spache.'

'And are you ready, Mrs Morris, if you should be called next?'

'I'm not, Miss Martha, an' I don't want to be called yet a bit; I want to live my life out. That's why I sint for you. I want you to pray the good God this night to let me live out me full life.'

'Why, you are an old woman, and a great sufferer, and I should think you would be thankful to be released.'

'Well, I wouldn't, thin. You see, Miss Martha, it's not as if I was a strong, able-bodied woman. Thin, I couldn't complain whin me time was out. I've always been ailin' an' wake, an' niver got more nor half the good out o' life that others got; an' I think it 'ud be only fair o' the good God to let me live twice as long, to make it even an' just.—You'll ask Him, Miss Martha, honey?'

'I'll pray for you, certainly, Mrs Morris, that you may not be taken away before you are ready and willing.'

'Some payple are quare, an' say it's a wary world, an' they'd like to be gone from it; but I'm not that kind. The worst day I iver had, Miss Martha, I niver wished I was dead. You've tuk a load off me mind, alanna, for I'm sure the Lord 'll hear you. He's very good to thin that put Him in mind of their wants.'

'Very, very good and pitiful. You remember what David says?—'

'Shure, I wasn't thinkin' o' David,' interrupted the old creature ruthlessly. 'I was goin' to tell you about me own mother's first-cousin, ould Molly Malone. She was an ould, ould woman, an' not a bit like me, for she raly wanted to die. But she lived, an' lived, till she could bear it no longer, an' she bedridden for five year an' more. So sis she to her son Tim one day—he was her youngest son, an' gettin' to be an ould boy too, waitin' for the mother's death to bring home a wife—"Tim," sis she, "I'm thinkin' the Lord has forgotten me."—"Faith, an' I'm o' that same opinion meself, mother," he sis.—"I don't like to be overlooked," sis she. "Yoke the dunkey, 'Tim," she sis, "an' wrap me in me cloak, an' carry me up to the top o' the road, till I put Him in reminbrance," sis she.—An' he did. He put an ould bed in the cart, an' her atop of it, an' jowlted her up to the top o' the hill an' down agin widout a word. An' signs on it! Miss Martha, whin he stopped at his own dure, she was a dead woman.—"Troth, an' she was in the right of it," sis Tim. "As soon as iver He seen her, He kindly give her the call."'

'I think the jolting had something to do with it,' said Martha, rising.—'Mrs Morris, I can't stay longer now. I will come and read to you another day. Good-bye.'

'Good-bye; an' thank ye kindly, Miss. I feel quite cheered up now, honey.'

'Isn't it extraordinary,' said I to Martha, when we were out of the house, 'the clinging to life some people show? The poorer and more miserable they are, the less desire they evince to give it up.'

'Except they think they are being overlooked,' said Martha, 'like old Molly Malone. I've heard that story so often, I can't laugh at it. She only told it to put me off reading the psalm for her.—See! there are the almshouses,' continued Martha, pointing to a row of neat little houses, with pretty porches and gardens in front. 'We won't go in. It's not my day. They are not very pleasant to talk to, poor things, just now. You see their endowment is in land, and for the last two years, owing to "Land League" and other troubles, there has been no rent paid. But for the Archdeacon, they would actually starve. He pays their weekly money out of his own pocket. It is just the same with the Orphan Fund, and Aged and Infirm Protestant Relief Fund. I don't know what we shall come to in the end; the Archdeacon can't go on supporting all the poor of the parish in this way.'

'Why doesn't he get help from the people around?'

'He can't. They have not any money. The gentry are most of them living on borrowed money, waiting for better times; and the shopkeepers say business is bad. Lawyers are the only people who are making anything.—Oh! just wait a minute! This is Anty Dillon's.'

A soft-looking woman, with bare, red arms flecked with soap-suds, came to the open door at the sound of our voices. 'Good-evenin', Miss Martha!—Won't you come in, Miss?'

'Not to-day, Anty, thank you.—When did you hear from your daughter Rosanna? I hope she gets on well in her situation?'

'Deed, thin, Miss Martha, not to be afther tellin' you a lie, she don't like it at all, at all. She's for comin' home agin.'

'Why? I heard it was a very good, easy place.'

'She's not faultin' the sickuation, Miss; but, shure, no servant stays in it, specially housemaids, an' so she give notice to lave this quarter.'

'For what reason?'

'The misthress. Nobody can put up wid her. She doesn't kill thin with work, but she waries thin out with nonsical talk about their sowls, Miss, as if they were on the point o' death. But shure, she's not a Protestant at all, Miss Martha; she is one o' thim Methodees.'

Martha turned away in vexation. 'I had the greatest work to get her that place, and now she is leaving it for nothing. They are miserably poor; and she will come home, and live with them till her money is all gone and her clothes in pawn, and then she will expect me to find her another place.'

'Her mother oughtn't to encourage her as she does.'

Here Martha began to laugh. 'Her mother! Didn't you recognise her? That was Anty Dillon, who was reported as "tearin' mad with the toothache," an hour ago.'

'And wanting a bit of jam to help her to eat and sleep! She doesn't look much pulled down by her sufferings.'

'Wait till I catch Molly, I'll jam her!' said Martha, in a tone of good-natured vexation.

Presently we came to a neat, whitewashed, tidy-looking, two-roomed cabin.

'This is one of our Orphan Homes,' explained

Martha. 'Our way is to put the children by families, under the care of respectable elderly people, who bring them up as if they were their own. It answers very well. Brothers and sisters are not separated. They have all the advantages of home-life; and the tie between them and their foster-parents strengthens with time into real filial affection in many cases.—Our orphans generally turn out well,' continued Martha with excusable pride. 'We look after them, educate them to some extent, bind them to trades, or find situations for them as servants. But I think a great deal of their future success depends on the foster-mother. This woman has brought up two families most creditably, who are all doing for themselves in the world now.—Good-evening, Mrs Moore! How are the children?'

A bustling little woman, in an old-fashioned cap and a big apron, turned round from scrubbing a deal table with freestone. 'Good-evenin' kindly to you, ladies! Wait till I take off my *praskreen*;' denuding herself rapidly as she spoke of the apron, and dusting two white chairs with it. 'Won't ye sit down, Miss, afther yer long walk?—Shure the childhre is well an' hearty, thank God! They are away at the school now.'

'No, thank you; we won't sit down now. You're busy. I only came in with these little things for Betty. I think they will fit her.'

'Och! they'll be made to fit, Miss. She was just wantin' thim; an' wasn't it the good Lord put it into yer mind to bring thim this day, before the rain comes.'

'Mrs Moore,' said Martha hesitatingly, 'did you hear there would not be so much money as usual this month?'

'I did, Miss. The Archdacon come himself to insinse me into the rason of it. He was rale downcast. I tould him niver to throuble about it; shure, we'll git along somehow.'

'How will you manage this month on so little?'

'Well, Miss, you see, Moore has got a stroke o' work. That will be a help. An' I had a letther from Amerkay, from Judy—you remember little Judy Grace, Miss Martha?—an' she sint me a little matther o' money, an' that'll tide us over a month or more. An' indade, the other childhre will niver let me want the bit o' bread while they have it. They're rale good in sindin' me things.'

'But they send the money for your own use.'

'For me an' Moore. Yes, Miss. Shure, they look on us as their father an' mother. They can't remember no others, the cratures.'

'Will they like your spending it on these children, who are nothing to you or them?'

'Miss Martha, do you take me for a brute baste, to have the bit an' sup meself an' see the fatherless go hungry?'

There was real surprise and indignation in the good woman's manner. Martha felt called on to apologise for her implied suspicion of ungencosity; and we then turned our steps homeward.

'Another trait of the Irish peasantry,' I remarked; but my companion was absent-minded, and made no response. 'We must pass Tom Daly's,' she said after some meditation. 'I ought

to speak to him, I suppose; but I don't know what to say. He is a Protestant; but I heard he went to the Roman Catholic chapel on Wednesday night, and walked in the procession of penitents. He was tipsy, of course; but, that makes it all the worse.'

The said Tom held down his head, and busied himself with an old shoe he was patching, as Martha entered his little cobbler's shop. I stood modestly in the door, and listened.

'Tom, what is this I hear about your doings on Wednesday night?'

'Musha! I donno, Miss Martha. People sis more nor their prayers.'

'Didn't you go to mass and walk in the procession before all the chapel full of people?'

'Shure, I wasn't in me sinses, Miss; I was unconscious. The boys made me just half-dead; an', faix, I donno what I did or didn't do, thin.'

'Tom, if you would only take the pledge, it might be the saving of you.'

'Shure, I'm willin' enough to take it, Miss Martha, if that will do you; but the keepin' it is another matther. I've taken it often an' often; but sorra bit o' good that did me. It was worse nor ever I was, as soon as I broke it.'

'Tom, I wouldn't mind so much your going to mass, if you were in sober earnest. I would rather have you a good Catholic than a drunken Protestant.'

'Oh, Miss Martha, is it you to think so little o' me as that? An' does His Riverince seriously believe I'd do such a mane thing as turn? Drunk or sober, I'll niver belie me church an' clargy. Miss Martha, I'll tell you what I'll do. I want to mass, there's no denyin', on Wednesday night; but I was tipsy—bad seran to thim that tuk me!—but I'll go to church this blessid night sober, and with me eyes open. There's for you! That'll convince His Riverince. Shure, I niver was in church on a week-day afore, barrin' the day I was marrid; but I'd do more nor that to show the Archdacon I was no turncoat.'

Tom did go to church that Friday night, and edified the congregation by his serious demeanour.

Coming out of the shop, Martha encountered a lively group of girls and boys, when she, to my surprise, seized the biggest girl by the shoulder and gave her a good shake. 'I have just seen your mother, Molly Dillon. What did you mean, you naughty girl, by telling such a story? Don't you know that?' &c.

I need not give the sermon which followed. Molly looked frightened, and the other children interested.

Suddenly a little boy, with the bluest eyes and reddest hair I had ever seen, pushed forward.

'An' did Molly tell ye a lie, Miss Martha?'

'She did, Jack.'

'An' it's an awful wicked thing to tell a lie, Miss?'

'It is, Jack, awfully wicked.'

'An'—an' it's worse to tell two nor one, Miss?' cried Jack, stammering in his eagerness.—Martha assented.—'Miss Martha, you tould us on Sunday last that the man that made another do a wrong thing was the wickedest o' the two. It was all as one as if he did it himself, only maner.—Miss Martha, if you don't give Molly the jam, you'll

be afther makin' her tell *two* lies. She promised us a rale trate this evenin'—"Miss Martha is goin' to give me a cup o' jam," she sis, "an' I'll give yez every one a taste."—She promised, Miss; an' she can't kape her word if you make her break it.

Martha stood nonplussed.

I stepped forward to the rescue. 'She promised you a treat. Now, would sugar-stick do as well as jam?'

'Faix, an' it would, Miss, an' betther.'—A general chorus.

'And you would hold that Molly had honourably kept her word, if she gave you a stick each?'—Approving grins, nods, and asseverations.—'Well, let me see. How many of you are there? Five?—Will that do?'

General delight, and a rush towards the confectioner's.

'If you had that young imp in your class Sunday after Sunday,' said Martha ungratefully, as we reached her own door, 'you would not be so ready to encourage his impudence with sixpences. But I'm glad the day's work is over.'

CINDERELLA DOWN-STAIRS.

AFTER telling us about an animal in its wild or natural state, Natural History sometimes adds the characteristics of its domestic condition. In like manner, we have all heard of Cinderella in her natural state, surrounded by the infinite possibilities of a fairy tale; and also of Cinderella in her domestic state, in which her habits and aspects are somewhat different, and rather more interesting, than those of her former state, because they have the advantage of being real. Cinderella down-stairs has not a bountiful god-mother; often 'the Parish' has been her step-mother, and she is an 'orfling,' like the hand-maiden of the distressed Micawbers. She never gets a glass slipper, yet her shoes are transparent enough; and how the other Cinderella ever danced in glass slippers, is a marvel to us, when this poor Cinderella is always breaking glass that nobody touched, by means of an invisible cat that haunts the shelves, as other cats haunt the garden walls. But the domestic Cinderella is, at least in her occupations, like her prototype of the story. She does hard service, and is despised, and sits among the cinders. No god-mother, no dressing for a ball, no mouse-horses and walnut-shell carriage, are before her, leading through a bright vista to her destiny and to a Prince with a shining shoe in his hand. This Cinderella has not even heard of fairy transformations; she was never in Fairyland; she was never a child as other children are. Hers is the most unromantic life in the world; she lives down-stairs in unromantic regions of scrubbing and rubbing, and soap and cinders.

The best description of the common domestic Cinderella is of course from the pen that described 'the Marchioness,' and from the hand that was always finding diamonds where we blind folks only see vulgar dust. There is many a Mar-

chioness in every street of the shabby-genteel districts of all great towns. Tradesmen's wives and lodging-house keepers oppress and are oppressed by a long succession of them; and in the picture of the 'slavey' of the Dragon of Bevis Marks, lies only the strong-featured portrait of ten thousand elsewhere without the title and the cribbage. 'The Marchioness' as deftly drawn by Dickens, is an old-fashioned child who must have been at work from her cradle, afraid of a stranger, but cunning and clever—'a small slipshod girl in a dirty coarse apron and bib, which left nothing of her visible but her face and feet: she might as well have been dressed in a violin-case.' She does all the work of the house, is miserably lodged, scantily fed, and treated like a grown-up drudge; as the natural result of which hard treatment she acquires a habit of 'cooling her eye' at keyholes and generally developing her cunning. But deep down in her heart is a germ of love and self-forgetfulness and homely faithfulness, that the first touch of sympathy rouses into life once and for ever. There is something exquisitely touching in the half-sad, half-comic way in which this slipshod 'slavey,' aproned in her canvas violin-case, becomes an angel unawares. But under many a canvas bib there is a heart that is never found; poor Cinderella remains a cheap automaton; and whether she is a child, or a woman, or a witch, or a mechanical contrivance, there is no time to think, or nobody to care.

'The Marchioness' did not know how old she was; but she was in every way, except growth, an extremely-developed specimen of Cinderella. The age of these wonderful human creatures ranges from eleven to fifteen or sixteen. Most of them have had no household training, and come in the dullness of ignorance and in utter poverty out of the cheerless 'Union,' or out of miserable homes with the saddest surroundings. But the great marvel is—and it is one of the startling marvels that show on the ugly side of human nature—that these old children or diminutive women, whichever you like to call them, are expected to be perfection; and are turned adrift, as if they had come on false pretences, when their deficiencies appear—are sent elsewhere for the joltings and hard rubs of life to knock into shape their character and acquirements. They are to teach and train themselves, if they are not, as every proper-minded Cinderella should be, ready-made perfection; and if the jolts and hard rubs knock them to pieces, instead of knocking them into shape—again, nobody knows, and nobody cares.

Poor little Cinderella! only hired, and nobody's child. There is no one to believe she is a child at all; no one to care for herself and her future for her own sake; no one to teach her with kindness and with patience; no one to remember that when the cat and the mice cause mysterious disappearances, the fault, and not its doer, ought to be made to disappear; and that even when the china is broken, the ways of the 'breaker' may be mended. Cinderella is at the most tractable age: she is the very same age as the boys and girls at school, or perhaps younger; nor can she be made a woman yet, by any amount of poverty, hurry, and drudgery all the week through. But it would be a mistake to say she is a child, for

all that. Alas! the poor have but short childhood, or none; and Cinderella down-stairs is one of the old children. Pity her, then, the more; and remember, in her provoking failings, that but for her many lifelong miseries, she would be a child; that she sometimes needs rest, enjoyment, sympathy; and that when any of us come across her, our kind word will not be thrown away upon the poor little ill-starred girl.

We have more sympathy with Cinderella of the kitchen, notwithstanding her tatters and untaught ways, than with her cousins who get a better start in life, as neat little maids in a nursery, or as the last and least in the divided work of a great house, where little country girls, rosy and fresh, fare plentifully in the servants' hall. Cinderella is much poorer, and often much younger; her life is far more laborious, and has less change or considerate treatment; and she is much more humble and grateful, which, after all, makes the strongest claim on our good-will. For Cinderella, though she grows up to be a Susan-Jane, seldom has a chance of becoming one of those upper servants who, in common with the gout and the powder-tax, are among the necessary evils of riches. She will never outrage Society by hinting a taste for blue china, or requesting leave of absence to attend a Language-of-Flowers Bee. She will never irritate us with the boast of the lady's-maid, who capped her list of qualifications by remarking that she had always married-off her young ladies satisfactory. She will never, in dearth of note-paper, offer her mistress 'a few sheets of mine, mum, if you won't mind using my monnygram.' Nor will she imitate that housemaid, with whose description and parting remark Mr Punch frightened the advertising public: the young person applying for a housemaid's situation where a footman was kept, who objected to children, was engaged to and visited by a most 'spectable young man in The 'Orse Artillery, and had a fortnight's character from her last place—but who, not exactly suiting the advertiser, retired observing: 'I really ham sorry, mum, for I rather like your appearance, mum!'

No; Cinderella down-stairs is not of the species from which these awful beings are selected; she is far more harmless and helpless. She is an overworked, unguarded, unloved specimen of those most pitiable of mortals, the Old Children; and, as such, if we think rightly, most pitiable, and sadly interesting. For every variety of the Old Child is interesting, as every one is pitiable. Of course, it is well for Cinderella down-stairs that she has her woman's work to do and her loveless hire to get; her poverty makes both a boon. But it is ill for her—and the knowledge of it marks a blot in our estimate of human nature—that once she gets into her fiddle-case of a canvas apron and bib, no one believes any more how young she is; and she might as well, for all practical purposes, be like Dick Swiveller's Marchioness, a little patriarch in pattens with no idea of her own age.

Farewell, Cinderella! You are one of the necessities of our crowded cities; and after glancing at your unchildlike lot and your unloving treatment, we must leave you where we found you, yourself not, knowing that you have yet the childlike right of your young years to be

considerately taught, forgiven, cared for. Sit down among the cinders. Your sisters are in bright homes, or pleasant school-rooms, or play-rooms noisy with laughter. Or some of them, a little older, are thinking of 'coming out,' dressing guily, driving to the balls and parties to which no fairy godmother will take you, and at which, indeed, if you were present, poor Cinderella, you would be but a sorry figure! This is every-day life, you see, you wizen-faced child of work; there will be no Prince, and no glass slipper; and if you envy your little sisters their kisses, no one is going to be kind to you; and if you have ever heard of the balls to which your big sisters are going, it is presumption in you to need pleasure of some sort too. You are one of the unchildish children growing into womanhood; and the world assumes, by some odd freak of reasoning, that all unchildish children born to work are able to take care of themselves with impish precocity, the moment they have got out of the cradle and laid hold of the broomstick!

NIGHT.

The earth is veiled in twilight gray,
Day wings her flight;
The worshipped sun is borne away
On blushing waves of amber light;
Come then, thou Maid, and be our Queen;
Nought shall disturb thy reign serene,
O dark-eyed Night!

The weary earth mourns not the death
Of busy day;
The sighing wind now holds her breath,
To list to Philomela's lay;
And Night-wood buds, asleep since morn,
Awake, and hasten to adorn
Thy regal way.

'Mid dusky spheres is raised for thee
A throne on high;
The budding stars await to see,
The crescent moon come gliding by.
Then they'll entwine thy raven hair;
And Cynthia on thy bosom fair
Will gently lie.

Love lights his lamp, then steals away
To Psyche's bower;
And Hope, who twines her wreath by day,
Now hides in heart of drowsy flower.
Come, wave thy strange enchanted wand,
In magic circles o'er the land,
From thy dark tower.

I hear the tread of silver feet,
O coming Night!
Thou turnest, like a vision sweet,
The misty darkness into light.
I see thee now, and at thy side
Is gliding sleep—the dreamy-eyed—
Thrice welcome Night!

POPULAR

LITERATURE, SCIENCE, AND ART.

Fourth Series

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 967.—VOL. XIX.

SATURDAY, JULY 8, 1882.

PRICE 1½d.

A SAFE INVESTMENT.

DURING the last two or three years, the attention of our readers has from time to time been called to the question of Thrift, its encouragements and discouragements. With regard to the subject of hospital relief, we have pointed out the weakness of that easy-going charity which gives indiscriminately, and does not pause to consider that to 'help the poor to help themselves,' and to teach them the lesson of making provision for a rainy day, is a far higher boon than any amount of mere alms-giving. The Provident Dispensary, which, it is earnestly to be hoped, will in a great measure supersede our present system of free relief, has the unspeakable advantage of inculcating habits of forethought and of preparation for the future. It is the object of the present paper to deal with a kindred question, which should commend itself to the careful consideration of every thoughtful man.

The subject of Life Assurance is one which has for over a hundred and fifty years been slowly but surely working its way and gaining ground in our midst. Beginning from the smallest seeds in the seventeenth century, it is now a mighty tree, bearing rich and ripe fruits of comfort and help to thousands. It is pleasing to find that in spite of much apparent extravagance and recklessness in our present mode of living, this important subject is attracting more and more popular notice and favour. Yet, widespread as is the interest in this important subject, it is by no means as universal as it should be, for there are indeed few heads of families who can afford to be indifferent to the possibility of making adequate and immediate provision for those dependent upon them, in case of their sudden removal. With the recent memory of such a catastrophe as that at Vienna, it behoves every man seriously to consider the fact as indisputable, that in the midst of life we are in death, and so to consider it that not a day shall be lost in securing wife and children against the bitter sufferings of grinding poverty. Let any father of a family take up

a daily paper and run his eye down the columns of 'Situations Wanted,' and he will find constantly repeated, 'Gentlewoman by birth,' or 'Widow of a professional man,' seeking for means of earning their daily bread as governesses or companions, and often for less wages than they in their prosperous days would have given to their cook; then let him reflect on the fact that in the vast majority of cases this is the sad result of the neglect of the head of a family to make provision for the future, and surely he will see to it that such a cruel fate shall not befall his own dependents.

Still, there are few men worthy of the name who do not mean to make provision for their children at some future time, and who would not indignantly repudiate the charge of deliberately intending to leave them dependent upon charity. Yet to most men, in the poorer and middle classes at anyrate, it is almost an impossibility to make an adequate provision for anything like a large family by means of simply putting aside a portion of their income, and this even where life is spared to its utmost limit. What we hold is, that no man has a right to be in such a position that were he to be suddenly removed, those remaining would be left destitute. Now, every holder of a life-policy for a reasonable sum, has the comfort of reflecting that whatever happen to him, even should he be cut off suddenly and without warning, there need be no crushing poverty and bitter struggle to be added to the inevitable sorrow of bereavement.

The nature and principles of Assurance may be briefly summed up in the old proverb, 'Union is strength;' and put into familiar language, may be termed an association of persons agreeing to do in company, what, to the individual alone, would be an impossibility. In every variety of insurance this is accomplished by each member paying a certain sum annually into a general fund, in which capital becomes gradually productive. This is done on the understanding that at some fixed time each will receive his individual share with whatever of

interest and profit may have accumulated. In the case of Life Assurance, this fixed time is the time of death, and the sum insured becomes in the majority of cases a last legacy of love, to cheer the hearts of sorrowing survivors. Nor is there in this, as might seem at first sight, anything of the nature of a lottery; for although as regards the individual, nothing can be more uncertain than the time of his death, as regards any large number of persons nothing can be surer than the average duration of their lives.

This principle of average is by no means confined to the subject of Assurance; for it may safely be taken for granted that whatever event has happened once, will happen again, and in reference to large numbers, will happen a certain number of times in a given period. To take an instance from every-day life. In the Postmaster's annual Report there is always mention made of a certain number of letters posted without being fastened or addressed, and it has been ascertained, in reference to the total number of letters posted in a twelvemonth, that the average of careless senders is similar year by year. In the same way, it has been ascertained by careful collection of statistics, that in a population of a given number, there will be a certain percentage of fires, of railway accidents, and of deaths from stated causes—in short, a certain fixed recurrence of all the ills and changes that flesh is heir to. From this it may be seen that in dealing with large numbers, it needs no magician's spell to read the future with something like certainty; and it is this approximation to certainty which eliminates almost all question of risk or chance in reference to our subject, and makes it safe to reckon upon coming events. Surely he is the wise man who so reckons on the future as to provide for the one event which *must*—not simply may—happen to us all.

Nor is it possible to exaggerate the difference it will make to a man himself and to those near and dear to him, whether he has been content to take as his motto, 'Let us eat and drink, for to-morrow we die;' or whether, looking bravely into the future, he has made such provision as to enable those depending upon him to be at least beyond the reach of want, or better still, to continue their ordinary way of life, should they be left at any time to their own resources.

But, apart from the primary object of making a provision for the future, there are other considerations in reference to this matter of Life Assurance which deserve to be brought forward. It will hardly be denied that of all things which tend to make a man happy and useful, nothing exceeds the formation of good habits—habits that will enable him to possess that greatest of blessings, a healthy mind in a healthy body; and towards this desirable end

Life Assurance gives a decided impetus and help.

In the first place, this act of providing for the future of others is in direct opposition to that natural selfishness which lies at the root of so much of the misery of life. The really selfish man who can see things only through his own spectacles, and who in all he says and does has only the gratification of self in view, is he not also one of the most miserable of men? For of all hard and exacting masters, Self is the most tyrannical, and the least easily pleased. Now, when a man comes out of himself sufficiently to look forward into the future for the sake of others, he is surely taking a step in the right direction towards unselfishness and happiness; for it is a distinct law of our nature that these two things shall go together; and if you want to find a truly happy man, look for one who forgets himself in thinking of others. This habit of unselfishness is, to say the least, likely to be encouraged by the keeping up of a life-policy; for it is not a single action performed on the spur of the moment and done with, but a thing to be remembered and provided for; and as each annual payment becomes due, the man is reminded afresh of the fact that he does not live for himself alone, and that he has certain duties in relation to others which he, and he alone, can fulfil.

Another point in connection with this yearly payment is the strong impulse it gives to the cultivation of habits of forethought, economy, and sobriety. In most cases, where the life is assured in a fair proportion to the income, there will need to be some careful looking forward and arranging of ways and means, in order to be able to lay aside the needful sum. And to this end there must be an exercise of that wise economy which is a blessing alike to rich and poor. Unhappily, this virtue is far too rare amongst us as a nation. It is perhaps most palpable in the case of the working-man who eats and drinks away his money whilst he has work, and then starves in the time of enforced idleness. But though most palpable here, it is no worse than the case happening constantly in the class above the labouring, where the object in life is to pass for being richer than is the fact, and where the earnings of the husband are spent in efforts to outshine the neighbours. The same folly may be seen on every hand, and anything that has a tendency to check this spirit, and to make income and expenditure accord, should have a hearty welcome.

Again, amongst the lower classes especially, the cause of half the misery to be met with is in that terrible want of sobriety which spreads ruin and desolation wherever it is found, and in the train of which follows the gloomy list of dishonesty, cruelty, and crime of every kind. Of those who fall under this sad temptation, a very large percentage are led astray through simple carelessness and want of thought. A young man earning good wages sees no reason why he should not do as he likes with his own, and forgets the fact that 'habit becomes second nature,' and cannot be laid aside at will and without a struggle. Now, it is an obvious fact that anything which tends towards making a man

steady and thoughtful, will have a most salutary effect in checking the formation of habits which, merely idle and careless at starting, have in them the germs of every sort of sin and crime. Surely, to face the future in such a manner as to induce him to provide for it on behalf of those who shall be dependent upon him, will help a man to study economy and thrift, and to shun a course which, at the very least, will drain him of his hardly-earned money, and will give him no chance of preparing for a rainy-day.

Another of the incidental benefits of Life Assurance, and one to be by no means passed over lightly, is its tendency towards the strengthening of those family ties which so greatly sweeten life, and make so sacred the associations and endearments of home.

It is a natural and right instinct which makes us desire the respect and love of those about us, and the man must have sunk low indeed who would deliberately act in such a manner as to lower himself in the eyes of those who ought to look up to him with reverent affection. Yet what shall be said of those who are satisfied to live only for the present, and who are too thoughtlessly selfish to consider the possibilities of the future for those whom they profess to love and cherish? There are men, by the thousand, who seem to forget the fact that wife and children can think and feel for themselves, and that sons and daughters as they grow into men and women, will see through, and value at their true worth vague promises for the future which lead to no definite efforts in the present. On the other hand, it is scarcely possible to act rightly in this matter without much of benefit in the present, as well as of blessing in the future. They will be strange children indeed whose hearts do not warm towards the parent whose love shows itself in deeds as well as in words; and there are few wives who will not cling with a closer affection to the husband who shows himself anxious that she and her children shall never be left destitute, or exposed to the tender mercies of a world so often cold and cruel.

One other personal consideration well deserves mention, and this is the freedom from anxiety which security as to the future brings. There is no more prolific source of premature old age and death than the habit of worry, which in this competitive age is rather the rule than the exception. When to the inevitable anxieties of business is added the ghost of a future unprovided for, it is little wonder that body and mind sink under the strain, and that scarcely a day passes without its addition to the records of insanity and suicide. In how many cases might the reason and health be preserved, were it only the present difficulties that had to be met, and were there no need to live up to such high pressure, in the hope of being able to provide for the future! Of course, the mere fact of being insured will not save a man from the inevitable cares and anxieties of life; but what we maintain is, that it will save him from a burden which is otherwise almost too heavy to be borne.

In a further paper, we may speak of insurance under another aspect, in reference to the community at large, and show its decided influence in stimulating the productive industry of a country, in reducing the poor-rates, and in lessening the

cost of prevention of crime. Meanwhile, we trust that enough has been said to commend the subject to the serious consideration of the thoughtful and unprejudiced reader.

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

CHAPTER XXVI.—‘MY DEAR,’ SAID THE OLD LADY, ‘YOU ARE FRETTING ABOUT SOMETHING.’

To Constance's mind, Val's precipitate flight spoke only of a longing and a despair which had grown unendurable. She saw him fighting for honour's sake, flying all he held dear, and going away into a void world which had no chance of solace for him. The true and honest ring of the old cavalier's verse was in her mind, with a meaning in it which was new to her, because she felt it echoing in fancy from her despairing lover's soul:

I could not love thee, dear, so much,
Loved I not honour more.

He had fled for honour's sake; and for that, though it wounded her sorely, she half deified him. Once before—as she knew—he had struggled to escape her charm, and had failed. She had trembled to think of that; yet where on earth is the woman who would not have been pleased by so magnificent a compliment? When she could escape from Reginald's presence, she fled to her own room, and cried to think of Val and his love and courage and forlornness. He proved his love by running away from her, and with a rare magnanimity, trusted to her to understand and forgive; nay, perhaps with a magnanimity rarer still, trusted to offend her by the *brusquerie* of his departure, and so turn her heart towards Gerard once again. We who are behind the scenes, and know the course of circumstances which dictated Val's flight, can scarcely share her exalted notions of his delicacy, his honour, and his courage. But howsoever mistaken she might be, her thoughts of him were valuable to herself. ‘He helps me back to the path of honour,’ she said, even while she wept his departure. ‘I am pledged to Gerard, and I must be true to my word. I must try to love Gerard; that is my only real safeguard.’ Poor girl! When did ever love go forth in answer to commandment? Yet there was this help—that Val had put a distance of real reverence between them, and obviously meant to return no more until he could return in safety. She was proud, and she was pure-minded, and purely bred, and habits of thought and feeling are strong things even when assailed by the Passions. She would not scorn herself so far as to fancy that if once she were safely married to Gerard, any man could move her to one unfaithful or regretful thought. And now she began to long for that union to which she had looked forward hitherto either with coldness or with shrinking.

No word from Gerard. She besieged herself with questions as to the meaning of his silence, and could find no answer. Her lovely cheek paled with the inward conflict; and Miss Lucretia, who knew of nothing but happiness in her fortunate niece's lot, must needs send for a doctor, who prescribed a tonic. Constance

submitted, but left his medicine untasted; and Miss Lucretia remonstrated, and had terrible visions of a premature grave for her beautiful niece.

'My dear Constance,' the old lady said at length, being fairly frightened by the girl's languor and want of appetite, and the pallor which had taken the place of her late lovely bloom, 'I must insist—I really must insist upon your taking the mixture.' She poured out a dose, and advanced with it, bearing the wine-glass in one hand, and in the other, daintily held between finger and thumb, a lump of sugar. Constance, too languid to resist, accepted the medicine, but refused the sugar. She had almost lost all sense of taste in her two or three days of illness, and the nauseous bitter scarcely existed for her. Then, being in a mood so tender and sore that all the fibres of heart and mind seemed raw, she began to cry a little at her aunt's caresses. 'My dear,' said the old lady with sudden decision, 'there is something on your mind. You are fretting about something.' Constance peevishly repudiated this idea. Her temper, naturally even and coldly sweet, had within the last day or two grown sickly and uncertain. 'My dear,' repeated the old lady, with gentle but firm insistence, 'there is something on your mind. Did you expect—*him* to follow you to town?'

'I don't know,' said Constance. 'I am not fretting. I am not quite well. That is all.'

'No, my dear,' said Miss Lucretia, with chirpy firmness; 'that is not all.' Miss Lucretia was one of those dear old ladies who are slow to receive ideas, but who having by any process absorbed them, hold on to them with marvellous firmness. 'You are fretting.'

'You are very unkind,' retorted Constance, who was made more miserable by the fact that she could not honourably confide in anybody, and so allowed her misery to recoil in anger. But she was so palpably unhappy, that Miss Lucretia would not be angry in turn. She only put her withered arms about the beautiful neck, and in spite of a feeble resistance, drew her niece's head to her old bosom and swayed her to and fro a little. 'I am ungrateful and wicked, dear aunt,' sobbed the girl, easily melted by this voiceless caressing patience. 'You are not unkind, are you, dear?' And she looked up with violet eyes full of penitence.

'Why should I be unkind to anybody who is in trouble?' asked Miss Lucretia, still clinging to her point, and seizing the chance of putting it forward again. 'I have suffered, and I can sympathise with suffering. Tell me what is the matter.' Miss Lucretia was very sentimental, as tender-hearted old maiden ladies mostly are, and she had a wonderful scent for a love-trouble. Now, 'Ask me no questions and I tell no lies,' is not a proverb of the lofty sort, but it yet holds a word of warning for those who care for wisdom. If you will insist on having the confidence of one who is unwilling to impart it, you ought not in charity to be too amazed if a half-confidence is imposed upon you, or even if you are set upon a wrong scent altogether.

'He might have written,' murmured Beauty in distress, suddenly grown double-faced. Miss Lucretia applied this stricture to the conduct

of Gerard solely, though, as a matter of fact, in Constance's mind it slid between him and Strange, and was aimed at once at both, and neither.

'Is that all?' said Aunt Lucretia. 'You little goose!' She kissed her fair burden patron-like, almost protectingly. The epithet 'little,' addressed by Miss Lucretia to Constance was droll. Constance, even whilst labouring under a sense of her own duplicity, smiled furtively. 'My dear,' said the old lady, 'young gentlemen have so many things to think of. And did you not tell me that his father had announced his desire to make arrangements for your future? I have been making inquiries, my dear, and Mr Chichester, who knows a great many City people, assures me that the affairs of Lumby and Lumby are colossal. That was his word, my dear, not mine. Colossal. Now, if the affairs of a House are justly to be described as colossal—and I can repose the most implicit confidence in Mr Chichester, who would not exaggerate for the world—it will necessarily be a matter of time to make the arrangement which Mr Lumby suggests; and Gerard is probably quite absorbed in business, and is waiting until he can lay everything before you.'

This explanation was so satisfactory to Miss Lucretia, that she dwelt upon it at considerable length, the fact that Lumby and Lumby's affairs were colossal appearing to afford her the warmest gratification. Constance was too glad to be left alone to interrupt her, and she followed the tangled threads of her own thought whilst the old lady expounded the advantages of being attached to an establishment which was colossal, or, as she added savingly, 'had been so described by one accustomed to the contemplation of large affairs, and not prone to use the language of exaggeration.' So attractive did this theme prove, that Constance escaped all further questioning that night, and made such strenuous efforts to be cheerful, that they resulted in a real headache, which kept her in bed until evening next day, and brought the doctor again. Reginald, calling, encountered the doctor, and asked him what was the matter. The doctor responded in a round-about way, as doctors sometimes will; but he said enough to make it clear that the case was one for which some suppressed excitement was most probably answerable.

'You had best come no more to Jotunheim, Mr Strange!' said young Jolly to himself as he walked away sorrowfully. 'You have done mischief enough already, Val—mischief enough already. Girls are a sad trouble! I shall be glad to see her safely married to Lumby.' Reginald felt a considerable sense of responsibility in this matter, comfortably mingled with a feeling of diplomatic triumph. He it was who had discovered the hitch in affairs and had banished Strange. He felt proud of his own discernment and of the spirit and judgment he had displayed. 'Constance will be getting married in a couple of months or so,' he told himself, 'and Strange will have the good sense to stay away for at least that time. And then Val's such a butterfly fellow! He feels all this very keenly, no doubt; but he'll forget all about it, and as likely as not bring back a gold-coloured bride from the West Indies.' Comforted by these reflections, he walked on

briskly. The shops were lighted up, and the evening sky was clear. The air even in London had a prophetic sense of spring in it. Where do they come from, those wandering faint perfumed winds which sometimes, for a second merely, greet the sense of the wayfarer in London streets, and how do they keep their perfume in their journey through the city's unnamed odours? Reginald was a lover of the town rather than the country, yet the countrified scent greeting his nostrils as it passed, sent him on his way well pleased. Suddenly, in the Regent Street crowd one face flashed out on his, and was gone again. He turned and pursued it, but failed to overtake it. 'Surely that was Gerard!' he said to himself as he passed and cast an uncertain glance before and behind him. 'But what a face the fellow wore! He looked downright ghastly. I hope there's nothing the matter. All his people were well enough. The pace he was going too! Staring straight before him, and plunging on like a madman.' A minute later he smiled, and shook his head with a knowing air. 'Love's a curious fever. He was going up to Chesterfield Street, and had heard that Constance was unwell. I'm getting quite knowing about the tender passion. Wonder when my turn's coming.—No; nothing in your line to-day, Cupid. Call again.' Beguiling time with many naïve reflections, he walked on, and near the top of the Haymarket found himself entangled with a small boy who made proffer of an evening paper.

'O'ny a 'a'p'ny,' said the small boy appealingly, shivering before him as he walked on. 'Terrible disaster at sea, sir. Orful failure in the City. O'ny a 'a'p'ny!' The words 'failure in the City' struck curiously upon his ear, and Gerard's face, seen ten minutes before in Regent Street, came back to him in ridiculous association. He bought a paper chiefly to dispel that absurd fancy, and unfolded it near a tobacconist's window. There he read in large letters, 'Great City Failure.' The words 'Lumby and Lumby' followed in some connection, but everything had suddenly grown misty, and he could not see. He stood with a chill sickness creeping over him until his sight cleared again, and then read on. 'This afternoon, Messrs Lumby and Lumby, the well-known merchants of Gresham Street, suspended payment. The liabilities of the firm are estimated at half a million.' The street seemed to whirl, and he could not think. He held the rod of the tobacconist's shop-blind for a minute, and then, with uncertain step, went on again. Nothing was clear to him, within or without. The lights in the shops were hazy, like his thoughts; but out of the fog which seemed to have fallen on the streets came the face of his friend as he had seen it but a while ago, white and haggard and desperate. He could read its meaning now.

SADDELL AND ITS LEGENDS.

BY CUTHBERT BEDE.

THERE are still some parts of our country that are beyond the reach of railroads, and are out of the beaten track, and which, therefore, are not much visited, except by those who go thither chiefly for the purposes of sport. One such tract of country comprises the whole of the south-western Highlands of Scotland, south of

Oban, the 'Charing-Cross of the Highlands.' Throughout Argyllshire there is no railroad. MacCallum More's territory and the Land of Lorn are not invaded by parliamentary and excursion trains. The country of Ossian and of the children of the mist knows not the roaring and panting of the iron-horse as he drags his carriages past mountain and loch. It is true that hundreds of tourists annually cross the northern neck of Argyllshire by the Crinan Canal; but that is a voyage by water, and they only get a glimpse of a small portion of the wild scenery of this most picturesque county. To get a sight of its southern portion—especially of the long peninsula of 'wild Cantire,' as Sir Walter Scott calls it—the traveller must take the long steamboat voyage from Greenock down the Clyde, round by Arran, and through Kilbrannan Sound, to Campbelton; whence he must get to his destination, or shooting-quarters, as best he may.

Sailing down Kilbrannan Sound, with the rugged peaks of Arran on our left, and on our right the bold range of Beinn-an-tuir—'the Wild-boar's Mountain,' and the scene of the death of Diarmid, the Fingalian Achilles—we come within eight miles of Davar Island and the entrance to Campbelton harbour. Here, on the Cantire shore, and close to the water, we see a massive quadrangular castle, backed up by woods and hills, and in excellent preservation. This is Saddell Castle. It stands near a river which flows through Glen Saddell; and in the hollow of the Glen, close by the river, and surrounded with trees, is the once-famous Monastery of Saddell, now a mere ruin.

Legends gather around Saddell, like the moss and lichens on the remaining stones of its Monastery; and these traditionary tales, or *Sgeulachdan*, are told in the native Gaelic, on many a winter's night, around the peat-fire in the black-roofed heather-thatched hut, while the men and women knit and listen to the stories with an absorbing interest and rapt attention that could scarcely be realised by the average Englishman who reads his *Times* and subscribes to Mudie's. It is with these legends that I would chiefly deal.

The very name of Saddell may be said to come down to us clothed with legendary lore. There is a tradition concerning the building of the Monastery. A certain person having murdered his step-father, was constantly haunted by the ghost of the murdered man, and could gain no rest or peace of mind. He therefore travelled to Rome, in order to confess his sin to the Pope, who ordered him to return to Cantire, and there build a church between two hills and two waters; after which his troubled mind would be relieved. He made choice of Saddell, which fulfilled the conditions imposed upon him for the site; and there he built the famous Monastery. This tradition may perhaps have arisen from what is told of Donald, grandson of Somerled; how he went to Rome to obtain absolution for his sins, and on his return gave rich gifts to Saddell Monastery. Another tradition says that the founder sent to Rome for some consecrated dust, and made the building commensurate with the extent to which the dust could be spread.

This founder was 'the mighty Somerled'—who is mentioned in Scott's *Lord of the Isles*—Thane of Argyll, and Lord of Cantire and the Isles. He was slain in fight in the year 1163, and was buried in the unfinished Monastery, which was completed by his son Reginald, who, in addition to his other titles, assumed that of King. The Monastery was designed for the Cistercian or Grayfriar order of monks. In the Norwegian expedition, in 1260, against Alexander III., when Haco was at Gudey ('God's-isle'), now called Gigha, in the Atlantic, off the western shore of Cantire, it is told that an abbot of a monastery of Grayfriars waited upon him, and begged protection for their dwelling and church; which the king granted to him in writing; and not only so, but, when one of his own monks, Friar Simon, died in Gudey, they carried his body across the water to the peninsula of Cantire, and crossing its mountain-range, bore the corpse to the eastern shore, where the Grayfriars buried it in their church at Saddell, and spreading a fringed pall over his grave, dubbed him a saint.

The plan of Saddell Monastery took the form of a cross, lying in an exact position towards the four cardinal points. Its length from east to west was one hundred and thirty-six by twenty-four feet; and of the transepts, from north to south, seventy-eight by twenty-four feet. Part of the gable of the transept, and the aperture for a window in that wall, remain; but the dressed stonework of the windows has all been taken away, with the exception of a single stone near the spring of the arch, which has a moulding of fourteenth-century work. The monumental memorials are numerous and interesting; for distinguished persons from all parts of the country had their sepulchres here, including some of the collateral branches of the Macdonald clan. The tomb that is pointed out as that of the mighty Somerled, is in the choir, and appears to have been originally placed within the arched recess, or founder's tomb, in the south wall of the choir, near to which it now lies; and this supposition is probably correct. If so, the sculptured effigy of this redoubtable Lord of Argyll and the Isles represents him as wearing a high-pointed, conical bascinet, from which the camail, or tippet of mail, is dependent over the neck and shoulders. The body is clad, down to the knees, with the shirt or jupon, which is scored down with straight lines to represent the folds. The right hand is raised up to the shoulder; the left clasps the long two-handed sword. In the corner of the slab, above the right hand, was an inscription, now defaced and illegible.

Another tombstone, bearing the figure of a warrior, is said to be that of Mackay, to whom Robert Bruce assigned the lands of Ugadale and Arniele, in Cantire, for giving him shelter when he was a fugitive. Bruce had wandered to Mackay's farmhouse, where he was entertaining some friends, and at first declined the hospitality; but Mackay compelled him to accept it, saying: 'I am king in my own house.' The next morning, after breakfast, Mackay took Bruce to the top of the mountain of Beinn-an-tuirc, to show him the western coast, whither Bruce wished to go. Bruce then disclosed himself, and said he would give Mackay what he wished, when he had

regained his throne. Mackay asked for the two farms of Ugadale and Arniele; and they separated at the spot now marked by a stone called *Crois Mhic Cairdh*, or the Cross of Mackay. After the battle of Bannockburn, Mackay went to Edinburgh, where the king gave him the title-deeds of the two farms; and when Mackay declined the goblet of wine that he offered him, Bruce in his turn said: 'You must drink it; for I am now king in my own house.'

There is also the grave of Archibald Campbell of Carradale, who was killed at the battle of Inverlochy, while engaged with the forces of Montrose. Here, too, lie Macdonalds and other distinguished men, whose graves cannot now be discerned from those humble mounds beneath which 'the rude forefathers of the hamlet sleep.'

The West Highland funerals were attended by a great concourse of people, and unseemly scenes not unfrequently occurred on these occasions, arising out of the jealousies and hot blood of hostile clans. I was told that early in the last century, when a funeral was being held in this graveyard, one of the proprietors of Cantire, pointing to the grave of the great Macdonald, exclaimed: 'There lies the bloody dog!' Upon this, the Macdonalds who were present drew their weapons, and would have slain the gentleman, had not his servant protected him and got him on his horse, when he galloped away for his life.

On a bank on the other side of the river is the Holy Well, almost concealed by long grass and coronals of fern. The water flows into a small stone basin, on the front of which remains a sculptured cross, the only one belonging to the conventual buildings that has escaped destruction. It is placed in a scene of singular beauty, and possesses the customary Holy Well legend—that those who drink of its waters should wish a wish, and will be married to their hearts' desire before another twelvemonth has passed over their heads. But two peasant maidens whom we saw there, were too young for any such flights of fancy, and had merely come to the Holy Well for the prosaic duty—made poetical by place or circumstances—of filling their pitchers with the clear spring water. As yet, they walked in maiden meditation, fancy free of any bridal of Saddell that might hereafter be their lot.

It is said of Reginald, who completed the building of Saddell Monastery, that, in conformity with a practice among the Scandinavian sea-kings, he did not enter under the roof of any house wherein a fire was kindled, for the space of three years; and he thus accustomed himself to hardships and privation. The rents of the Macdonalds of Saddell, as was then the universal custom in Scotland, were chiefly paid in kind—meat, meal, malt, cheese, poultry, &c.; so that, in the year 1542, the monetary rent-roll of Macdonald of Saddell, Lord of Cantire, and also Lord of Islay and Rheinds, barely amounted to one hundred and forty pounds sterling. But the Macdonalds were very generous, and would occasionally reward one who gave them a night's lodging with the grant of a farm; indeed, that of Coul, in Islay, was granted to a man who had given a flounder to a Macdonald who was much exhausted. These grants were models of brevity, as may be seen from two specimens: 'I, Donald, chief of the Macdonalds, give here in my castle to Mackay,

a right to Kilmahumay, from this day till to-morrow, and so on for ever.'—'I, Donald, sitting upon Dundonald, give you a right to your farm, from this day till to-morrow, and every day thereafter, so long as you have food for the great Macdonald of the Isles.' Dundonald was the castle near to Campbelton, on the western coast, where Macdonald went to receive his rents; and the cliff close to it is called 'The Hangman's Rock,' where, perhaps, short treatment was made of those who were behind-hand in their payments; for some of the Macdonalds of Saddell were very rough and ready in their ways—that one, for example, who used to watch from his battlements, and take 'pot-shots' at any passer-by, using a gun that he called 'the Cuckoo.' This chieftain, who was known as Rìgh Fìongal, went to Ireland, and, by force, brought back the wife of another man, who followed him; but who was imprisoned by Macdonald in Saddell, with the intent of starving him. First, he was shut up in a barn; but he sustained life by eating some grain. Then he was moved to another out-building, where a generous hen laid an egg for him daily. Then he was put in the dungeon of the castle, and died, after gnawing his arm and hand. Macdonald gave him a funeral, and told the widow what had happened; but she leaped from the battlements, and was buried with her husband. Then three Irish friends came over, and were hospitably received by him; but when he found them asleep in his barn side by side, with their necks convenient for his long sword, he cut off their three heads with one swishing blow. He then invited M'Lean and the chiefs of his clan to enjoy his hospitality at Saddell, and cement the peace that had just been made between the two clans. But he thrust them all into dungeons, and each morning, after breakfast, cut off the head of one of them. The king of Scotland heard of this, and interfered in time to save the necks of a few of the Macleans, by ordering Macdonald to come before him at Ceann Loch—as Campbelton was then called. He obeyed the order, and swore allegiance to the king; but before his monarch had sailed out of sight of land, Macdonald hoisted a flag of defiance.

One story is told in connection with Saddell Monastery, of the love and heroism of a young girl who was servant to a farmer in Barr Glen, which is on the other side of the mountain of Beinn-an-tuirc, and about seven miles from Saddell. This girl was loved by the farmer's son; but his father disapproved of their courtship; and with a base scheme to get rid of her, told her that he would give his consent to the wedding, if she, on that dark, tempestuous, snowy winter's night, would walk across the hills to Saddell and bring from the old monastery a skull that lay on the founder's tomb. She consented, and went out alone on her perilous journey; and in the morning, returned half dead with fatigue and excitement, but with the skull in her hands. The old farmer would not believe the tale that she told concerning the skull, or that she had brought it from the Monastery. She said that when she had at last got to the old church, she found its door open; that she groped her way in—well knowing the spot and the position of the tomb—and that

she heard mysterious moans, and the movement of many light feet and forms all around her. Terrified, but not disheartened, she made her way in the darkness to the old tomb, felt for the skull, seized it, and carried it away, pursued by the invisible forms to the church door, which she passed through and closed behind her, hearing, as she did so, a rush made against it. How she got back through the snow to Glen Barr, she scarcely knew; but she accomplished the task; and there she was with the skull in her hand, to claim her reward. Still, the old farmer would not believe her; and set out to Saddell with some of his men, expecting to find the skull in its usual place. But when they got to the old church and opened the door, there, within the building, were a number of deer, who had probably sought shelter from the violence of the winter-storm, and whose startled movements were what the brave girl had heard. And as there was no skull on the tomb, the old farmer was compelled to return home and give his consent to the girl's marriage to his son. They took back the skull to its former resting-place, and were married; and some of the deer were killed and cooked, and they had venison for the wedding-feast.

Macdonald of Saddell was crowned King of the Isles in the chapel of St Columba, on a small island in Loch Finlagan, Islay, where also was a castle, and a harbour with piers and gates to secure the shipping. He stood to be crowned on a large stone seven feet square, and received the sword and white wand of power. Five hundred chosen men formed his body-guard, and out of these there were sixteen picked men to attend him. It is said that a man of great strength, named Macphail, was splitting an oak-tree, when Macdonald approached with his sixteen attendants. Macphail appealed to them to lend him a helping hand; whereupon eight of them took hold of the split on the one side, and eight on the other. Then Macphail suddenly took out the wedges, and the two sides of the oak sprung together and imprisoned the thirty-two hands. Macphail, according to the legend, permitted Macdonald to go away; but he cut off the heads of the sixteen attendants with his axe.

The chief portion of the old castle of Saddell is a square-built tower, measuring in width about seventeen yards by ten, with a height of about fifty feet. The walls are of great thickness, and are without buttresses; but the summit is embattled and machicolated, with projecting turrets—also machicolated—at the four corners, and a fifth nearly over the chief entrance on the western side. The lower part of the castle has two barrel-vaulted rooms pierced exteriorly with narrow arrow-slits; and above these is the principal apartment, having at its north end an arched fireplace ten feet in width. Higher still, are two other floors of rooms, reached by a winding staircase, which is continued to the embattled parapet. The castle was inhabited by the Campbells until the latter part of the last century, when the House was built on the other side of the river, on a somewhat bleak spot, but commanding fine views of the shores of Cantire and Arran, and of the distant ocean.

On the small island of Freughilein, in the

Sound of Islay, was another castle, that of Claig, where the Macdonalds kept their prisoners; and another small island was called the Island of Council, where the thirteen judges sat and decided the frequent disputes among Macdonald's subjects.

An angry threat used in Cantire was, 'Dog on you!' or 'Dog and cat on you!' and it is said to have had its rise in the days when the Macdonalds used bloodhounds to hunt escaped prisoners. Wild-cats, according to the Rev. John Macfarlane of Saddell, might be met in the wooded glens at Saddell as late as the year 1843. I was told a story by an aged native of Cantire that bears upon this. 'In the year 1689,' he said, 'my great-grandfather, MacNiven, joined the Scottish Regiment at the age of eighteen, and was sent to Londonderry, which city was then lying under siege by King James II. The sufferings of the people inside the walls were terrible, and many of them perished from hunger. But although the old man my ancestor was upwards of eighty years old when he died, and had many tales to tell of that dreadful siege, and of his many adventures and fightings, yet he always said that he had never felt half so much terror in the thickest of the fiercest battle, as he had felt in combating with a wild-cat. It was on his return to Cantire from the wars, after King James had been defeated by the Prince of Orange at the Battle of the Boyne, and he had got as far on his way home as Alt-na-beiste—"the Glen of the Wild Beast"—at Saddell, and had reached the stream, which in those days was not bridged over; but there were large stepping-stones placed in the river for the use of the people in crossing. Well, he had stepped upon the first stone, when a very large wild-cat leaped out of a thicket on the opposite bank, and stood upon a stone on the other side of the stream, fully prepared to dispute the passage. The soldier also prepared himself for the combat by rolling his plaid around his neck and taking his dagger in his hand. The cat watched his movements with glaring eyes; and as MacNiven could not safely retreat, he resolved to advance. This he did, cautiously stepping from one stone to another, in order to secure a firm foothold, if the cat should spring upon him; and he kept his dagger ready to strike. He had hoped to thrust the creature through at the first blow; but quick as he was, the cat was quicker, and sprang upon him so suddenly and with such force, that he lost his balance and fell into the stream, with the wild-cat fastened on his neck. It was well for MacNiven that he had taken the precaution to wrap his plaid there, or the creature's bite might have been fatal. It never loosened its hold as they toppled over into the stream; and as they rose to the surface, it made a dash with its sharp claws at the soldier's eyes. MacNiven received it upon his left arm, and immediately thrust his dagger into the wild-cat's body. The stream was rapid, and reached to his chest, and it was with much difficulty that he could stand firmly on the rocky channel. He tried to hold the cat under the water, but could not succeed; and although he wounded it more than once, yet it contrived to keep its hold about his neck and shoulders, fighting fiercely at him with its sharp teeth and talons, and uttering the most terrific cries. The fight was as fierce as it was prolonged; but at

last it was over, and ended in favour of the soldier. He brought its body home, and had its skin preserved. It was as large as a biggish dog; and I have often seen it, and heard my father tell the tale that has been handed down in our family, how MacNiven's direst enemy in battle had been a wild-cat.'

THE FISHERWOMAN OF HONFLEUR.

A TALE OF THE FRENCH COMMUNE.

IN FIVE CHAPTERS.—CHAP. II.

ANTOINE, having, as already mentioned, remained at home for some months after his marriage, at length sailed once more on the long fishing-cruise to the North Sea, which usually occupied a period of six months.

At this period the terrible war between France and Prussia was raging furiously. Paris was already threatened with siege, and the Germans were everywhere victorious. But of all the communities in France, the fisher-folk least troubled themselves with political affairs. Not that they were unpatriotic, for they heartily wished success to the cause and arms of France; but the French fishermen enjoy immunity from the military conscription—to which all other classes of the people, save the clergy, are more or less subject—on consideration of their being bound to enroll themselves in the national navy whenever their services are required.

So long as Antoine remained at home, Lucien had held himself aloof from Madeleine, who believed that, now she was married, he would cease to annoy her. She did not, therefore, think it worth while to cause uneasiness to her husband by acquainting him with the young man's previous ill conduct towards her. But no sooner had Antoine gone to sea, than Lucien recommenced his insulting importunities. He endeavoured to gain her favour by means of costly presents; but his presents were scornfully rejected, and he was plainly assured that if he did not forthwith cease his annoyances, she would take such measures to put an end to them as would give him cause for regret for the remainder of his life.

Thus compelled to desist from his persecutions and to relinquish his base designs, Lucien became more determined than ever upon revenge; and though he could conceive of no scheme at present by means of which he could carry his craving for vengeance into effect, he resolved to wait and watch his opportunity. 'Everything comes to him who has the patience to wait,' he muttered to himself as he returned, raging with disappointment, to Paris.

But then came the siege, and for months he was imprisoned within the ramparts of the city, and Madeleine hoped and believed that she had rid herself of him for ever. At length the siege was raised. The Prussians marched in triumph into Paris, and the war came to an end. The Imperial power was overthrown; a Republic was proclaimed; and the vile mob and *canaille* of Paris sought to establish the power of the Commune, and succeeded for a while in maintaining a second Reign of Terror, during which pillage and murder were rife, and destruction was wrought upon many of the public buildings that

the Prussian guns had spared. But though the headquarters of the Commune were in Paris, it had its supporters in other places, and especially in the towns situated on the banks of the Seine, between Paris and Havre de Grâce. In all these places its emissaries were active in seeking to persuade the poor, debased, and ignorant among the population to join its ranks.

And now Lucien Pierrot was again seen in Honfleur. He had at length worn out the patience of his father, whose eyes had become opened to his son's delinquencies, and, for the time being, the young man was paternally discarded. It was said that, out of spite, to annoy his father and gratify his own evil propensities, Lucien had leagued himself with the Commune, and had become one of the most active among its minor leaders. At all events, he was constantly to be found busily disseminating its atrocious doctrines; but persons who professed to be better informed in the matter than others, declared that Lucien Pierrot was in reality a paid government spy.

It was at this period that Antoine again came home from sea. He had been absent longer than usual, but had made a profitable voyage to various ports in his own lugger. Moreover, shortly before her husband's return, Madeleine had given birth to a son, which delighted the heart of the worthy young sailor. Little did he or the people of his native village trouble themselves about the Commune; probably few among them knew the meaning of the word; and so long as they were healthy and prosperous, it concerned them little whether France was an Empire or a Republic.

On the first day of his return, Antoine was seated, in the evening, opposite his happy young wife—now so proud of her maternity—in their snug little cottage, with the infant sleeping quietly in his cradle between them. Antoine had related the events of his voyage, and Madeleine was acquainting her husband with all that had occurred in the village during his absence, when suddenly rising from her chair, she approached a *buffet*, and took from a drawer a letter bearing the Paris postmark, which she presented to her husband. 'In my joy at seeing thee again at home, my Antoine,' she said, smiling, 'I had well nigh forgotten this letter, which I received a fortnight ago.'

Antoine took the letter from his wife's hand. It was rather a strange and suspicious-looking document—so at least thought the young fisherman. It was weighty, and bore a huge red seal, which was unbroken.

'Thou hast not opened it, my Madeleine,' said Antoine, who had rarely before in the course of his life had a letter addressed to him, and who looked upon it with something like alarm in the expression of his countenance.

'Nay, my husband. It is directed to thee,' said Madeleine. 'I had no right to open it without thy permission.'

'But thou knowest I cannot read,' said Antoine. This was true; the young fisher-lads had to work from so early an age that few of them could read or write. The girls were, as before remarked, better educated.

'If thou wilt, I will read it for thee,' Madeleine replied.

The portentous seal was broken, and when the

letter was unfolded, a piece of folded parchment fell from it on to the table.

Madeleine proceeded to read the letter aloud. It was nothing very alarming after all. It was written by an *avocat* in Paris, who informed Antoine, that through the decease of one Marie Lupin, at the advanced age of eighty-nine, he had inherited the sum of fifteen thousand francs, bequeathed by will to her grand-nephew Antoine Duroc, by the aforesaid Marie Lupin; and that it was desirable that he, Antoine Duroc, should come to Paris at an early day to receive the money, which was in the hands of the *avocat*.

'Fifteen thousand francs! It is quite a fortune, my husband,' cried Madeleine, laying the letter aside, and opening and reading the inclosure, which was merely a copy of the will. 'Our little Antoine will some day be a rich man,' she added, glancing lovingly at the sleeping infant.

'Marie Lupin!' exclaimed Antoine. 'It must be my old aunt Marie, whom I have never seen in my life! It is strange that she should leave me anything. Only think, my Madeleine, fifteen thousand francs!'

'But must thou go to Paris, Antoine, and thou but just returned to me?'

'I'll occupy but a few days, ma petite,' replied Antoine, who had never visited Paris, and though loath to leave his young wife even for a day, was pleased with the idea of seeing the great city.

'But just now, Antoine, when 'tis said there is such dreadful trouble in Paris?'

'It will not concern me, Madeleine. I shall return to thee as soon as I have received the legacy.'

Madeleine was much troubled; but it appeared necessary that her husband should do as the *avocat* requested, and she thought it would be wrong on her part to object to Antoine's undertaking the journey.

Two or three days afterwards, the cargo having been discharged from the lugger, and sold by auction in the fish-market, and the vessel having been left in charge of the mate, Antoine set forth for Paris by railroad, his wife, up to the moment of his departure, entreating him to take great care of himself, and to hasten back to her as soon as possible.

By this time the Commune had nearly run its destructive course. The newly established Republican government, with M. Thiers at its head, had been terribly frightened at the excesses of the Communists, and had resorted to dreadfully severe measures for their suppression. To be suspected was to be denounced and condemned; the government spies were active, and it was said that many innocent persons were punished along with the guilty. Lucien Pierrot, who had been on a visit to Honfleur, chanced to return to Paris on the same day on which Antoine took his seat in a railway carriage for the first time in his life—Lucien travelling by the same train. Unobserved by either, he had witnessed the parting between Madeleine and her husband, and wondered greatly what was the object of the young fisherman's visit to the capital.

To Antoine, Lucien was a perfect stranger; but Lucien would have recognised the features of the young fisherman even if he had not

witnessed the parting scene between the husband and wife. Burning with a desire for revenge, he resolved to keep watch over the young man on his arrival in Paris, and if any opportunity for wreaking vengeance upon him should present itself, to take advantage thereof.

The train duly arrived at Paris; and the two young men passed out of the *depôt*, Lucien following close behind Antoine. He observed the young fisherman apparently asking directions, as a stranger, from several persons whom he met; and saw him, after he had wandered about for some time, looking around him with the wondering air of a provincial who has visited a great capital for the first time. Finally he tracked him to the *bureau* of an *avocat* in the Rue du Faubourg St-Antoine. Wondering more than ever what could have brought the young fisherman thither, Lucien remained on the watch till Antoine, in the course of half an hour, reappeared, accompanied by a clerk, who conducted him to a small hotel near by, to which he had been recommended by the *avocat*.

It was already late in the day; and believing that the object of his animosity was safely housed for the night, Lucien left the spot and went about his own affairs; but at an early hour next morning he stood opposite the hotel, and waited for the unsuspecting Antoine. Nor had he long to wait, for presently the young fisherman sallied forth, and proceeded direct to the *bureau*, which he shortly afterwards left, apparently well satisfied with the result of his second interview with the lawyer.

Anxious as was Antoine to return home to his wife and child, he would have been something more than mortal if he could have resisted the temptation to look around him in the great capital which he had now visited for the first time. He decided to spend the day in roaming about the city and looking at the grand shops, which displayed treasures such as he had never imagined to exist in the world, and in purchasing some trifling presents for Madeleine and his little Antoine, ere setting forth on his return to Honfleur early the next morning.

ECONOMICAL DECORATION.

BY THE 'MOTHER OF A FAMILY.'

IN my former paper on the subject of household decoration which appeared in this *Journal* (No. 904), I endeavoured to give a few practical hints as to the rejuvenating of old and shabby furniture, and the manufacturing out of trifling materials some of those minor articles of ornament which are certainly not indispensable to the comfort of a room, while they add considerably to its appearance and artistic effect. Since writing that paper, I have been fortunate in one or two further efforts in the ornamental decoration of my drawing-room; and as all has been done in the leisure-time of a 'mother' who has three active little boys to make, mend, and knit for, I trust that many of the young people who sigh enviously for pretty things, and bemoan their hard lot in not having money enough to purchase them, may be induced to try and make for themselves, at very little cost or trouble, many of the dainty trifles which they covet.

Nearly every household in this æsthetic age possesses at least one member who can paint a little in oil-colours. One day the idea occurred to me that, instead of the difficult, troublesome, and expensive process of china or enamel painting, it might be fairly successful if oils were tried for the same purpose. I at once experimented on a pair of ordinary white-ware dinner-plates. On one I painted a large blue iris, on the other a branch of vivid scarlet hollyhocks. They were a great success; so I painted several others in the same way, choosing large bold flowers for my subjects. I also painted a pair of oblong breakfast dishes, with rocks, dashing spray, and a boat or two in the distance. The margin of those dishes I carefully painted over with gold ink, giving them three coats; and now those common-ware dishes form prominent ornaments on the top shelf of the over-mantel, which is described afterwards. On the rims of the plates I glued dark ruby velvet, which was cut to fit them accurately, and after being wired, they now hang on the walls; and no one suspects their lowly origin.

After so triumphant a sequel to my trials, I naturally became more ambitious, and bought several proper *plaques*, on which I painted either a pretty landscape without much detail, or a bit of sea scenery. I have been lucky enough to meet with a joiner who enters into my decorative ideas with great shrewdness; and he, for a very small sum, made circular wooden frames, which I covered with velvet; then fastened the *plaques* securely into their new receptacle by means of pieces of wood glued on, or small nails hammered into the wood so as to retain the plate in its proper position; while a circular piece of brown paper glued over the back forms a discreet cover to the workmanship. An ordinary picture-ring screwed into the frame suffices to hang it up; and thus is formed a handsome ornament, and tangible proof that money is not always requisite to produce what is gratifying to our love of the beautiful. I may say that I use ordinary boiled linseed oil—two-pennyworth from any chemist's will last for months—or copal varnish—one shilling per bottle at any oil-colour shop—as medium for *plaque*-painting; and when once dry, thoroughly dry, they may be washed with perfect safety with warm water and a sponge. Vandyke brown is a slow drier; but a little sugar-of-lead, a very few drops added to the medium, will be found to dry much more quickly.

As few people have either time, means, or patience to expend on enamel-colouring, to them I commend oil-painting on china. Each frame requires half a yard of velvet or velveteen; the wood must be laid on the velvet, which is cut three or four inches larger, in order to allow for covering the sides and on to the back; a circular piece is then cut out rather smaller than the frame, to enable the 'rabbit,' or interior edge of the frame, to be deftly concealed. I cannot here enter into any further minute details as to the home manufacture of *plaques* and their frames; suffice it to say that ordinary glue, not too thick, must be applied to a thoroughly warmed wood; then a free use of a pair of sharp scissors here and there at the sides and back, prevents any unseemly crinkling. The front is necessarily perfectly smooth, and easily laid on.

Any coloured velvet may be chosen ; but ruby or dark claret forms the most effective background, provided it be in harmony with other colours in the room. The velveteen left from frames makes capital pincushions, trimmed with lace, fringe, or gimp, as fancy dictates ; and my clever coadjutor the joiner made me half-a-dozen small wooden brackets, with a shield above the tiny shelf. These I covered entirely with pieces of left-off velveteen, screwed a picture-ring into the top, hung them on nails, and placed a rare old china cup and saucer on each shelf ; and very well they look. The wooden brackets cost but a few pence each, for surely every housekeeper has an old box to spare. The tasteful appearance of the walls well repays any outlay of time or patience to produce those simple designs. Individual taste will readily suggest a large variety of patterns for such brackets ; but they must each have a shield or top as high *above* the shelf as the bracket goes *below* it, or the china loses all its effect.

At each side of the fireplace in the room where all those decorative fancies are displayed, are two ugly recesses. I resolved to improve upon them. I found a long piece of wood, which was sawn in two, for shelves ; a ledge of black and gold picture-frame beading was fastened on the outer edge of each narrow shelf ; the shelves were securely fastened one into each corner by means of a small wooden bracket, which I painted over with ivory black. Thus two neat useful shelves were contrived at very small cost. I soon painted a row of plates for each shelf ; and as the wall-paper did not form an harmonious background, a strip of never-failing velveteen, rounded at the top, to form a graceful background to each plate, and to prevent an ugly straight line, was hammered on with ornamental brass-headed tacks, which may be had at any ironmonger's shop for threepence per dozen ; and now my ugly recesses look quite beautified. A little table in each recess looks inviting, with a small bunch of flowers or an album placed thereon.

For some considerable time I was an ardent admirer of the 'over-mantels' or 'mantel cupboards' which are so much in vogue nowadays, in place of the old-fashioned mirrors, which in former days occupied the post of honour over the chimney-piece. For long I was content to admire ; then the idea crept into my head that surely the manufacture of such an article could not be attended with insurmountable difficulties. The thought of purchasing such a thing did flash across my mind ; but the large prices asked for them quite deterred me from putting that project into execution ; so I must either continue to admire at a distance, or try to make a 'mantel cupboard' for myself. And this I resolved to do.

A large packing-case was called into requisition to provide the necessary material. It would be out of place were I to enter into details of the manufacture of the much-coveted piece of furniture ; suffice it to say that with the aid of a friend who is clever at cabinet and joinery work, a most desirable result was obtained ; and I am now the happy possessor of an elegant, artistic, black-and-gold cupboard, which occupies the entire length of the drawing-room chimney-piece, is four feet nine inches high at the centre, has two small

cupboards filled with old china at each side, each cupboard ornamented with two beautifully turned pillars. About eight inches from the top of the centre-piece, a narrow black-and-gold beading—bought at a picture-framer's shop—is carried along ; and five or six inches underneath the beading is placed a shelf, in order to relieve the monotony of the large black board which economy compelled me to substitute for the mirror which generally forms the centre of the cupboard. 'Black Japan' once more came to the front, and two coats of that served to cover the wood with a brilliant black surface, which formed a capital foundation for gold-ink designs. The cupboards are open, so there was plenty of scope for artistic proclivities. Ferns, leaves, and conventional figures were the subjects chosen ; and when I look at the cupboard, and consider how very small was the outlay of time and money expended on it, I can hardly believe my own eyes. The most expensive item, comparatively, was the turning of the pillars ; the turner charged three and sixpence for doing the eight, but they form prominent ornaments to the cupboard.

I had some finely worked strips of silk canvas. Originally they were a pair of 'braces,' but the kid ends wore out, and what to do with the work, which was perfectly clean and fresh, was the next question. With the help of three broad bands of sage-green velvet, cord and tassels to match, a handsome cushion was speedily contrived ; but the two short pieces left off were a source of annoyance for a long time, till one day the thought of transforming them into 'bannerets' occurred to me. The price asked by Berlin-wool shopkeepers for banneret-stands far exceeded my limited purse. Suddenly I thought that a rustic stand formed of twigs would be unique, artistic, and, best of all, cost nothing ; so I took my boys for a country walk, and we soon had twigs enough and to spare. Two substantial pieces of branch the size required were bound firmly into the shape of a cross ; and on the top of the cross I fastened several small pieces of twig, to look as careless as possible. Apple-tree twigs are far the most suitable for such a purpose ; they are so like 'antlers,' which is the best effect to produce. I glued the crosses each into a round foot which came off an old ottoman, and then painted stands and twigs with the inevitable 'Black Japan.' The strips of embroidery were too narrow, so I crocheted several rows of sage-green silk on each side of the work, painted some stiff cardboard green, tacked the work firmly on to that for a foundation, and then sewed it on to the stand. My bannerets have been so much admired, that several have done me the honour of copying the idea, which is a sure proof that it is a success. Any scraps of work or old lace may be utilised in this way, and our homes brightened and beautified by exercising a little of the skill and ingenuity which every woman possesses.

I had a large supply of twigs left from my design, so I made a firescreen somewhat resembling the shields and Japanese umbrellas so much used last summer. In the first place, I borrowed my eldest son's 'hoop,' a good-sized iron one. Economically the idea was good ; but that talkative young gentleman has made me blush rosy

red on several occasions by informing my visitors that 'Mother made my hoop into that bird's nest.' I covered the hoop with a coarse brown wrapper, bought at a draper's shop for a few pence, then scattered the twigs all over. I tacked them on with twine, to keep them in their places, and made an imitation nest of cotton-wool and feathers, which I carefully glued on in the centre of the screen. Our hens at this juncture kindly laid two or three very tiny eggs, which were brought to me in triumph by busy little fingers, and completed our screen by becoming the inmates of the nest. It is a most useful ornament; for as we always have a 'cold' fire laid, the screen can be removed in a moment; when by the application of a match, a cheerful fire speedily diffuses a warmth and ruddy glow, very acceptable in this fickle climate of ours.

For some time I have had a vague idea floating in my head as to door-panels; but my space for the nonce is quite exhausted, and all further talks about economical decoration must be deferred. My end will have been amply achieved if I have induced any one to try for herself how very readily the simplest materials may be utilised to form articles tasteful and pleasing for one's home and family. Truly, there are trials and sorrows enough in the world, and if we can add to its pleasures and gratifications, is it not worth one's while to try?

A PILGRIMAGE TO CHEOPS' TOMB.

THE re-awakening of a general interest in Egypt, occasioned by M. Maspero's great discovery at Thebes, in conjunction with the recent unfortunate disturbances that have taken place, may serve as apology for adding anything, however small, to the already voluminous literature on the country of the Nile. We shall endeavour to give an account of a day's drive, under the glorious blue of an Egyptian winter sky, to the monuments that stand on the limestone platform of Gizeh.

We have had our first peep at the Pyramids from the walls of the Citadel of Cairo; and have had the same sensations that every traveller experiences when he looks for the first time across the dirty and odorous city to the narrow strip of green, bright with early-springing corn, which constitutes arable Egypt; and beyond this to the dreary sand-waste, where the eye rests upon the pyramids that loom out of the far haze of the Libyan Desert. In order to have a nearer view of these monumental antiquities, we left Cairo in the early morning of a brilliant day, sweeping out in carriage and pair, with *sais* or runner in cleanest of linen garments and richest of embroidered vests, to warn the unwary foot-passenger out of the path of our august progress; over the iron bridge, and along the road which was constructed for the convenience of our Prince and Princess of Wales when they paid their visit to the Pyramids. It is a shady road, with trees well and regularly planted, shutting out a portion of the hot sunshine. It is at times hard work for our poor horses; but the Egyptian driver does not spare the whip; and the wheels

drag heavily through the deep sand, which in places has drifted up over the road from the surrounding desert.

We have been pursued for over a mile by two lithe Arabs, who were picketed at an outpost, to obtain the earliest possible intelligence of the arrival of the legitimate prey of the desert—the Englishman. They are clean enough, these two men, their white linen tunics and trousers almost spotless; how they keep them so, does not appear, for their homes are no better than pigsties. They have been trying all the way along to do a little business in *curios* of suspicious genuineness, producing *scarabei* and *osirides* of undoubted Birmingham stamp from mysterious depths in their tunics, and pressing us to buy; but we are on our guard, and we mention the word 'Brummagem,' which is quickly understood, though the innuendo is slyly deprecated by the grinning Arabs.

Our carriage is at length fast in the sand, so we are compelled to walk the few hundred yards that lie between us and the base of Cheops' great building. Our troubles now begin in real earnest. The birds are gathering thick around their prey. They are swooping down, the halt, the blind, and the lame, over that sandy hill, from the village which lies dirty, dog-infested, and sun-baked almost at the foot of the Big Pyramid. There are fully thirty Arabs about us now, clamouring, voluble and demonstrative, and 'the cry is 'still, they come.' One yells that he is the man to take us into the most hidden chamber, Cheops or any one else ever built—he is indeed ready for anything. Another shouts that he is prepared to run up and down as many pyramids as lie within reach in as many minutes as we choose to name. A constant amount of good-natured chaff goes on amongst themselves.—'Him not the right man, sar'; 'Him let you go, and you fall'; 'Him afraid to go up, sar'—and so on, and so on; this all screamed at the highest pitch of the shrill Arab voice; while beneath this upper stratum of uproar is an under-current, steady and ceaseless in its flow, of demands for *backsheesh*. A few days will serve to steel a very Wilberforce against the begging of the people. As a fact, from the moment of one's leaving one's hotel until one's return, the demand for charity never ceases. Money, money, money! We have heard from a group of little naked urchins, who sat far away from the public highway in the middle of a field, cries of 'Backsheesh, sheesh, backsheesh!' when there existed not the smallest probability of our stopping the carriage and satisfying their craving for coin; nor did they appear to expect that we should, for they remained sitting where they were, screaming to us from mere habit. Sir Gardner Wilkinson has suggested that this is merely the Egyptian's mode of wishing a 'good-day'; but we question whether any traveller will subscribe to this opinion after experience.

Another hundred yards, and the Pyramids tower dark and massive above us with their multitudinous steps, which fatigue the eye to count. Now, we are wading ankle-deep in sand, pushed and pulled hither and thither by a clamouring, bargain-driving mob of swarthy Arabs; and are half maddened by the heat of the fierce sun and the demands for *backsheesh*, till we long

to hit out, were it but to make a breach in the crowd to let in some air. We do our best to strike a bargain with some of the rabble; but it is useless. If we speak to one, another is certain to shout depreciatory remarks as to his ability to act as guide. If we settle upon an especial one to take us to the top of the pyramid, there is immediately an outcry. They are like so many children scrambling for scattered sweets. At length, to our intense disgust, we learn that they are incapable of acting on their own responsibility in the matter. We must await the arrival of the Sheik, who is soon seen coming along as fast as his legs can carry him—a tall, lanky, grizzled old man, brandishing a stick and gesticulating wildly. There is a lull in the storm now; for his advent appears to fill his dependents with wholesome fear; and, moreover, he is not scrupulous about freely using his stick on their shoulders and bare shins. We are admitted to a parley with his Royal Highness, and conclude a treaty with him, under the terms of which he undertakes to provide us with two men to haul us up the pyramid, and one to assist us in the exploration of the interior, for the sum of four francs.

Before, however, we do either, we will take a general view of this grand monument and of its brethren, and try and understand, from what we have heard and read, how these structures were put together. First, let us know then, that the greatest of the pyramids which stand at Gizeh was erected, almost to a certainty, by one Cheops, a monarch of the fourth Egyptian dynasty, but is by no means, as regards the details of its construction, a typical specimen of the Egyptian pyramid. It appears to be rather the highest development of an original form, of which there are innumerable examples to be found for four hundred miles along the banks of the Nile; in fact, so far as the dates of construction can be determined, it would appear that there are still in existence many of an earlier period than this one of King Cheops. For instance, there is a famous example at Sakkara, some fifteen miles from Cairo, known as the 'Stepped Pyramid,' which is considered by authorities the oldest building in the world. So we must leave this particular pyramid of Cheops out of the question for the time being, and understand the general method employed by the early Egyptians in constructing a pyramid.

When a monarch came to his throne, he immediately set about the making of a last resting-place for his royal bones; so his officers and head-masons having chosen a suitable base, they engaged, at merely nominal wages, vast *corvées* of workmen, and forced them to work unremittingly until their task was completed. The first step was to quarry out, at some considerable depth below the surface of the rock, a chamber, from which the architects ran a slanting passage at a certain determined angle with the plane of the surface of the plateau, until the mouth of it opened to the light. The builders then placed a square layer of masonry, some four or five feet in thickness, above the chamber and passage, in such a way as that the mouth of the passage aforesaid should appear exactly at the base of one of the sides. Thus much, and no more, was done the first year of the king's reign. The next year,

a similar but smaller layer of masonry was placed upon the first, so that it formed a high step all round with the lower one. The third year, a third but still smaller layer was placed atop the second; and so on year by year, until the pointed stone crowned the summit. Should the king meanwhile have died before the completion of the work, his body was placed in the chamber, and what his mighty tombstone wanted of being finished, was hurried up.

The building is now in the rough; there is much nice work about it; each side must present a smooth, polished surface, which must receive some beautifully cut hieroglyphics. How is this to be effected? It is a long and troublesome task; but time and labour were of small account in the eyes of the ancient Egyptian; he built for all time. So the first thing the masons of the old world do is to fill up with firmly cemented masonry the angles of the steps, until, if we looked up from the base to the summit, we should find that the sides presented a tolerably even surface, but yet crossed at regular intervals by the sharp projecting corners of the steps. The master-builder is not satisfied with it yet, so he sends his workmen up to the summit, and they commence from there the laborious process of chiselling down the protruding corners, and of afterwards smoothing and polishing, until the sides catch the sun's rays upon a white limestone surface, the brilliancy of which is seen miles and miles away up and down the Nile Valley. When the body was placed in its sepulchre, the passage was sealed up, that none but those who knew the secret should ever find the entrance. This, then, was the method of constructing the ordinary Egyptian pyramid.

But we are paying a visit to a pyramid which is an extraordinary exception to the preceding general law. For some unaccountable reason, except it were from a haughty desire to eclipse all former monarchs in the magnificence of his tomb, the mighty builder of this pyramid extended his first layer of masonry far beyond the mouth of the passage which runs up from the chamber beneath, so that he is under the necessity of continuing the passage at the same angle through the solid masonry, until it opens to the air some distance up the side of the pyramid; and not alone this, but he runs other passages, and constructs other chambers, high up in the depth of the masonry, with a strange and mysterious unity of design that completely baffles modern archaeologists. And most wonderful of all, when this stupendous work is finished, it is carefully sealed up; and so it has remained for thousands of years, until the rude hands of curious explorers forced a way into its inner sanctuary.

We are undecided as to which course to adopt, whether to visit the top or the interior of Cheops first. It is finally decided for the latter; so, accompanied by the whole rabble, with our picked men, and provided with candles, we mount the heap of rubbish that leads up to the little four-foot-square flue which is the sole entrance to the great mystery. Here let us offer a few words of advice, gathered from personal experience, as to exploring the interior. Go in very lightly clad, as the heat is oppressive, and the atmosphere rather stifling. It is not every one who can

perform the feat with impunity. We have met with some who have fainted outright upon coming to ground again; some who have turned back, fearing such an event. It is astonishing indeed how any pure air can possibly make its way into the passages and chambers, for the narrow ventilating shafts which run from the King's Chamber to the outer air have long since been choked by the accumulated dust of centuries. There is just sufficient air, but no more, to support life. The Arabs will carry anything the explorer needs to remove, so all superfluous clothing may be intrusted to the guide.

It is unwise to accept the services of more than one Arab for each visitor, as, if he finds himself in the majority, 'the son of the desert' is only too ready to assert himself by compelling his employer to pay more than is lawfully due to him. A friend of ours went in alone with two guides, and when they had led him far into the interior, they blew out the candles, and refused to relight them unless gold were given them. It was an awkward position. The darkness was indeed Egyptian for intensity; and the presence of two lithe, barefooted, unprepossessing Arabs, whose movements were excessively uncertain, was anything but pleasant. Fortunately, they are arrant cowards; and our friend getting a good hold of a swarthy neck in the dark, shook one of the rascals till he awakened the echoes of the King's Chamber with his cries for mercy; and the candles were at once relit. This is no uncommon trick. If the explorer exhibits any fear in entering the dark passages, through which at times he will have to pass on all-fours, the Arabs mark him soon enough as one from whom to extort money. The handle of a revolver protruding from a pocket is a most effective deterrent from annoyance; the traveller never needs to use it, but its presence is wholesome.

Our candles are lighted now, and we enter the flue, and have a weight of masonry above us which gives us oppressive nightmare sensations; and we are able to realise in part the awful situation of the man in Poe's tale upon whom the inexorable iron walls were slowly closing in. How puny one feels—how helpless! The floor is slippery as glass, the limestone casing having become like white polished marble, so we have to look to our footsteps. It is very dusty within too, a fine white powder soon covering our clothes. We are now at the bottom of the first passage, which stretches downwards to the level of the base of the pyramid; and here we come across signs of violent disruption, caused by the ignorant efforts of an early explorer to force his way into the building. From this point, a passage somewhat wider than the last rises dark before us; and we push on for one hundred and twenty-four feet, until we stand at the lower end of the Grand Gallery, which slopes upwards at the same incline. There is now plenty of space above our heads, for this so-called Gallery is twenty-eight feet in height. Its walls are formed of layers of masonry, each layer projecting beyond the one immediately below by three or four inches, so that towards the roof the walls close in considerably. Two banks of stonework run along the sides of this Gallery, pierced at intervals by curious square holes; for what purpose, it is difficult to conceive.

From the spot on which we now stand, here at the lower end of the Gallery, there runs a passage right into the centre of the building, parallel with its base, until it opens into what has been fancifully denominated the Queen's Chamber—a chamber twenty feet in height, with a pointed ceiling formed of immense slabs of stone, accurately fitted. Having seen this, we creep up the length of the Grand Gallery between the two banks of masonry, making use of the pigeon-holes to assist our slipping feet, until we at length stand within the furthest recess of the pyramid, the King's Chamber. Here, some say is the spot the mighty Cheops chose for his last resting-place, that he might differ in this respect from all preceding monarchs. Here lies the sarcophagus, now lidless and broken, which some say he hewed out of a block of Syene granite, for his own mummy. But the historians tell us how he never attained to the fulfilment of his wishes; for that his people, indignant at the enormous outlay in the building of this gigantic monument, remonstrated so effectually with his executors, that they were compelled to conceal his body, and afterwards bury it beneath the waters of the Nile.

This tomb-theory, as we may call it, has been rejected by some eminent Egyptologists, who see rather in these wonderful passages and chambers, a purpose and unity of design, which cannot be accounted for on the grounds of its being merely the efforts of a king to conceal perpetually the place of his sepulture. They assume to have discovered, after careful measurement conducted with patience and labour worthy of a better result, an extraordinary agreement of the proportions of the chambers, passages, and sarcophagus with the world-wide standards of lengths and capacities. They go very far, and say: 'Here we have the original revelation from heaven to man of our weights-and-measure system;' though why, if it be so, the being to whom it was revealed shut the knowledge up for ever, does not appear.

This theory is hardly satisfactory. No one can, however, for a moment question the unity of purpose exhibited throughout the building; but we should be content with a more reasonable deduction, somewhat like this: Cheops was a man far in advance of his age; he had sounded depths of mathematical and astronomical science far beyond the reach of his contemporaries; he stood alone in his own age, and feeling this superiority, with the haughtiness of a great intellect and despotic ruler, he said to himself: 'For what purpose is all my learning? These my people do not understand my researches. I will, therefore, in the building of my tomb erect a monument which will contain an everlasting record of my discoveries, and order my builders, when I am gone, to seal them up for ever. For I cannot think, in the slow progress of mankind, that any intellect comparable to mine will appear; so I will leave all my discoveries enshrouded in a mystery, and no key wherewith to solve it.' And indeed, if it was the intention of the monarch to mystify posterity, he has succeeded most thoroughly in his object.

We are back to the surface again, breathless, hot, and dusty; and now the ascent lies before us. Hauled up the whole four hundred and

fifty feet by two Arabs, and after many a rest by the way, we reach the summit, where one would suppose some peace and silence were to be found. But no such good fortune awaits the traveller. The novelty of ascending that gigantic outside staircase, with steps from four to five feet high, never seems to wear off from the Arab mind, and so the tribe follow us up, still persistent in their efforts to impose Brummagem goods upon us.

The air that blows across the desert is bracing in the extreme, and at this height—higher than St Paul's dome—we are free from the disagreeable odours of Egyptian villages. The waste of sand around is sad and depressing. We have a good bird's-eye view of the immediate surroundings of the pyramid. Besides the three great pyramids, there are several smaller specimens scattered about, crumbling to ruin and half-buried in desert sand; and also innumerable tombs, most of which have been opened by Lepsius and other Egyptologists. Close at hand, too, is the temple of the Sphinx, built by King Chephren, brother to Cheops, to whom Herodotus ascribes the construction of the second pyramid; and last, but most imposing, is the weather-beaten Sphinx itself, on guard over this vast Valley of Dry Bones, watching for the first streak of the dawn of that resurrection in which the old Egyptian believed so firmly.

The last piastres have been distributed among the begging Arabs; and with a crack of our driver's whip we start, the evening shades closing in upon us, and soon shutting out from our view those high-piled, hoary monuments of the past.

EPPING FOREST.

WITHIN a few miles of the great throbbing heart of London, there still remains a portion of the royal Forest of Waltham, which in ancient times covered a great tract of country, and extended to the very walls of the city. Its vast area included the Forests of Hainault and Epping, of which some six thousand acres of picturesque woodland have, after much opposition and many difficulties, been secured for public health and recreation. By the new charter of Forest rights, not only wide stretches of land, after years of cultivation, have been redeemed from inclosure, and restored to the Forest limits, but nearly thirteen miles of almost unbroken woodland scenery, forming perhaps the most extensive pleasure-ground in Europe, have been formally dedicated by the Queen to the use and enjoyment of her people for all time.

So far back as the twelfth century, in the reign of King Stephen, and again by a charter of King John, much of the outlying land was disafforested. Edward I.'s 'Charta de Foresta' still further reduced its bounds, which were again determined by Charles I.; and since that time, they have been diminished year by year by illegal encroachments. Not only the residents of East London, but the nation at large must feel grateful to the Corporation of the City for preserving and restoring as far as possible to its ancient limits, a landmark, grand in itself, and interesting by right of its connection with splendid and historic memories.

Strange indeed was the aspect presented by the ancient Forest at the inaugural ceremony on that bright day in May, when the cheers and shouts and merriment of half a million of people broke the classic stillness of the woods; where gaudy uniforms of guards of honour, military bands, and civic dignitaries, made a charming contrast with the golden gorse and broom, and the green background of the wooded slopes. In contrast, too, with the overcrowded population which presses so closely on the borders of the Forest, we are reminded of those days in 'Green England' when, even in the last century, the red and fallow deer haunted her endless glades and vistas, and drank at the rush-grown pools; when the venerable oaks and beeches harboured birds, which the denudation of heathlands have made so rare—the kite, the great bustard, and the bittern; when picturesque gipsy encampments lent another charm to the silvan scene. The ambitious life of civilisation has banished also from this cool green Forest barrier the primitive hamlets and homesteads that nestled under the grand old trees; the rustic cottages, built of wood, or mud and clay, hardened by the smoke that escaped from an aperture in the roof, and which Hollinshed tells us was considered a 'medicine to keep the goodman and his family from the quack.' But in these 'so homely cottages,' which could not boast the luxury of a glazed window, the Spaniards in Queen Mary's reign saw with amazement 'what large diet was used,' and reported that 'the English have their houses of sticks and dirt, but they fare commonly so well as the king.'

For many centuries, Waltham was a hunting-ground for our kings. Its woods have echoed with the mellow horn and the baying of hounds, as over the soft thick turf many a gallant cavalcade has swept in the splendid pageantry of royal hunts. With the old hunting-tower still standing in the Forest, is associated the name of England's greatest queen, who, inheriting some part of her father's rough masculine spirit, displayed a passion for the chase. The legend runs that Elizabeth on one occasion rode her horse up the broad staircase into the dining-hall of the old lodge at Chingford, whose walls have listened to the romantic gallantry that distinguished the court of the Maiden Queen; they have witnessed, too, the lovesuit of the magnificent Leicester, whose noble form was seen to the greatest advantage in hunting-suit of gold-embroidered Lincoln green, crossed by the jewelled baldric, from which were suspended the bugle-horn and forest knife; and who, in the reflected light of Elizabeth's favour, was a sovereign all but in name.

Indeed, every portion of the ancient Forest is suggestive of unexhausted interest to those who know something of its history. Around its annals group the figures of many royal personages, from Elizabeth in her stately ride to meet her troops at Tilbury Fort, at the period of the Spanish Armada; to Anne, who came to visit the famous oak; Edward III. and Johanna of Navarre, who alike retired amidst its solitudes; Richard II. starting from Havering-atte-Bower on his treacherous ride to Pleshy, the dower-house of many queens—away back to that name dear to the hearts of Englishmen, Harold, last of the Saxon kings.

We read how he loved Waltham—'the town in the weald or wood'—the estate given him by his brother-in-law the Confessor; how as a conqueror after Stamford Bridge, he came to pay his final vows prostrate before the 'miraculous crucifix'; how its name became his battle-cry of 'Holy Cross!' at Hastings; and how he was laid beneath its shadow in the Abbey Church—the simple inscription, 'Hic jacet HAROLDUS infelix,' marking his resting-place.

This far-famed Abbey for Augustin canons was reared by Harold on the site of an old hunting-seat at Waltham, built by Tofig the Proud, a great Danish Theyn, in the time of Canute. It was endowed by Richard I. with the manor of Waltham and 'the Great Wood,' and its mitred abbot possessed unusual rights over the adjoining country and Forest; for in days of old, particularly under the Anglo-Saxon kings, the recesses of the Forest were kept as sacred as the groves of the Druids, by laws harsh and terrible. One of Edward's laws declares: 'I will that all men do abstain from hunting in my woods, and that my will shall be obeyed under penalty of life.' Tradition says that the Confessor's favourite residence was Havering, 'because solitary, shrouded in woods, and fitted for devotion;' also because here he could follow his only pastime of hunting the wild-deer in the forest, which at that time abounded with 'wild beasts, the bull and the boar.'

From a gentle eminence, half-veiled in trees, can be seen a vast expanse of virgin forest, and the borders of six counties. Here are Buckhurst Hill and Golding's Hill, where the adjacent keeper's lodge still looks over the resort of the deer; there Staples Hill, the scene of the midnight assertion of the ancient claim of lopping and topping; farther still, beyond the intervening panorama of heaths and woodland, the valley of the Lea. What far-away forgotten memories are recalled by the placid windings of the river which Drayton says 'still brags of the Danish blood!' Over its peaceful waters has streamed the Raven banner of the Dane, when the dreaded war-ships of the Vikings came to ravage and destroy. Nine centuries have rolled away since Hasten the Dane towed his vessels up the Lea, and 'wrought a work twenty miles above London.' Here he was attacked, and here he defeated the Saxon thanes.

In earlier times still, in these same flowery meadows of the Lea, lay Alfred, encamped by the sombre woods, waiting whilst the Sea-kings passed defiantly up the stream; but as they disappeared, the Saxons obstructed and divided the waters of the river, and the gilded 'sea-snakes' never returned. What a picture must the Lea have presented, alive with those gallant craft, which were models of ship-building, and filled with the fierce war-sons of the North—those supreme heroes of battle on the seas. And the Vikings, with their kindred tribes, remaining to settle peaceably in permanent homes in the land they had come to devastate, formed part of the Anglo-Saxon population, and as worshippers of Odin, had their incantations for the dead in the heart of Waltham Wood.

Still more remote associations linger around the Forest. Within the ancient boundaries are still to be seen vestiges which recall events that

changed the face of Britain. At Ambresbury Bank are the complete remains of a vast Roman camp made by Suetonius, which cover nearly twelve acres of ground; whilst two miles away in the district of Loughton, lies the recently discovered British camp. In a pitched battle on the classic ground between these two encampments, in 61 A.D., Boadicea, queen of the Iceni, after attacking the Roman settlements and burning London, was defeated by Suetonius. The British heroine, Tacitus informs us, destroyed herself by poison; and all this part of South Britain passed into the Roman division of Flavia Casariensis.

In this restless nineteenth century, when the din of trade and shriek of railway-whistle echo on the outskirts of the woods, we may well be thankful for the preservation of this beautiful and extensive tract of forest scenery, lying so near the Great Metropolis, within the shadows and silence of which many a weary denizen of the East End of London may forget, perhaps but for a brief holiday, the mean and meagre surroundings of his daily life.

MY LOVE.

Six steps along the polished mead,
My true, my only love;
The white clouds fly in merry speed,
The great sun smiles above.

The yellow-cups of golden gleam,
The daisies silver white,
Uplift their dewy leaves and beam
A glittering delight.

The lark leaps up before her feet
With music on his wing;
The blackbird and the linnet sweet
Glad songs around her sing.

The crooked thorns in greeting shake
Their interwoven arms;
The tufted ash droops low to take
Full measure of her charms.

The grasshopper blows one keen note
From out his secret nest;
And butterflies, like snow-flakes, float
About her lily breast.

Tall meadow-sweet its perfume breathes
From every branching stem;
Bird's-eye with its long tendrils wreathes
A blue-starred diadem.

Well may ye lift your bold sweet song,
O birds that fill the air!
O flowers, well may ye shine and throng
To see a maid so fair!

PRICE 1½d.

UP A DUTCH CANAL.

'HOLLAND is severely characteristic.' This is what I think, as our steamer gently glides into one of the longest of her numerous canals on our way to Rotterdam. In almost every continental town, you are occasionally reminded of something you have seen before. In St Petersburg you are met at every turn by old friends amid new surroundings; there is a bit of Paris, Germany, or Italy, in the build of that mansion, palace, or church; and in the lively gesticulations and affable bearing of the polished Russian, you recognise a not unfaithful representation of our neighbour on the other side of the Channel. In Copenhagen you can scarcely realise that you are in Denmark, and not in some quaint old German town; there are the narrow streets, the high red-tiled houses with pointed gables, and the solemn, undemonstrative men and women with German phlegm in face and gait. In Berlin, though you feel that this is indeed Germany, you are not struck with any pronounced feature which marks it a German town and none other; 'Unter den Linden' you meet many Jews, who gabble an execrable jargon as they pass you; and there is no national costume to strike the eye.

But in Holland, everything is essentially Dutch. The very air which plays upon my cheek this bright spring morning, blows nowhere but in Holland; it is laden with a strange, warm moisture, and the all-pervading perfume of grass. And what grass! It is of the deepest, softest emerald, a green which affords delightful rest to the eye. For some time there is little else to look upon save field upon field of billowy grass, in which graze numbers of sleek dappled cows, looking so unnaturally bright against the vivid green, that I am forcibly reminded of an ancient toy-box which used to exist in the nursery at home, in which the cows were all dappled and of startling hues. The fields are divided by high dikes, along which the dry level roads are made; and ever and anon, a high two-wheeled gig, drawn

by a lean long-legged horse, spins past against the bright blue background of the sky. The landscape is dotted with innumerable and ever-moving windmills—from one point of view I count twenty-three—by means of which the water is drained from the meadow-land, and transmitted into the deep ditches which flow continuously into the canal.

As we turn a bend in the canal, a little low-roofed Dutch farm comes into view, and I am again reminded of the contents of that miraculous toy-box. There is the little square white house with its brick-red roof; the stiff squat trees, cut into shapes, the very trunks modelled after the same pattern; the flock of dazzling white geese with the same blamelessly clean red legs; the horse, leaning its wooden neck over a lavishly painted gate; and the same squat little woman with short petticoats, and square-shouldered man with the supernaturally black high-crowned hat. 'So,' I think with a smile, 'this is where the benevolent artist borrowed that grand idea which has awakened rapture in the hearts of generations of children.' But I am so engrossed with my discovery, that I had almost let the tiny church slip past me on the other side, though a bell is tinkling in the belfry, it being Sunday. There is no nonsense about it; a plain, whitewashed edifice, with steeple and weather-cock, standing boldly on its reclaimed plateau. No useless ornamental buttress; no trees or flowers in the little graveyard which surrounds it. A church and nothing else; spotlessly clean, painfully plain, and eminently Dutch.

The Lutheran pastor who wends his way along the up-raised road, might be mistaken for an English High-church clergyman, in his long black coat, broad-brimmed felt hat, and plain white bands. The women look extremely neat; they wear pretty white caps, with long curtains flowing over their shoulders; the married women, with curiously twisted gold ornaments standing out from each side of their heads, and frequently a gold plate, which fits on to the head, and shines through the clear muslin. Occasionally they have the addition of a pair of massive earrings,

which glance gaily in the sunlight. But I look in vain amongst them for a pretty face or graceful form; extreme cleanliness and a certain stolid air of good-nature being their sole charms. Their figures are ungainly; their gait rolling and awkward—the result of wooden shoes. That worthy farmer with his imperturbable square face, with its high cheek-bones and large features, looks as if he would be more comfortable in his work-day clothes and wooden shoes, than in that shining black go-to-meeting suit, with boots to match. He leads a solemn little urchin by the hand, a small miniature of himself, who looks wistfully at a group of boys and girls who sit in happy freedom on the grassy embankment which slopes down to the side-walk at the edge of the canal. The moment they see our boat, they start to their feet, and follow us in their clattering wooden shoes, as they keep up a continuous droning song.

'They are singing for biscuits,' the captain informs me; and soon a lively scene commences. The sailors flock to the decks, where much laughing and merriment prevail. The little sturdy Dutch legs do wonders, for we are proceeding at a fair rate, and their vigorous efforts are rewarded by an occasional ship-biscuit, which causes a general scramble, until they begin to drop off one by one, to sink down into the long grass to wipe their hot faces and munch their biscuits.

Now we are passing the tiniest toy-house, one blaze of white and red, standing in the centre of a few yards of trim garden. A small laburnum tree, weighed down with golden blossom, overhangs the porch, and heightens the vividness of colouring. A few apple-trees in full bloom, pruned within an inch of their lives—their trunks actually whitewashed!—constitute the orchard, whilst every available inch of the tiny beds in front is filled with flowers. The daintily curtained windows, too, are gay with bright geraniums. The whole is raised, from the danger of often-recurring floods, on a high and solid foundation of bricks and mortar, scaled by a flight of steps. As we glide past, the door is suddenly burst open, and a remarkable female apparition rushes down the steps with a whoop like that of a red Indian, which declines into a nasal version of the 'biscuit-song.' I presume she is a specimen of Dutch womanliness; but as I have never seen her like either before or since, I beg my readers not to suppose that she is a type. She is as long and lank as a Maypole, though her age cannot be more than fifteen. She has shoulders which slope away to nothing; a deficiency which, however, is more than made up by a prodigious width of body. Her costume is a full-skirted black frock; a white cotton cap, devoid of frills, which fits as if grown to her head; a pair of long black stockings, and wooden shoes. Her unexpected appearance is greeted by a spontaneous roar of laughter from

the crew, and she is instantaneously hailed as 'Sally.'

On we go, and 'Sally' follows; the shrill tones of the biscuit-song rise and fall in monotonous repetition, as if proceeding from some exhaustless wind instrument, and the wooden shoes keep time. Presently she is joined by a small boy, and a race begins. The short legs keep pace with the long ones in a way that is marvellous. A biscuit is thrown. They both fall upon it, and for some moments of suspense four wooden shoes wave wildly in the air. The small boy comes to light again looking flattened and tumbled; his countenance is immovable; but his rival is disclosing a large cotton pocket, which had hitherto been concealed beneath the ample folds of her skirt, and in it she deposits the biscuit. This tableau is repeated at intervals amidst the cheers of the sailors, for a period of time which does honour to Dutch perseverance, and the indefatigable 'Sally' is the last to give in.

As the sun begins to slope westward, I marvel at the manifold notes of the birds. I recognise the familiar tones of many an English field-songster. Larks fill the air with their rapturous melody; rows of swallows twit ceaselessly as they balance themselves on the telegraph wires which run alongside the canal; and corn-crakes answer each other from neighbouring fields. Occasionally, a pair of red-legged storks strut solemnly about the low marsh-land, or stop to bolt a struggling frog.

The sunset this evening, if portrayed on canvas, would be pronounced exaggerated; nor can my pen succeed in describing the marvellous scene. Above the horizon hangs a filmy cloud of mist, which gradually assumes the most exquisite tints of purple, pink, and gold. There is a clear watery light resting on the peaceful landscape, which deepens as the sun drops silently behind the distant meadows, until every object seems to stand out as if illuminated by Bengal-fire. Gradually the light dies down into a lurid red, and the white mist curls up from the humid earth. In a short time my jacket is drenched, and I am glad to descend to the cabin. My berth, to which I shortly retire, proves a miserable deception as a place of repose; for though the feathered minnesingers have long since sunk to silence, another music has commenced, which renders night hideous. Millions of frogs keep up their incessant 'Croak! Croak!' The noise is deafening, and diminishes not until the dawn is trembling in the sky. I hurry on my clothes before sunrise, and go on deck; and here I learn to thank my enemies the frogs for having driven me from my uncomfortable couch to the enjoyment of a picture which will never fade from my memory. We are lying at the gates of a sluice, and in a perfect grove of fragrant fruit-trees, through the blossoming boughs of which peep the bright red roofs of a picturesque village. As the sun mounts higher on the horizon, the heavy

dewdrops which hang from every leaf and blade of grass flash back showers of glittering rays, which quiver and vary their glorious hues ere they fall like pattering raindrops on the ground. On the quay stands a meek-faced black goat with her family of three, all as dusky as herself.

But the dew which is turning all nature into a fairy scene, is wetting me to the skin, and I am obliged to go below, and take possession of a thick woollen rug in which to envelop myself. As the morning advances, signs of life begin to appear. The door of a cottage is opened, and a woman, in the usual short petticoats and wooden shoes, issues forth with a bucket, and a long pole furnished at the end with a hook. She hangs her bucket on the hook, and dips it into the canal. Then a splashing and mopping begins; bucket after bucket of water is lifted and dashed against the front of the house. Other doors are opened, and the same conduct—to me inexplicable—is pursued, until the whole place is in a swim. When at length the cleansing process has been accomplished to Dutch satisfaction, a plank having been placed from our boat to the quay, the women begin to flock on board with their baskets of eggs and butter, which the steward tells me are very dear. ‘The Dutch,’ he says, ‘know how to drive a bargain.’

Many of them speak a few sentences of English; and I am impelled to buy some suspiciously green-looking oranges, at an exorbitant price, from an enterprising saleswoman because she accosts me with: ‘Will you buy, my leddy? Scheap! scheap!’

It is nearly mid-day before we get through those sluice-gates and drop down towards Rotterdam. We pass other canals, which stretch away from us into the country. There are many of them so narrow that only small craft can ply upon them. The windmills multiply and then suddenly cease, for we are now in a region where they are unavailing; the land lies much below the level of the sea, and is irreclaimable. Most desolate, even in the bright mid-day sun, is the appearance of the shores. We are no longer in a canal, but in a wide sweep of dark turbid water, fringed by a wilderness of sedges and osiers. Flocks of teal and brent rise with harsh discordant cry; whilst water-hens bob in and out amongst the twisted roots of the willows. In the background rises the bare straight high-road against the horizon. Here and there a tiny cottage stands on its platform of brick; at the foot of a flight of steps, a boat lies moored; the only means of exit and egress being by water. The occupation of these lonely dwellers of the marsh is osier-cutting. The osiers are split and made into hoops, an extensive traffic being carried on between Holland and other countries in this commodity.

Soon we begin to pass numerous vessels; the water widens, and a forest of masts rises in the distance, and there is Rotterdam. Very quaint and picturesque looks the ancient city with its curious gabled houses, over whose roofs the spires of more than one old church appear. The broad quay is planted with magnificent lime-trees, which also rear their leafy branches over the side-walks of the many canals which intersect the town like a network, where busy craft pass

up and down. But when the noise and bustle of the day are stilled, and I sit on deck and watch the great round moon lift her yellow face above the tall ships’ masts, and softly throw her magic mantle over the scene, I think that Holland, with its ever-present waters, is a land of beauty and wonder.

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

CHAPTER XXVII.—LIKE A GHOST REVISITING OLD HAUNTS.

WALKING slowly to his hotel through streets which had a half-awakened air about them, as if they, like himself, had been turning night into day, Mr Lumby was conscious of a singular sensation. It was as if an elastic cord alternately tightened and relaxed itself within his head. The tightening was terrible; the relaxation brought with it a very remarkable feeling of looseness in the brain, as though it had lost its boundaries. These curious symptoms recurred slowly at first; but after a little time the cord began to tighten and relax itself at an astonishing pace, and this, before he had gone far, resulted in a splitting headache and a general sense of stupefaction. ‘I have been over-excited,’ said the merchant to himself as he passed his hand across his forehead, and stood for a moment bareheaded in the chill morning air. ‘Now I come to think of it, I have been terribly excited. Yes; it has been an exciting time, quite an exciting time. We have had a near shave, Gerard, a near shave.’ Rousing himself to a knowledge of the fact that he was standing uncovered in the street, and seeing that a shop-boy had paused in the act of taking down shutters to stare at him, he resumed his hat and walked on. He seemed to take the matter very calmly now, he thought. A minute later last night, and Garling might have been triumphant after all. ‘Yes,’ he repeated vaguely, ‘it was a near shave.’ The tightening and relaxing cord in his head seemed in some inexplicable way to have got hold of that phrase—‘a near shave’ with a tug of dreadful pain—‘a near shave’ with a sense of dreadful laxness and a loss of the brain’s boundaries, as though it were altogether unfenced, and flowed out loose until the tug came and drew it together again with—‘a near shave’ for watchword. He was dimly conscious that this physical condition involved a mental condition which was as unusual as itself. The pain in his head was becoming unbearable by the time he reached the hotel. Boots, again amazed by his appearance at this abnormal hour, asked if he could do anything for him.

‘A near shave,’ said the merchant vaguely.

‘Shave, sir?’ said the Boots. ‘Send for barber, sir, d’rec’ly, sir.’

‘No; never mind that,’ said Mr Lumby, awakening as if from a dream of fog with a horrible headache and one persistent phrase in it. ‘Bring me a cup of tea—strong tea—unusually strong tea.’

‘Yes, sir,’ said the Boots; ‘d’rec’ly, sir.’ That was Boots’s formula.—‘Looks awful ill,’ he thought, looking after the merchant. ‘Odd thing for an elderly cove like him to be out all night two nights running. Ain’t it now? And he

never was a frisky cove neither—not when he was young.' Boots was getting elderly, and remembered Mr Lumby this many a year, and had an interest in him. He hurried off now for the tea, and was curious or interested enough—not having much upon his hands just then—to see it made and to volunteer to take it up himself. He was a sort of idealised Boots, and had two other actual Boots beneath him. His function at his present time of life consisted chiefly in telling the way to everywhere, the cab fare to everywhere, and the time of starting of all trains at all stations—an occupation purely intellectual, and making large demands on the mental resources. Mr Lumby in the eyes of Boots was as important a person as a prime-minister, if indeed a prime-minister could have come into measurable distance with him. The head of a great City house, member of parliament for his county, who might have been Lord Mayor as often as Dick Whittington if he had chosen, was necessarily a figure in that old-fashioned City hostel, where his father and grandfather were remembered as guests before him. Boots found the great man sitting on the bed, and noticed that he looked not only ill, but bewildered.

'Excuse me, sir,' said the Boots; 'you ain't like yourself at all, sir. Shall I pull your boots off, sir?' He was down upon his knees at this task at once.—'Can't ha' been a-drinking?' he thought, looking up at the venerable face above him. 'Been a-watching by a sick-bed,' he concluded charitably; 'that's more likely. That's where he's brought that troubled look from.'

'Give me the tea, if you please,' said the merchant, with a sudden awakening look. 'I have a very bad headache.—Boots!'

'Yes, sir.'

'I have business,' said the great man, rising teacup in hand, and speaking and looking a little vacantly, 'important business at—I have business'—he was bright and clear again.—'at ten o'clock. I have time for an hour's sleep. Call me in an hour, and bring me another cup of strong tea. And I will take a hot bath.' He drank the tea, and passed his hand across his eyes; then knitting his fingers, pressed both palms heavily against his forehead, and in that attitude walked twice or thrice across the room and back again. 'In an hour's time, Boots,' he added, as that functionary was about to close the door—'not later.'

Being left alone, he partly undressed, and wrapping himself in a warm dressing-gown, stretched himself on the bed, and almost instantly fell asleep. So profound was his brief slumber, that when at the end of an hour Boots returned, and, beginning to make preparations for the bath, awoke him, Lumby found it difficult to believe that he had been left to himself more than a minute. It cost him a severe effort to rise; and no sooner was he erect again, than the cord within his head began once more to tighten and relax itself, and the aching sense of stupefaction returned. But a bath, a complete change of clothing, and another cup of strong tea, made no bad substitutes for a night's sleep, and he went out refreshed to meet Garling. Looking back at the condition into which he had fallen on first entering the street, nearly two hours before, he felt some

alarm—of a retrospective sort—at the symptoms. 'It was no wonder,' he said as he walked briskly on, trying to forget his headache or to walk beyond it. 'The strain had been very terrible.' He was yet too near the edge of the precipice to dare to think much of the terrors he had escaped from. 'A little more of that,' he told himself, 'and I might have gone mad. I must be very cool and wary of excitement now.'

He reached the offices, and walked in square and upright. If he had been closely noticed, it would have been seen that his eyes were filmy, and that the flushed colour of his skin was of a different hue from that healthy redness of complexion which his face commonly wore, proof of a pure life and a good digestion. It wanted a few minutes of the hour, and there were but one or two of the clerks yet arrived. These, as the chief went squarely along, nodding here and there, noticed nothing unusual in him. Nor did any one observe any especial change in Garling when, two or three minutes later, and punctual to his hour as ever, he paced slowly in, with his hands behind him and his furtive eyes bent downwards.

Garling had not meant to be here again. He was not an imaginative man by conscious practice, but no man ever had great mental powers without the imaginative faculty being in strong force amongst them, and Garling felt like a ghost revisiting old haunts. He did not greatly care about being defeated, and he thought that curious. It was in remarkable contradiction to his sense of almost absolute indifference that when, in the course of dressing after his employer's departure, he had made preparations for shaving, he was compelled to huddle away his razors and lock them up, in a sudden terror-stricken distrust of his own will. It would be too powerful a temptation—not to *him*, for his indifference astonished him—to his hand. That, he noticed as a phenomenon hitherto unobserved, or, until now, outside his experience, and thought it would be psychologically interesting to know if suicides were ever committed in that mood and manner. Once or twice, as a matter of mere theory, and not as having much relation to himself, he wondered whether Lumby had left him any loophole of escape. He had left him two hours alone. What might have been done in two hours? To re-secure his fraudulent gains, nothing. To escape?—he had nothing to escape from. His personal liberty was guaranteed already, under certain conditions. One of them was that he should present himself at the offices at ten o'clock. He went thither automatically, with the sense of a ghostly revisiting of old scenes and resumption of old habits accompanying him and growing upon him all the way. He had been sleepless for two nights, and had a feeling of dreaming awake, and of walking in an atmosphere of nightmare, which might take shape at any moment in such forms as only the dreadful hollows of dark night can hold.

And so, almost exhausted on either side, the two combatants met again. On Garling's entrance, Mr Lumby arose and locked the door. He had waited in the room which the cashier had always used; and now resuming the seat from which Garling's coming had disturbed him, he waved

him to another on the opposite side of the table. It was the seat the regular occupant had been in the habit of offering to visitors. The cashier had an oddly-vivid feeling as he took it, of being now a stranger in the place. There was no bitterness or defeat in this: it tickled him a little, and he suppressed a smile. He was puzzled to define the humour of the situation, but it was there, none the less. Lumby, for his part, between the racking headache which had again attacked him, and the sleepy stupor which dwelt on all his faculties, had to make an effort to decide within himself for what purpose he had called Garling there. There was silence for a space of perhaps half a minute.

'One thing was omitted when we parted this morning,' said the merchant coldly, having regained the lost thread of his thoughts. 'I have your written confession here, and your statement of the funds which lie in your name at the Bank at Madrid. I want now your order for the transference of those funds to the Bank of England, to be placed there to the credit of the House.'

'The sum is a large one,' said Garling, 'and they will more easily meet the demand if it be made by instalments. Say fifty thousand now, and fifty thousand fortnightly afterwards, until the whole is withdrawn.'

'Say weekly,' said the merchant.

'Very well,' returned Garling.

'I shall require you to accompany me to the Bank, and to have inquiries wired to their agents in Madrid.'

'Very well,' said Garling again.

'Your being here this morning is a proof that you recognise the futility of any attempt to escape until your restoration is completed. Your only safety lies in obedience. My pledge will not operate a moment beyond your failure or rebellion.'

'I understand,' responded Garling.

'Prepare the necessary drafts,' said the merchant rising, 'and bring them to me. Before I leave you, surrender your keys. Be ready to accompany me to the Bank by mid-day.' Garling produced his keys, and suppressing an inclination to fling them on the table, laid them gravely down. Where was the use of a demonstration of rebellion when he was bound body and soul? Mr Lumby took them up, unlocked the drawer in which he had placed Garling's confession, withdrew that document, and placed it in the safe, the cashier watching him all the while with wicked furtiveness. Next the merchant laid a heavy hand upon the bell. 'Ask Mr Barnes to come to me,' he said to the messenger who answered to the summons. After a short pause, enter Mr Barnes, a placid but keen-looking man, with a frame of wiry white hair about a healthy-hued face, and calm gray eyes which looked through gold-rimmed spectacles. 'Mr Barnes,' said the merchant.—Mr Barnes bowed ever so slightly.—'You will take your place in this room, if you please, until you receive further instructions. Attend to these matters in the first instance'—waving a hand towards the heaped documents and letters on the table—'and take to-day the general direction of affairs. The matter need not at present be mentioned, but Mr Garling has ceased to hold any connection with the firm.'

Mr Barnes was like one thunderstruck by this

intelligence. If he had been told that Jupiter had ceased to have any connection with the planetary system, it could not have hit him harder. And in that supposititious case there would have been the refuge of unbelief to fall back upon, whilst here he was bound not to question for a moment. It was not a specified part of the merchant's undertaking with the cashier that his crime should be kept a secret, but there were many reasons which made that seem advisable. Lumby's own self-esteem went strongly in that direction, and the firm had not been accustomed to the employment of fraudulent servants. His pride in the probity of the House seemed smirched by this associate villainy, and he was not wishful to spread such a sentiment in other minds. The temporarily appointed cashier being left to his own amazement, came out of it gradually, with a general verdict of—something wrong somewhere.

'Is it your desire that I should send for the necessary forms, or myself apply for them?' asked Garling, addressing Mr Lumby, in his ordinary business tone.

'As you please,' he answered. 'But be ready to accompany me at noon.—You will open the letters and attend to general business matters, Mr Barnes.' The merchant withdrew into his own room and closed the sliding panel. 'Safe,' he thought, 'quite safe now;' and reaching with something of a blinded groping motion for a chair, he sat down and turned himself to the table. How horribly his head ached. It was well he had been able to keep a clear mind so far, and carry the situation through to this point. Thinking of what the consequences might have been, but for his seemingly accidental resolve to impeach Garling without waiting for further discoveries, he half started from his chair twice or thrice. That awful cord was tightening and loosening in his head again, and he could scarcely see for pain. An hour or two more and he would be free to rest. The excitement had been too much for him, and he would go back to the hotel and sleep it off. Sleep was all he wanted. The strain had been more than he knew of at the time, and he was not so young as he had been. Thinking thus, he sat with his arms lying heavily on the table, and with his head depending downwards heavily. More and more leaden grew the weight of pain, and at length his head drooped on his arms, and he fell asleep once more.

AN OLD ENGLISH BATTLEFIELD.

THE stupendous character of modern military conflicts, and the altogether different conditions under which the campaigns of these later times have been conducted, are apt to obscure the struggles which a few centuries ago helped to shape the history and destiny of our native land.

Among the classic grounds of English history, Bosworth Field claims a foremost place. There the curtain fell on a long and tragic drama, one that for some thirty years had occupied, with bitter results, the whole stage of English history. The last conflict between the rival 'Roses,' it was also the most romantic, and therefore, perhaps, the most interesting; yet, from the circumstance that

it had no contemporary historian, and that, therefore, but few authentic details are preserved of the fight, its importance is apt to be overlooked. Shakspeare's dramatic version is of course somewhat fanciful and unreliable, though it has notwithstanding "an immortal place in his writings. A brief and quaint account appears in Burton's *History of Leicestershire*, published in 1622; and at a later period, William Hutton, the indefatigable Birmingham antiquary, spent a long time in the neighbourhood of the battlefield, and from his researches among the records and traditions of the district, compiled an elaborate account of the conflict. His history is, however, more or less inaccessible and unknown to the general public; hence it seems desirable that the most reliable descriptions of the conflict should be reproduced for the general advantage of modern readers.

Shenton Station, on the Ashby and Nuneaton line, is the most convenient halting-place for Bosworth. Crossing the railway by the foot-bridge south of the station, the elevated ground is reached, known as Ambian Hill, which not only commands an excellent view of the whole area of the battlefield, but was, in fact, the centre of its fiercest struggle. About a mile to the south-west can be seen some meadows, called the White Moors; and here the Earl of Richmond was encamped on the eve of the battle. Landing at Milford Haven on Saturday, August 6, 1485, with about two thousand followers, he had advanced through Cardigan and Welshpool to Shrewsbury, his army increasing considerably *en route*. He encamped outside Lichfield on Tuesday, August 16; and next day advanced through Tamworth to Atherstone. Two days earlier, Lord Stanley and Sir William Stanley had preceded him with their Cheshire troops, ostensibly to aid the king's cause, yet secretly sympathising with Richmond. It is said they held a private interview with the latter at Atherstone; and on the eve of the great conflict, managed to dispose of their forces so as to be able to declare for Richmond when the crisis came. The latter led his troops from Atherstone over the bridge at Wetherley, encamped on the White Moors, and constructed intrenchments, traces of which remained up to very recent years.

The king, hearing of Richmond's landing at Milford, made due preparations to meet him, and advanced to Leicester with about twelve thousand men. Leaving that town on the morning of August 17, and expecting to meet Richmond at Hinckley, he made for Elmsthorp, reaching that place in the evening, and, with his officers, spending the night in the village church. Finding he was too early for his rival, he moved a little to the north-west, and encamped on some high ground called the Bradshaws, close to Sutton, and about a mile due west from our stand-point. About two miles to the south, the tall spire of Stoke-Golding Church is seen; and on the left, a little nearer, the quaint church and village of Dadlington. Half a mile beyond the latter, and about a mile east of Stoke, was Lord Stanley's camp, bounded by a small stream called the Tweed. His lordship had posted his men ostensibly to protect the king's left flank, but in reality to attack it if circumstances should

be favourable. The Duke of Norfolk with four thousand troops encamped on the slopes of the hill north of Sutton; and Sir W. Stanley supported his right with about three thousand more. Such were the positions of the contending forces on the eve of the fight.

Hearing of Richmond's movements, the king had moved his forces on the 21st to some ground called Dicken's Nook, behind Sutton Hall to the west, addressed his troops as to the expected conflict on the morrow, and there pitched his tents. At four o'clock on the morning of the 22d, Richard was astir, and advanced his men in the direction of his antagonist. The archers formed the front line, commanded by the Duke of Norfolk; and following these, came the king with a compact body of men, flanked on each side by cavalry under the Earl of Northumberland and Sir Robert Brakenbury. These troops covered the northern and eastern sides of Ambian Hill, and there awaited the expected attack.

At ten o'clock, Richmond with his seven thousand men crossed the Tweed and the morasses that bordered it, and advanced towards the southern side of the hill. A body of Norman archers led the way, commanded by the Earl of Oxford. Sir Gilbert Talbot held the right wing, and Sir John Savage the left; while Richmond, clad in armour, commanded the centre. And then the fight commenced. 'Lord!' says Graftbury, 'how hastily the soldiers buckled their helms! how quickly the archers bent their bows and flushed their feathers! how readily the billmen shook their bills, and proved their staves, ready to approach and join when the terrible trumpet should sound the bloody blast to victory or death!' Then we are told: 'The trumpet blew, and the soldiers shouted, and the king's archers courageously let fly their arrows. The Earl's bowmen stood not still, but paid them home again, and the terrible shot once passed, the armies joined and came to hand-strokes.'

For an hour the battle raged furiously round this hill, between the men under the Duke of Norfolk and the Earl of Oxford, the two leaders even engaging in hand-to-hand combat. But a stray arrow killed the Duke, whose son, the Earl of Surrey, with others, made a desperate effort to avenge his death, but in vain. Then Richard ordered Northumberland to advance; but his troops wavered; and at that moment, Lord Stanley came up with his men, and joined Richmond—an ominous movement, the gravity of which Richard was not slow to understand. The crisis was becoming desperate, and needed desperate measures; hence, hearing that Richmond with his body-guard was posted on the other side of the hill, the king determined on a supreme effort—nothing short of an encounter with his rival in person, shouting in a tone of despair: 'If no one will go with me, I will go alone.' Some had urged safety in flight; and according to one account, a fleet horse was brought, with which the king, then in great peril, might have secured his life; but instead of desiring to escape, as Shakspeare represents, he indignantly rejected the proposal. Putting spurs to his own charger, he made a rush at Richmond, followed by his body-guard, including Lord Ferrers, Lord Lovell, Sir Robert Brakenbury, and Sir Richard Ratcliffe. The

fight was short and desperate. With one exception, the king's companions were all cut down, several of Richmond's sharing the same fate; and then the two rivals were about to fight single-handed, when Stanley's men coming up at that critical moment, created a diversion, and the king was immediately surrounded, his horse was entangled in a bog, and as his enemies closed in, he was speedily slain.

With the king's death, the battle at once collapsed. Sir Robert Brakenbury's troops made a feeble stand, but soon wavered; the centre did likewise, and fell back. Outflanked, however, by Stanley's troops, they failed to reach their tents, and fled across Radmoor Plain towards Dadlington, fighting as they went, and there the pursuit seems to have ended.

On Crown Hill, an eminence which adjoins the present Stoke Station, the king's crown, discovered hidden in a thorn-bush close by, was placed on the head of Richmond by Lord Stanley amid shouts of 'Long live Henry VII.!' Richard's body was dragged from the heap of slain, tied across a horse, and conveyed to Leicester, where it was exposed to view in the town-hall, and then buried in the church of St Mary, in the Greyfriars.

Thus perished the last of the Plantagenets. His character had been darkened by cruel murder, and few of his subjects cared to risk their lives in the defence of one so unfit to retain the throne. The result of the fight at Bosworth was therefore, all things considered, generally welcome to the England of that period.

The site of the battle has of course undergone considerable transformation in later times. A canal and railway now intersect its area; the swampy ground has been drained, and a wood occupies what was once a morass, the nature of which had something to do with the dispositions, and perhaps also the result of the conflict. Within living memory, many relics of the fight have been discovered during draining operations. In the churchyard at Dadlington, large numbers of the slain were interred; and a few years since, in digging new graves, piles of skeletons were unearthed, lying five or six deep. The ill-fated king's remains were disturbed much earlier; for when the monasteries were secularised, his tomb was destroyed; and it is said that his body was thrown into the river Soar, and his stone coffin afterwards used as a horse-trough. In 1612, however, Wren states in his *Parentalia*, that he saw, in Alderman Robert Heyrick's garden at Leicester, a handsome stone pillar, three feet high, inscribed: 'Here lies the body of RICHARD III., sometime King of England;' and at the present day there is a tablet in King Richard's Road, Leicester, stating that 'Near this spot lie the remains of Richard III., the last of the Plantagenets.' But no grave or mausoleum now exists by which his last resting-place can be verified, and hence those royal remains, unhonoured in death, have long since been scattered—how and where, none now can tell.

At Bosworth Hall, the seat of Sir Beaumont Dixie, are preserved several alleged relics of the fight—such as the suit of armour worn by the king, cannon-balls dug up from the field, and various weapons; although some antiquaries are

of opinion that the last-named belong to a subsequent period.

Close to the well where the king is said to have drunk on the eventful morning, was erected in 1812 a cairn of stones about twelve feet high, with an inscription in Latin to the following effect: 'With water from this spring, Richard III., king of England, quenched his thirst whilst very valorously and with bitterest incensement fighting in battle against Henry, Earl of Richmond, about to lose life as well as sceptre before nightfall, August 22, A.D. 1485.' This well, situated at the northern edge of the wood now existing, is an interesting memorial of the memorable battle of Bosworth Field. In 1862, the British Archæological Association, then in session at Leicester, visited the spot; and on the site a paper was read, and a fac-simile of the king's crown and various delineations of that monarch and his insignia, exhibited; but although the proceedings of that day aroused a deep interest in the historical events of 1485, they resulted in no practical steps being taken to commemorate the battle.

Since 1862, however, a considerable revival has taken place in antiquarian researches. The impulse which higher education has imparted to such subjects, has awakened an interest in the renowned events of history, and visitors in ever-increasing numbers repair to the spots made classic in their country's annals. On many other English battlefields, memorials have been erected to point out to future generations the scenes of ancient struggles for freedom and power; and yet on Bosworth Field, nothing worthy of the name exists. Among our wealthy citizens, proud of their country and of its long and eventful history, there must be those who would regard it as some honour to take part in perpetuating by a suitable monument the spot where one of the 'decisive' battles in English history took place.

THE FISHERWOMAN OF HONFLEUR.

A TALE OF THE FRENCH COMMUNE.

IN FIVE CHAPTERS.—CHAP. III.

ON quitting the *bureau* of the *avocat*, the young fisherman inadvertently wandered into the twentieth *arrondissement*, formerly a detached village, called Belleville, but now one of the most turbulent districts of Paris, and at that period the headquarters of Communism. He soon discovered that he had strolled away from those parts of the city he wished to see; but as he wandered along, seeking to get clear of the dirty, narrow streets which opened in every direction, whichever way he turned he found himself becoming more and more involved amidst the intricacies of the poverty-stricken quarters; and still, unknown to himself, he was followed by Lucien Pierrot. It would have been difficult, probably, for Lucien to say with what special object he thus followed the young fisherman in his rambles through the city. It was perhaps chiefly that he sought to discover Antoine's motive for coming to Paris so soon after his return from sea; while at the same time he may

have thought that something might occur that would enable him to gratify his long-cherished craving for vengeance. If the latter notion occupied his thoughts, the opportunity occurred sooner than he could have anticipated.

Antoine was passing through one of the longest, crookedest, and narrowest streets of this disreputable district, when he saw, a few paces in advance of him, a young lad of eighteen, who was apparently a stranger in Paris, and who seemed to be wandering about without having any particular object in view. That the young fellow was a peasant, was manifest, not only in his garb, but likewise in his gait, manner, and whole appearance. He wore a blue linen blouse, belted round the waist, and a pair of clumsy sabots, which, together with his leathern gaiters, were incrustated with the dried yellow mud of the country lanes; and as he slouched along, as if he were traversing a newly ploughed field, he stared about him with a look of stupid wonder and curiosity. Suddenly, three of the small, boyish-looking soldiers of which the infantry of France seems to be mainly composed, bearing muskets and fixed bayonets that to a casual observer would appear too heavy for them to carry, pounced upon him from beneath a covered gateway, one of the party seizing him by the collar of his blouse and declaring him to be under arrest.

For a few moments the youth appeared to be stupefied; then he struggled to release himself, but was instantly seized by another of the soldiers, while the third, whose arm bore a corporal's stripe, told him that he had better come quietly to jail.

'Why do you arrest me? What crime have I committed?' whined the young man, as he trembled in every limb. 'I have but this day arrived in Paris. I am a stranger in the city, and am innocent of wrong-doing.'

'Innocent! Of course thou art innocent, *mon brave*,' sneered the corporal. 'Harmless as a lamb. Nobody is ever guilty, according to his own account.—Take the fellow along, comrades!'—addressing the soldiers—'the mob is already closing up behind us.'

This was true. Whence they came, it would have been hard to say; but in less than half a minute, the hitherto almost deserted street was thronging with truculent, ill-looking men, and dirty, frowsy, hard-featured females, clad in every variety of ragged costume, who appeared like so many hideous scarecrows; while still others came forth from every doorway in the narrow street. All took common cause against the soldiers, two of whom levelled their muskets, and prepared to defend themselves from the threatened attack, while the third took charge of the prisoner. Many of the men were armed with short, stout cudgels, and some of the women grasped broom-handles in their sinewy hands. The women were loud in their clamour.

'*Fi donc, fi!*' they cried. 'Let the lad go free, *mouchards, tyrans*—spies that ye are!'

Perceiving that the crowd took his part, the young fellow said: 'Believe me, *citoyens* and *citoyennes*, I am innocent. I have but this day

arrived in Paris. My father is an honest farmer of Clermont. 'Tis the first time I have been in the city. I have come to see my brother, who is an honest artisan, and works somewhere in this quarter of Paris.' There was apparent truth in the young man's looks and voice as he pleaded with the crowd.

'That is doubtless true,' cried a stout, burly virago, whirling a broomstick over her head, to the imminent peril of her companions. 'Poltrons!'—addressing the male portion of the crowd—'cowards that ye are! Have ye no spirit, that ye would let a poor lad be dragged to prison, to be shot on the ramparts to-morrow, when half-a-dozen women might set him free?'

Hearing his prophetic doom thus pronounced, the poor lad wept aloud, as he entreated the crowd to release him.

Irritated by the woman's taunts, the men caught up the cry, 'To the rescue! To the rescue!' and bore down savagely upon the soldiers, two of whom bravely kept the leaders of the mob at bay for a few moments by charging with their bayonets. But muskets and bayonets were soon wrested from them; they were struck down and brutally kicked and trampled upon, and their uniforms torn into shreds. The third soldier, however, disregarding the perilous position of his comrades, had retained his grasp of the prisoner, and, unnoticed by the mob, who were fully occupied in wreaking vengeance upon their natural foes, the military, had dragged the unfortunate youth into a by-street, and would speedily have disappeared with him, had not Antoine, who had hitherto looked on as if bewildered, but whose sympathies were with the peasant, hastened to the rescue of the young lad. Wrenching the musket and bayonet from the grasp of the soldier, he struck him senseless to the ground with one blow of his fist. 'Run, lad, run!' he cried. 'Dost not see that thou art free? Away, away!'

The peasant, who for a few moments seemed to have become paralysed with terror, made off as fast as his legs could carry him.

The beat of a drum and the steady tramp of feet were heard near by.

'Scatter! Scatter and fly!' shouted a hoarse voice in the rear of the crowd. 'Do ye not hear? The soldiers are approaching!'

The mob disappeared as rapidly as they had gathered, leaving the unfortunate soldiers stretched on the ground bleeding, bruised, and senseless. In half a minute the front rank of a troop of soldiers appeared at the entrance of the street. Antoine was stooping over the soldier whom he had struck down, striving to restore him to consciousness. He knew not of the approach of the troop until the men were close upon him, when, suddenly becoming aware of his own danger, he took to flight. Some of the soldiers started in pursuit of the fugitive, while the main body hastened to the succour of their hapless comrades. Antoine, however, gained upon his pursuers, and would have escaped, but that on turning the corner of a street, he found himself confronted by another party of soldiers who were hastening to the scene of the disturbance. He stopped short, and was about to take refuge in a narrow court, where he might have concealed himself till the soldiers had passed by, when Lucien Pirrot, who had

never lost sight of the young fisherman, and had witnessed all that had occurred, shouted: 'Seize that man! He is a Communist, and was the leader of the mob.'

In an instant, Antoine was surrounded, seized, and pitilessly dragged off to prison. There was a brief examination before a sergeant of police, in which Lucien Pierrot, who appeared as prosecutor, denounced the prisoner, Antoine Duroc, as a Communist leader of the lowest and vilest class, and swore that he had seen the prisoner strike a soldier down with his own hand and brutally maltreat him, thus effecting the release of a man under arrest.

Antoine, who declared that he was not a Communist, and that he knew not the meaning of the word, did not attempt to deny that he had struck down a soldier, and released a poor young peasant whom he believed to be innocent. This was enough; he was ordered to be confined and closely guarded until he could be brought before the military authorities the next day. The jailer, however, who was a native of Brittany, and had heard the young fisherman's simple story, believed in his innocence. He knew Lucien Pierrot as a paid government spy, and believed him capable of any falsehood or iniquity whereby he might gratify his malice against any individual who had offended him, or might pocket a reward for his vigilance in behalf of the government. He pitied the unfortunate prisoner; and Antoine, who felt the need of sympathy, spoke of his young wife, who would now be impatiently awaiting his return from Paris.

'It grieves me sorely, Monsieur,' he added, 'that I have no means of acquainting my poor Madeleine with the misfortune that has befallen me. She will not know what to think, and will fear that some serious accident has happened to me.'

'Thou canst write to thy wife, *mon ami*,' said the jailer. 'I will post the letter.'

'Monsieur, I cannot write,' replied Antoine.

'Then tell me what thou would'st say, and I will write for thee.'

Antoine dictated a few lines, informing Madeleine that he was in prison in Paris, having been denounced as a Communist by a government spy named Lucien Pierrot; but, anxious not to alarm his wife, he expressed the hope that he would speedily be released, and that he would be able, when taken before the court, to prove his innocence.

The jailer shook his head gravely, but made no remark; and probably Antoine himself did not feel the confidence in his speedy release that he sought to impart to his wife; though, being ignorant of the dreadful severity with which those who were suspected of Communism were punished, he doubted not that he would be set at liberty in the course of a few days at the furthest.

The letter was despatched; and was received by Madeleine at the moment when she was setting forth to meet her husband at the Honfleur railroad *dépôt*, fully expecting him to return that day.

The young wife was dreadfully alarmed on reading the letter. 'It is my fault,' she thought. 'I am to blame. I ought not to have concealed from my husband the base conduct of the villain

Lucien Pierrot. He threatened me with vengeance, and now he has accomplished his purpose. If I had told Antoine, he would have been on his guard against the wretch, and this trouble would not have occurred. But I acted, as I thought, for the best.' She sunk into a chair, and for a few minutes felt perfectly helpless; but recollecting that it was necessary to exert herself immediately in her husband's behalf, she determined to proceed instantly to the mayor of Honfleur and seek his advice and assistance.

Monsieur le Maire was himself the owner of numerous fishing-luggers. Antoine was known to him, and was a favourite with him; and Madeleine knew that he would do all in his power to help her in her sore trouble. He read the letter, and heard from Madeleine the story of Lucien Pierrot's base conduct towards her. That Antoine had no connection with Communism, he was well aware; but he read the journals constantly, and he knew that the government, having been terribly frightened, were now proceeding with ruthless severity against all persons even suspected of complicity with Communism. That the young fisherman was guiltless of any such complicity, he could prove, if it were not already too late; but then he knew nothing of Antoine's having assaulted a soldier and released a man under arrest. Nothing of this was mentioned in the letter.

'You must hasten immediately to Paris,' he said. 'I know not what else to advise. I am acquainted with the *sous-préfet* of police—a worthy man, who will do all in his power to help you, if satisfied that your husband is innocent. But you must lose no time. I will give you a letter to Monsieur le Sous-préfet.—Shall you need money?' Not wishing to alarm Madeleine, the mayor said nothing to her of his own fear that it might be already too late to save her husband. He wrote the letter, and handed it to her, and having been assured that she needed no help in money, advised her to set forth immediately.

The young wife needed no urging. Anticipating the result of her interview with the mayor, she had left her babe in charge of a kind neighbour; and proceeding instantly to the railway station, she, after five tedious hours, reached Paris. A stranger, unaccustomed to the noise, bustle, and confusion of a great city, she felt for the moment bewildered and lost. But the errand she had come upon quickened her faculties and inspired her with a desperate courage. Her first idea was to visit her husband and gladden him with her presence; and inquiring her way of different persons whom she met, she soon found the prison in which Antoine was confined. But, on requesting admission, she was informed that, without a special order from a magistrate, no person was permitted, under any circumstances, to visit or to have any communication whatever with a prisoner. It was terrible for her to gaze upon the stone walls of the prison, and knowing that her husband was confined within those walls, to be refused permission to see him. But wasting no time in useless lamentation, she hired a conveyance, and was driven to the abode of the *sous-préfet*, some little distance beyond the city. It was already late when she reached the house; but she rang the bell, and gained admittance.

Monsieur le Préfet had just dined, she was informed by a servant, and would see no person on business that evening; she must attend at the police court the next morning. But on her producing the letter from the mayor of Honfleur, the servant said that he would acquaint Monsieur with her presence.

The sous-préfet was seated at a table reading an evening journal, when the servant entered and informed his master that a young woman wished to see him on business of importance.

'At this hour!' exclaimed the préfet angrily. 'I cannot be disturbed. You should have told her so. Tell her to call at my bureau to-morrow.'

The servant withdrew, but presently re-appeared.

'What now, sirrah?' demanded the préfet.

'Monsieur,' replied the servant, 'the young woman will not go away. She says she must see you on a matter of life and death, and she bade me hand you this letter.'

With an exclamation of angry annoyance, the préfet glanced over the contents of the letter. 'Who is this woman? What does she look like?' he asked.

'She is very young, Monsieur, and seems to be in sore trouble. She told me she had travelled a long distance.'

'Well, well; show her up-stairs.'

The servant again withdrew; and in a few moments returned, accompanied by Madeleine, frightened, even amidst her sorrow, at the grandeur—to her eyes—by which she was surrounded.

'Enter, Madame,' said the préfet, who appeared to be surprised at the extreme youth and remarkable appearance of the young woman in her fisherwoman's garb. 'Pray, be seated, Madame,' he continued in a gentler tone of voice; 'and please to tell me briefly and clearly the object of your visit to Paris. I learn from my friend the mayor's letter that your husband is in prison, charged with complicity with Communism. My friend writes to assure me that he can certify that your husband cannot possibly be connected with the infamous Communists.'

'No; my husband knows nothing of the matter, Monsieur,' said Madeleine; and then she briefly told how it happened that he had visited Paris at this time.

'Then he arrived but three days ago, young woman?' said the préfet. 'His name? Ah!'—again glancing over the mayor's letter—'I see; Antoine Duroc. It strikes me,' he went on, 'that I have some recollection of that name.' He rose, went to a writing-table, and returned and reseated himself, glancing over the pages of a rough ledger or memorandum-book. As he did so, he read, as if to himself, yet loud enough for Madeleine to hear: 'Antoine Duroc, fisherman, aged twenty-three years, charged with inciting a mob to attack the military, and with having himself violently assaulted a soldier and released a prisoner who was under arrest. Denounced as a dangerous Communist by Lucien Pierrot.'

'This is a serious matter, young woman,' said the préfet to Madeleine; 'much more serious than my friend's letter led me to anticipate. It is out of my power to interfere in the matter, even if I had the wish to do so; and I have no

sympathy with the Communists, nor with individuals who incite others to offend against the laws'—

'Oh, believe me, Monsieur!' interrupted Madeleine, wringing her hands in an agony of distress; 'it is false that my husband is what you call a Communist. He knows not the meaning of the word. I have heard nothing of his having assaulted a soldier and released a prisoner. He said nothing of that in his letter to me; and I do not believe it is true that he has done such a thing. But, Monsieur, this man, Lucien Pierrot, is a vile wretch, who swears the lives of innocent men away for gain, and is unworthy of credence. He has vowed vengeance against my husband and me because I refused to listen to his base importunities;' and then blushing with shame amidst her distress, she related to the préfet the story of Lucien's conduct to her previous to her marriage. While she was speaking, the daughter of the préfet, a young and pretty girl of fifteen years, entered the room, and approaching her father, said: 'Dear papa, I am come to wish you good-night.' Then perceiving Madeleine for the first time, she became silent, and stood gazing pitifully upon the young fisherwoman from behind her father's chair.

'It is sad—very sad, my poor woman,' said the préfet, when Madeleine had ended her story; 'but, as I have told you, I have no power to interfere in the prisoner's behalf. Your husband is charged with a military offence. He will be tried by court-martial to-morrow morning. I dare not bid you hope for his acquittal. Such wretches as the man Pierrot are necessary to the government in such times as this. His oath will be taken by the members of the court-martial in preference to that of the accused, even though they regard the accuser with contempt. The trial will be brief, and the sentence of the court-martial will be immediately carried into effect. It is quite impossible for me to say or do anything in behalf of your husband that will be of the least service to him.'

'Ah, Monsieur,' sighed Madeleine, 'at what hour to-morrow will the trial take place?'

'At seven o'clock. It will likely be over by nine o'clock; and at noon the sentence of the court will be carried out. A great number of prisoners await their trial by court-martial to-morrow.'

Madeleine, weeping bitterly, threw herself on her knees before the préfet. 'Monsieur, Monsieur!' she cried, 'it is terrible. Men are wolves. They have no pity. But can heaven permit such injustice? Monsieur, as you hope for mercy on the last great day, intercede for my innocent husband! Save him, Monsieur, and I will pray for you, and will teach my innocent babe to pray for you and yours so long as we may live.'

'I pity you with all my heart,' replied the préfet, in a tone of deep sympathy; 'but again I assure you I can do nothing for you; I am powerless to help you. Paris is under martial law. The civil authorities are superseded for the time being by the military. I cannot interfere with the trial or sentence of a court-martial.' He advanced towards the suppliant young wife, and held forth his hand to assist her to rise; but Madeleine, overcome by the intensity of her affliction, fainted, and sank down on the floor.

The préfet rang the bell, and when the servant appeared, bade him send some of the female domestics to the assistance of the poor woman. The women came; and Madeleine, having partially recovered consciousness, was tenderly assisted from the room. 'Take care of her, poor creature,' said the préfet. 'Let her rest a while before she goes away; and if she will partake of it, give her some refreshment.'

'Poor woman! so young, and so pretty!' he soliloquised, when the servants had withdrawn with the agonised wife. 'I pity her sincerely; but I cannot assist her. Any interference on my part would be worse than useless.—Pauline, my love,' he went on, looking round for his daughter, whom he now recollected had entered the room while the young woman was kneeling before him.

But Pauline had disappeared; she had quitted the room with the servants and their helpless, sorrowing burden.

The sous-préfet did not resume the perusal of his journal. He was a man of kindly feelings, despite the hardening influences to which he was constantly subjected through his official position; and though he had his doubts, as men in his position always have in such cases, he was inclined to believe that Antoine had been falsely and maliciously accused. Yet he felt that he could not interfere in the prisoner's behalf.

At the end of half an hour, his daughter re-entered the room.

'Ah, Pauline, my darling, where hast thou been?' he cried. 'Thou wert here awhile since. Why didst thou go away, my child?'

'Papa,' replied the young girl, drawing near to her father, and placing her arm round his neck, 'I went after that poor young fisher-woman.'

'But the servants will take good care of her, my pet.'

'Yes, dear papa; but I took her to my own apartment and made her tell me *all* her story. She dared not tell you all. She was frightened, poor thing. O papa! it is so sad—so sad! I am sure, *quite* sure that the poor man is innocent of the political crimes imputed to him; and I have made the poor young wife promise to come here early to-morrow. I told her you would try to do something for her. And you *will*—will you not, dear papa, for my sake?'

'Pauline, darling, you have done very wrong; you have encouraged the poor woman to hope for assistance that I cannot render. I am powerless in the matter, as I have told her already—even if I were sure of the man's innocence.'

'Sure, papa!' exclaimed Pauline. 'Can you doubt? You will not doubt to-morrow, when you have heard all.'

'My darling,' answered the sous-préfet, 'no matter how strongly I may believe in the poor man's innocence, I can do nothing for him. He will be tried by court-martial in the morning, and in a few minutes will be either acquitted or condemned. They waste no time in these cases. If he be found guilty, as is most probable, he will be shot before noon.'

'Papa, you *must* do something,' persisted the young girl. 'There is always time till the last moment. You will restore the poor woman's husband to her.' Think over what I have said,

papa; and now, good-night;' and kissing her father, Pauline hastened from the room before the préfet could make any reply.

A RECEPTION AT THE VATICAN.

SINCE the establishment of United Italy, the Pope rarely leaves his own palace. Rather than occupy a secondary place in the marvellous city where his predecessors long sat supreme, and whence they ruled Christendom, he lives a life of splendid seclusion. The Vatican is an enormous pile of buildings adjoining St Peter's, comprising thousands of apartments, a hundred and fifty staircases, as also museums, and an almost fabulous amount of art treasures in painting, sculpture, and antiquities. Its exterior, though not beautiful, is imposing from its size; but on the interior is lavished everything that is magnificent and costly in adornment—the rarest and most splendid marbles, oriental alabaster, mosaic pavements—until the spectator is bewildered by the very extent of its richness. There are beautiful private gardens, in which the Pope is frequently carried in a sedan-chair; but at those times the public are rigorously excluded, so that the only opportunity of seeing him is by obtaining admission to an audience, and such permission is sparingly given.

On a certain Easter Monday morning, we set out for the Vatican in the dazzling sunlight of an Italian April; through the narrow, shady streets, with their picturesque groups of people, shifting and changing like the figures in a kaleidoscope. Soon we cross the Bridge of St Angelo, where Bernini's angels look on the yellow Tiber; then past the Castle of St Angelo with its look of hoary age; then lastly into the Piazza of St Peter, with its Egyptian obelisk and leaping fountains, half encircled by the immense colonnades which lead to the great church in the centre.

Descending from our carriage, and passing through the bronze gate, we enter the guardroom at the foot of the regal staircase, where the Guards, in their extraordinary dress of striped scarlet and yellow, are on duty. Our *permesso* was here inspected; and we then went up Bernini's beautiful staircase, with its fine columns and painted roof. After passing the equestrian statue of Constantine, we go through a bewildering succession of apartments and galleries, marshalled on at each turn by private servants of the Pope, in costumes of crimson velvet brocade. Next, we enter that wonderful series of frescoed chambers where the masterpieces of Raphael look down in colours scarcely faded since they left the great master's hand. On this occasion, however, one cannot pause to do more than glance at the 'School of Athens,' or the astounding 'Expulsion of Heliogorus from the Temple,' where the sacrilegious intruder seems absolutely hurled across the threshold of the sacred building. Last in succession is the Hall of Constantine, with the battle of the Ponte Molle, which changed the fate of the Empire from heathenism to Christianity. This Hall was painted by Giulio Romano, from Raphael's designs.

After passing through an antechamber, filled with chamberlains and other dignitaries, we were shown into the Geographical Gallery, where the audience was to take place. This Gallery, which

THE number of witty replies, ready retorts, and 'good things' generally attributed to Swift, Foote, Sydney Smith, Sheridan, and other departed celebrities, would doubtless considerably astonish those gentlemen, were they to return to life. Happy thoughts are not confined to acknowledged wits, however. Most of us have sometimes had occasion to say: 'What a good repartee such and such an answer would have been, had we only thought of it in time.' But there is the rub. It is not given to every one, perhaps fortunately for the general peace, to be as ready at retort, for example, as the critic to whom the following question was addressed by an artist: 'Don't you think it is about time I exhibited something?' 'Yes; a little talent, for instance,' was the reply.—To a grocer who had retired from business.

a friend said : 'My dear fellow, you are looking thin ; idleness does not agree with you.' 'Well, no,' instantly replied the grocer ; 'I don't weigh so much as I did.'

Another tradesman, a Quaker, who sold hats, was asked by a rustic the price of one. 'Fifteen shillings,' was the reply. The intending purchaser offered twelve shillings.

'As I live,' said the Quaker, 'I cannot afford to give it thee at that price.'

'As you live!' exclaimed the countryman ; 'then live more moderately, my friend.'

A tailor and his son were doing a day's work at a farmhouse. The prudent housewife, to secure a good day's work, lighted candles when daylight began to fade. The tailor looked at his son and said : 'Jock, confound them that invented working by candlelight!' 'Ay,' replied young snip, 'or daylight either!'—'You have no idea of the hard work there is in this business,' said a canvasser to a shopkeeper. 'I tell you it is either talking or walking from morning till night.' 'Beg pardon,' replied the victim. 'I have a pretty distinct idea of the talking part of your programme. Now, please favour me with an exhibition of the walking part.'

A sarcastic question may sometimes do duty for the severest of replies. 'I never consider a dinner perfect without soup,' said one man to another ; 'I always have soup when I dine.' 'And do you ever have anything else?' returned the other.—A punning retort is also at times very effective. 'I had no time to stuff the chicken,' apologised a landlady. 'Never mind, madam ; it's tough enough as it is,' quickly replied the boarder.—Another landlady, who tried to be smart, was as effectually silenced. 'I think the goose has the advantage of you,' she remarked to an expert boarder who was carving. 'Guess it has, mum, in age,' was the ready retort.

'Here, waiter ; what do you call this you've brought me?' inquired a customer.

Waiter. 'Ham, sir ; you ordered ham.'

Customer. 'When was it cooked?'

Waiter (snappishly). 'I don't know, sir ; we don't put tags on with the date and time of cooking!'

Customer. 'You ought to. This ham was cooked thirty or forty years ago. Bring me some that was cooked this year.'

The customer does not at all times have the victory ; sometimes it falls to the waiter. A bustling, fussy 'commercial,' waiting impatiently for his dinner, called out to the waiter : 'John, how long will that steak of mine be?' 'Why,' replied John quietly, 'about the usual length, sir—about eight inches.'

Two American gentlemen in the course of their travels stopped at a small café in the suburbs of Paris, for refreshments. Their repast was a light one, consisting of tea, toast, and eggs ; but the bill was a heavy one—nine francs in all. 'Garçon,' exclaimed one of the tourists, 'how's this? Please, explain.'

'Well you see, Messieurs,' explained the waiter—'two francs for the tea and toast, and seven francs for the eggs.'

'Ah, the eggs are very scarce about here?'

'No, Monsieur ; eggs are not scarce, but Americans are!'

'What do you mean by a cat-and-dog life?'

said a husband to his angry wife. 'Look at Carlo and Kitty asleep on the rug ; I wish men lived half as agreeably with their wives.' 'Stop!' said the lady. 'Tie them together, and see how they will agree!'—As ready, but more curious, was the reply of a nurse. She was telling about a man who had become so worn-out through intemperance that he could not keep any food on his stomach, when one of her listeners asked : 'What does he live on, then?' 'On his relations, ma'am,' was the answer.

The replies given by impulsive children when scolded and so forth, are often as apt as they are entertaining. In the country, for instance, a bright little girl was sent to get some eggs, and on her way back stumbled and fell, making sad havoc among the contents of her basket. 'Won't you catch it when you get home though!' exclaimed her companion. 'No ; indeed I won't,' she answered ; 'I've got a grandmother.'—'Sophy, if you don't be quiet, I shall have to whip you,' said the father of a large family, who always left the disagreeable duty of punishing the unruly to his wife. 'Pooh!' contemptuously retorted the little incorrigible he addressed, tossing her curly head—'you ain't the mother.'—'How old are you, my little man?' asked a gentleman of a youngster of three years, to whom he was being introduced. 'I'm not old,' replied the little man ; 'I'm almost new.'

Boys retorts are, as may be expected, generally of the rude kind ; as when a woman said to a youngster who had been impudent to her : 'Little boy, have you a mother?' 'No ; but Dad wouldn't marry you if there wasn't a house-keeper in the whole blessed land,' was the reply. —'Charley,' said a mother to her seven-year-old boy, 'you must not interrupt me when I am talking with ladies. You must wait till we stop, and then you can talk.' 'But you never stop!' retorted the boy.—Little Tommy was having his hair combed by his mother, and he grumbled at the operation. 'Why, Tommy, you oughtn't to make such a fuss. I don't, when my hair is combed.' 'Yes ; but *your* hair ain't hitched to your head.'

Equally pertinent was the answer given by a great musical composer to a remark. When a youth, he was clerk to a very rich but exceedingly commonplace, in fact stupid employer. One day, an acquaintance commiserated the clever lad on his position, saying : 'What a pity it is that you are not the master, and he your clerk.'—'Oh, my friend,' returned the youth, 'do not say that. If he were my clerk, what on earth could I do with him?'

Even clergymen cannot always hope to meet with the courtesy that draws the line at sharp rejoinders. 'If you can't keep awake,' said a parson to one of his hearers, 'when you feel drowsy, why don't you take a pinch of snuff?' 'I think,' was the shrewd reply, 'the snuff should be put into the sermon.'—Some years ago, we are told, the Isle of Sheppey being an inconsiderable parish, and the income not very large, the vicar came there but once a month. The parishioners being much displeased at this, desired their clerk, who was that year churchwarden also, to remonstrate with him as to his negligence. The clerk told the vicar the wishes of the parishioners ; and the reply was : 'Well, well ; tell them if they

give me ten pounds a year more, I will come to see them once a fortnight; and be sure to let me know their answer the next time I come.' The next time he did come, he accordingly asked, and the clerk answered: 'Sir, they say as how if you will excuse them ten pounds a year in their tithes, they will dispense with your coming at all!'

Members of the cloth are not always above severely criticising one another's failings. It is related of that most eloquent of English clergymen, Robert Hall, that he once—disgusted by the egotism and conceit of a preacher who, with a mixture of self-complacency and impudence, challenged his admiration of a sermon—was provoked to say: 'Yes; there was one very fine passage of your discourse, sir.' 'I am rejoiced to hear you say so; which was it?' 'Why, sir, it was the passage from the pulpit to the vestry.'

The legal profession may naturally be expected to develop the powers of repartee. There is a well-known anecdote of a judge saying, 'One at a time, gentlemen,' when a donkey brayed outside the court just as a lawyer was eloquently holding forth; and that the lawyer retaliated later on by remarking, 'There was a strange echo in court,' on the judge, when interrupted, absently inquiring the cause of the very same noise.

Another story, in which the same too often despised animal figures, may not be so well known. A country Laird, who had lately been elected to the office of a county magistrate, meeting a clerical gentleman on horseback, attempted jocularly by remarking that he was more ambitious than his Master, who was content to ride upon an ass. 'They canna be gotten noo,' said the minister; 'for they're a' made justices of the peace.'

Even lawyers, with all their smartness and assurance, don't always come off best in a wordy duel. An attorney said to an Irishman, his client: 'Why don't you pay me that six-and-eightpence?' 'Why, faith, because I do not owe it to you.' 'Not owe it to me? Yes, you do; it's for the opinion you had of me.' 'That's good, indeed,' rejoined Pat, 'when I never had any opinion of you in all my life.'—Equally good was the retort made to Serjeant Cockle by a witness. In a trial of a right of fishery, he asked the witness: 'Don't you love fish?' 'Ay,' replied the witness, with a grin; 'but I dunna like Cockle sauce with it!'

An agent canvassing a voter and getting many evasive replies to his cross-examination, at last exclaimed sharply: 'Confound your quibbling! Tell me, then, what your opinions are—your conscientious opinions, I mean.'—'They are the same as my landlord's.'—'And what are your landlord's opinions?'—'Faix, his opinion is that I won't pay him the last half-year's rent; and I'm of the same opinion myself.'

The Irishman who on asking an intruder in his cabin what he wanted, and receiving the answer, 'Nothing,' said he would find it in the jug where the whisky was, had an equal in promptness in a New-Yorker, whom an 'uncertain' acquaintance addressed as follows: 'I'm a little short, and would like to ask you a conundrum in mental arithmetic.'—'Proceed,' observed the gentleman.—'Well,' said the 'short' man, 'suppose you had ten dollars in your pocket, and I should ask you for five dollars, how much would remain?'—'Ten dollars,' was the prompt answer.

'What do you mean by standing there with your hands in your pockets?' asked an employer, addressing a rather indolent workman. 'Nothing much; 'spect you'd be making a noise if I had them in yours,' replied the incorrigible.—'Did you get her photo, when you were away?' said one Freshman to another. 'Well—ah!—the fact is,' returned his companion, 'she gave me her negative.'

'How did you learn that graceful attitude?' said a gentleman to an intoxicated fellow leaning in a maudlin fashion against a post. 'I have been practising at a glass,' was the reply.—Remarkable quickness at repartee was displayed by an actor at the Belleville theatre, when some one threw the head of a goose on the stage. Advancing to the front, the player said: 'Gentlemen, if any one amongst you has lost his head, do not be uneasy, for I will restore it at the conclusion of the performance.'

Not many would feel in much humour for joking, we should think, after the excitement of catching a thief in one's house, yet here is an instance to the contrary. A burglar was caught by a gentleman in the back drawing-room, and a policeman sent for at once. 'You ought to be grateful to me,' said the thief, 'instead of treating me like this 'ere. I only came in to tell you the front-door was open, and I was afeared you'd get robbed.'—'Excellent reasoning, no doubt, my friend,' said the householder; 'but on wrong premises, I fancy!'

A lady who asked a sailor why a ship was called 'she,' received the ungallant reply, that it was because her rigging cost so much.—Equally smart was the reply of the sea-captain who was invited to meet the Committee of a Society for the Evangelisation of Africa. When asked: 'Do the subjects of the king of Dahomey keep Sunday?' he replied: 'Yes, and everything else they can lay their hands on.'

Perhaps as much presence of mind as shown in any of the above instances was displayed on the following occasion. A young gentleman getting into a railway carriage, happened to press the foot of a young lady who was sitting next to the door. The damsel, contracting her pretty brow into a frown, ejaculated: 'You clumsy wretch!' Many men would have looked foolish and apologised; but he exclaimed: 'My dear young lady, you should have feet large enough to be seen, and then they wouldn't be trodden upon.' Her frowns instantly changed into smiles, and the injury was forgotten.

FAIRYLAND AND FAIRIES.

WHERE is Fairyland? There are no finger-posts anywhere pointing to it. It is not in Murray's Guides. But—how, we hardly know—we are sometimes lucky enough to be taken thither by the poets and the children; for, oddly enough, the poets and the children are like each other, and often walk the same way. True, the Scientific Societies would reduce Fairyland to an exhalation of fancy, and blow the fairies off in vapour. But we object to seeing our most precious conceptions resolved into their original elements and then destroyed beyond help; though we should like to know, in the proper place and season, how those same conceptions originate, and even

what stuff they are made of. So we leave the learned wights with their destructive crucibles; and as becomes pilgrims to Fairyland, choose our company among more ardent and simple folk—the poets and the children. Where, then, is Fairyland, and why does it exist?

Chaucer places the realm of Faëry underground with Pluto and Proserpine. In the old days of romance, knights found it in the ocean island of Avalon, where, stepping ashore in darkness from wreck to wreck, they entered the lighted castle, peopled by beautiful maidens and men transformed by enchantment. In Spenser's time, this realm could not have been so far off, for he saw in it the shadow of England. A little later, Drayton imagined it high in air, poised by magic midway between the earth and the moon, with an aerial route, *vid* the moon, down to this world. His minute touch built up the palace with walls of deftly mortised spiders' legs; and all its architectural arrangements, chiefly of insect material, were the strangest ever imagined:

The windows, of the eyes of cats;
And for the roof, instead of slats,
Is covered with the skins of bats
With moonshine that are gilded.

No doubt it was from such a palace, but with more of beauty and less of the grotesque in its furniture, that Tom Hood's fairy, after two centuries and more, began to come down the moon-beam-path, bringing the dreams of little children. She uses the old road that Drayton found; but her lightness and brightness are beyond his fancy:

A little Fairy comes at night;
Her eyes are blue, her hair is brown,
With silver spots upon her wings;
And from the moon she flutters down.

Drayton's courtiers and ladies of 'the Fairy court' were little creatures that could huddle together and hide in an empty nut-shell; and littleness and lightness are by this time permanent attributes of the fairy creation. But in the early history of Fairyland, its people were of larger growth. In the old Gallic and Breton romances, they were merely men and women possessed of magical powers; and in Brittany—a country intimately connected with the rise of Fairyland—the fairies, that are supposed to haunt the *landes* and glide round the Druidic stones by night, are not tricky elves, but tall maidens of more than mortal stature, willing to enchant and marry mortal men.

Before the Elizabethan age, while the fairies were holding their own, and growing rather than dwindling in Western France, the merry sprites and elves were in England driving the full-grown enchanters from the field. But with Shakespeare came a patent of immortality to the little harmless crew. He left the bounds of Fairyland indefinitely fixed; but he fixed for ever as the property of the poet the most picturesque parts of the popular belief. For evermore the 'shrewd and knavish' Puck was to be 'the merry wanderer of the night,' with an historic reputation for destroying the peace of village maids and housewives; tangling the skein of love among mortals; enjoying their discomfiture at his wiles, and even setting them astray when he means well. Evermore, Oberon and Titania will preserve in poetry their character for miffs and tiffs, love and

jealousy, almost in play—a bright-coloured reflection of human passions, without their depth or their sorrows. And evermore the fairies will have their allotted work to do, making elves' coats out of the leathern wings of bats, teasing away the owl that hoots and wonders at their revels, dewing the rings that are to be danced on at night, and killing cankers in the rose-buds; and henceforth they will always be small enough to creep into acorn-cups. By *A Midsummer Night's Dream*, Fairyland became an indestructible reality in the region of fancy; through poetry the cultured must know it for ever, even when the unlettered, who once believed in it most, may forget it completely.

The poets and the children have kept up this race of beautiful imaginary beings for the very same reason. Both have strong imagination; both in a different manner have an attraction towards wonders and bright fancies; to both the commonplace is but dull ground. The early poets and writers of romance embalmed the popular beliefs for the sake of the facility they afforded for exercising invention in describing the marvellous, and for the easy working out of stories of wonder. The children have the same delight in the marvellous, and the same preference for a tale wherein the most startling wonders are possible. To the first writers who chronicled fairy achievements, in the time when Faëry only signified something of 'glamour might,' this wonder-working was not so great a strain upon the fancy of reasoning minds, as it is now in these more scientific ages. In the same way the marvels of children's tales are interesting to the inexperienced listeners, because they do not seem so wildly impossible as to forbid interest. It has been well said that a little child in a garden would not be much astonished if a stone urn changed into a dragon among the grass; though in truth, science has greater wonders in store for the child yet, and travel has more beautiful sights to astonish him, than are to be found in any magic changes, or in the fancied picture of a fairy tale. Very strangely, too, we send the word back to its mediæval meaning when we name many of the nursery stories, *fairy tales*; for stories like *Red Riding Hood* do not deal with fairies, but with marvels. Until the nature of children—that is, until human nature—changes, stories of wonder will be craved by the young; and until our ideas of poetic thought become completely altered, there will be space kept in the realms of poetry for the bright airy creatures that live in moonlight, familiar with flowers and insects.

From the maturer popular belief, they are fast fading away. Weakly and puny infants are no longer supposed to be fairy changelings, except in districts so remote that the newspapers cannot reach them, nor the new broom of the School Boards sweep them clean. Even the fairies of the Border, about whom Sir Walter Scott told us, and the fairies of the Sister Island—familiarly yet deferentially called 'the good people'—are fast vanishing for ever. It is Fairyland itself that cannot be destroyed, since the *Midsummer Night's Dream* is immortal with its quaint fancies, and human childhood with its needs. As for the Fairyland of the Christmas theatres, it is but an imperfect imitation of the original.

In the lath-and-canvas Fairyland, with stage carpenters, ropes and pulleys, lime-lights and ballet-girls, there is produced in the transformation scene a certain amount of beautiful scenery changing under many-coloured lights. But the moonlit elfin scene 'laid like a dream upon the green earth's lap,' is very different from the spectacle in glare and heat behind the footlights; the studied dance of the *corps de ballet* is not the circling roundel among grass and mushrooms; the artificial fairies are not like the happy sprites of Nature that do kind turns to drooping flowers, and have a speaking acquaintance with every insect.

As unlike in the opposite extreme, but perfectly original and charming, was the well-known Fairyland in the cloud region above the 'Wicked World,' devised in contrast to the land of ballets, and as a shadow of a more real world off the boards and beneath the clouds. 'A pleasant dreamy land, with no bright colour in it—a land where it is always bright moonlight—a land where there is nothing whatever to do but to sit and chat with good, pleasant-looking people, who like a joke, and can make one, and can take one too—a land where there is no such thing as hunger, sleep, fatigue, illness, or old age—a land where no collars or boots are worn—a land where there is no love-making, but plenty of innocent love ready-made.' This most pleasant of all invented Fairylands is peopled by women supremely lovely—a return to the oldest Fairylands of romance, but with some difference of manners and customs. 'They wear long robes high in the throat, falling loosely and gracefully to the very feet, and each fairy has a necklace of the very purest diamonds. They have wings—large soft downy wings—six feet high like the wings of angels;' and by some spiritual contrivance, it is stated, these wings do not crackle or crumple under the fairies when they sit down.

We should like to hear more tales of such Fairylands with fairies of homely name—Fair Mary the Queen, and Mattie, and Kate; but so far, this is an excellent example of the breadth of invention possible in dealing with fairy nature, and the flights of fancy that yet may come when the name is merely used to suggest the fair and the marvellous in an unearthly creation. How it is that fairies in even the wildest fancies must be fair unless they be evil, is hinted as far back as the old romance of *Lancelot du Lac*, where we find the origin of their universal beauty. At that time, says the romance, all were called fays who dealt in charms and enchantments, and many such there were in Great Britain; and knowing the power and virtue that lies in wood, stones, and herbs, they were able to be young, beautiful, and richly dressed, just as they devised. It seems rather a pity to interfere with this beautiful race, and take their splendour to pieces, by disputing whether they were *peris* of Persia, or Hebrew spirits, or Roman Fates, or Gallic *fées*, in their first origin; whether they were the nymphs and fauns with which untaught races were wont to people the woods and fountains, and by whose doings they interpreted Nature's mysteries; or whether, as one theory goes, they were puny cave-men, who descended upon their civilised neighbours from seemingly mysterious regions, and from a still more mysterious

life. The analysis of their name, or the questions of psychologists as to why man's mind invented them, after all leaves room for more poetic and more childlike musings about the bright tradition; and wherever they came from, but one thing is certain—that they belong in a peculiar manner to the poets and the small folk. These have appropriated Fairyland, for good reasons of their own, as we have seen; and in their possession the old tradition has yet to develop in the future, perhaps through inexhaustible phases of the fantastic and the beautiful.

And even when the poets, professionally so-called, have given up the fairies, and have ceased to wave magic wands over the land where fairies dwell, we feel sure the children—'your only true poets,' as Macaulay says—will remain faithful to the old beliefs; and little eyes will sparkle, and little faces brighten as of old, when the beneficent fairy-form is once more conjured up before them, to relieve some persecuted hero in his sore distress, or to spread protecting wings round some beautiful heroine whom bad sisters hate, and ugly witch-women seek to destroy. More than this, it would be wrong to deprive children of their fairy intimates, even had we the power to do so. It would indeed be an act of positive cruelty. It would be depriving many a sensitive, imaginative child of its chief source of comfort and pleasurable reflection amid the little cares, and tiny, but not less real vexations, of its child-life. The belief in the good spirits called Fairies is with children a kind of religion—often more sincere and pure-hearted than much of our grown-up religion is; and the consciousness that these bright-eyed, sylph-like creatures, with their snow-white drapery and their angel-wings, are ever hovering around in love and tender pity, brings hope and sweet comfort to the darker and sadder hours of many a little life, and opens out the child-heart in its time of trouble as the sunshine of morning opens out the daisies.

SHADOWS.

A BURST of golden sunshine,
A whispering of the leaves,
A music-ripple on the brook,
A joy, a wonder in each nook;
A sweeping shadow o'er the land,
A flushing of the tree-tops,
A crimsoning of the lake,
A peaceful mildness in the air,
A thought of hidden mysteries there,
A glorious fading of the sun—
A summer's day is done.

A joy in childhood's playthings,
A casting them aside;
A flash of golden youth-hood's hour,
When joy breaks through the passing shower;
A castle-building in the air;
A cherished hope defeated;
A smile, a joy, a doubt,
A gleam, reflected from the past;
A sigh upon its bosom cast;
A mystery of a world unknown;
And then—a soul has flown.

THE RACE ACROSS THE ATLANTIC.

FORTY-FIVE years ago a steamer named the *Great Western* lay fitting out in the harbour of Bristol. She was of no great size according to our ideas, being only two hundred and twelve feet long; but the eyes of the mercantile world were directed to her, as she was the first steamer built for service on the Atlantic, and the interest was all the greater that the question was not, How long will she take to make the voyage to New York? but, Will she manage to steam across the Atlantic at all? There are still among us those who can tell of the eager expectation with which the result of the attempt was awaited; and the rejoicing that took place when the news at last reached our shores, that on the 23d April, 1838, the *Great Western* had arrived in safety at New York, and that the great problem of ocean steam-navigation was solved.

It is nearly half a century since then; but the interest taken by the British public in the doings of the Atlantic steamers has never flagged. Every fresh addition to the fleet of one of the leading Companies is honoured by a paragraph in the newspapers; the illustrated periodicals give woodcuts, showing the ship in question careering along in a rolling sea under full steam and with all sail set; she is opened for inspection, and thousands flock to admire her saloons and deck arrangements, or to gaze open-mouthed at her immense engines. She starts on her maiden voyage, and the shipping intelligence column is scanned day by day; and when eventually the news comes that she has, by some odd minutes, made the fastest run on record, it is echoed to the farthest extremities of the land.

It is this interest on the part of the public in the steamers of the great rival Companies that contest the honours of the ocean, which induces us at this time to give a slight sketch of the history of the Atlantic steamship traffic. Naval architecture is to a large extent an experimental science; the law of the survival of the fittest, whatever be its power on shore, is absolute on the

high seas. This is in no case better illustrated than in that of the Atlantic steamship the *Great Western*, the clumsy appearance of which may be seen in the engravings of the period, bearing but little resemblance to the graceful outline of a modern liner. The steps by which this great change has come about we shall now attempt to follow.

The *Great Western* of 1838 was a wooden paddle-steamer of twelve hundred tons, rigged with four masts and a very pronounced funnel, the standard type, however, of the period. Unlike most first attempts, she proved a success both as to her sea-going qualities and financially. Forty guineas were readily paid as passage-money in her saloon; and five pounds per ton freight for goods was not at all out of the way; while the passage from Bristol to New York averaged sixteen days one hour, and the homeward run thirteen days seven and a half hours.

No sooner did it become evident that the navigation of the Atlantic by steam was a success, than the question of carrying the mails came forward. Tenders were asked; and that of Mr Cunard of Liverpool being accepted, four new steamers specially designed for the traffic were ordered. These four steamers were built on the Clyde; and in the summer of 1840, the first of them, the *Britannia*, began to run. Before long, a monthly steam-packet was despatched from Liverpool to Halifax, Nova Scotia. In these days the estimate of the requirements of the mail and passenger service between the two continents was decidedly moderate, as four steamships of only eleven hundred and forty tons each were thought sufficient. But before ten years had elapsed, the new Company, now celebrated as the 'Cunard Line,' had tripled the number of their vessels, increased the total tonnage fourfold, and established regular services to New York and Boston.

The year 1845 is memorable in the annals of Atlantic steam-navigation, as during it the first iron screw-steamer began to run. This was the *Great Britain*, a truly wonderful vessel for her day. Her breadth was fifty-one feet—one

foot less than that of the *City of Rome*; and her length two hundred and eighty-nine feet. While her speed was equal to that of her paddle-wheel rivals, her working expenses were relatively less; and the public came in for the benefit in the shape of reduced fares. The *Great Britain* continued in active service, although not on the Atlantic, long after her wooden contemporaries had been consigned to the breaking-up yard, and quite recently was an object of interest as she lay in the basins at Birkenhead.

For nearly ten years after the *Great Western* had led the way across the Atlantic, British-built steamships had a monopoly of the traffic; but in 1847 the Americans bethought themselves of winning honour; and accordingly, after their national style, in June of that year a native-built steamship named the *Washington* was started to run alongside the *Britannia*. Any amount of 'tall talk' heralded the event; but in the result the *Britannia* arrived two clear days before her rival. The lesson was not thrown away on Brother Jonathan: full particulars of the best steamships of the Cunard Company were obtained; larger vessels, with still more powerful engines, were designed and placed on the stocks; and in May 1850, the *Arctic*, the first steamship of the once famous 'Collins Line,' arrived at Liverpool. This vessel was two hundred and seventy-seven feet long, and two thousand eight hundred and sixty tons; the *Asia*, the favourite Cunard liner of the day, being two hundred and sixty-six feet long, and two thousand two hundred and twenty-six tons. Starting with the valuable experience of ten years of Atlantic steaming, it is not to be wondered at that the 'Collins' steamers were a success as far as sea-going was concerned. The results of the running between Liverpool and New York for the twelve months ending June 1852, gave an average for the Cunard of twelve days six hours forty-one minutes out, and ten days seventeen hours thirty minutes home; while the Collins averaged eleven days fifteen hours two minutes out, and eleven days home—thus showing an advantage of four and a half hours on the average out and home in favour of the American ships. Great were the rejoicings on the other side of the Atlantic; but the fact that the *Arctic* and her sister-vessels had cost far too much money ever to prove commercially successful, was completely lost sight of. The Cunard Company did not give up the contest, however; but, like Britons, set to work again. In 1852 the *Arabia*, a steamer two hundred and eighty-five feet long, two thousand four hundred tons register, and more powerful than the best of the Collins Line, began to run; and three years later, the *Persia*, an iron steamer, three hundred and fifty feet long, and three thousand seven hundred and sixty-six tons—the largest vessel then afloat—was added to the fleet. The *Persia* soon made her capabilities known; she averaged eleven days two and three-quarter hours for the passage out, and nine days fourteen hours home. The average passage of the Cunard fleet was reduced to five hours under that of the Collins; and the laurels of the Atlantic passed to the British, with whom they have since remained.

For several years longer the American Company kept up a gallant struggle; but misfortune attended it; the *Pacific*, one of their steamers,

disappeared at sea in the winter of 1856; the others did not pay expenses; and Congress finally withdrawing the subsidy which it had granted, the Collins liners in 1858 ceased to run.

The year 1850 saw another and more successful competitor to the Cunard Company in the *City of Glasgow*, a vessel of sixteen hundred tons, the pioneer steamship of the now famed 'Inman Line.' This vessel, as were all her successors, was a screw-steamer; and to the superior economy of this system is no doubt largely due the fact that the Inman Line, supported only by private enterprise, prospered during the same years that the Collins Line, backed by a government subsidy and the good-will of a nation, went to the wall. At the close of the year 1860, the fleet of the Inman Company numbered nine vessels, with a collective tonnage of seventeen thousand seven hundred; and the voyage between Queenstown and New York was performed by these in the average time of thirteen days nine hours forty-five minutes out, and eleven days twenty hours twenty-five minutes home. The advantages of Queenstown as a port of call were early recognised by this Company, whose steamers have called there regularly since 1859.

Galway, on the western coast of Ireland, stands at the head of the large and well-sheltered bay of the same name. Railway communication was opened to it from Dublin in 1851; and in the following years the possibility of making it the point of departure of the American mail was under discussion. A Company of Irish gentlemen was eventually formed; an offer to establish a line of steamers and carry the mails for a very moderate subsidy, was made to government; and in April 1859 the 'Royal Atlantic Steam-navigation Company' signed a contract to carry the mails from Galway to New York in eleven days two hours, and home in ten days. Four large steamers were forthwith ordered, and the service was opened in June 1860; but everything went wrong, one disaster after another occurring to the fleet. The purchase of the *Adriatic*, the crack steamer of the then recently defunct Collins Line, did not retrieve the position; and after only eleven months' running, the Company was wound up, and the prospect of Galway becoming the Liverpool of Ireland was crushed for a generation.

During the years 1860-61, the *Great Eastern*, the largest ship in the world, was tried as an Atlantic packet; but the experiment was too gigantic for the time; passengers were not forthcoming in sufficient numbers to occupy her hundreds of staterooms, nor cargo sufficient to fill her capacious holds; her working expenses, too, were heavy; and finally this unfortunate vessel was withdrawn.

In 1862, the *Scotia*, a paddle-steamer, three hundred and seventy-nine feet long, and one-fourth greater tonnage than her predecessor the *Persia*, was added to the Cunard fleet. This well-known ship, the last paddle-steamer built for service on the North Atlantic, and perhaps the largest of her type ever built, was for long the favourite on the route. She averaged after ten years' service nine days twenty hours Queenstown to New York, and nine days five hours home; and at the present moment, under the same name, but with altered appearance, being now fitted with a twin screw,

she does good service in the employ of the Telegraph Construction and Maintenance Company.

The 'National Steam-navigation Company' was established in 1863, and for some time took the lead in introducing long ships. Starting with the *Holland*, of three hundred and ninety-five feet, in two years' time they added the *England*, four hundred and thirty-eight feet long, a vessel which for seven years was unsurpassed in size by any other steamer on the Atlantic service.

The fourth in seniority of the Liverpool and New York steamship Companies, the *Guion Line*, was established in 1866, their first ship being the *Manhattan*. The vessels of this Company have recently become noticeable for their size and speed.

The year 1870 brought into the field a formidable rival to the older lines in the 'Oceanic Steam-navigation Company,' popularly known as the 'White Star Line.' The vessels of this Company were specially designed with a view to minimise the time of passage between the two continents, and were highly successful; the result of the running of the White Star liners between Queenstown and New York for the year 1873 giving an average of nine days nineteen hours forty-eight minutes out, and eight days twenty-two hours thirty-nine minutes home. The Cunard fleet during the same year averaged ten days sixteen hours fifty-four minutes out, and nine days seven hours fifty-nine minutes home; and the Inman in 1870 averaged ten days fourteen hours twenty-two minutes out, and nine days sixteen hours eight minutes home. It was clearly necessary for the senior Companies to keep pace with the times. A season of active building resulted, and by the close of 1875 the Inman Company had added to their fleet four splendid steamships, of a total tonnage of nineteen thousand two hundred, the last and largest being the *City of Berlin*, four hundred and eighty-eight feet long, the largest ship then afloat excepting the *Great Eastern*. During the same period the Cunard Company built the well-known favourites *Bothnia* and *Scythia*; but the Oceanic Company produced the *Britannic* and *Germanic*, and so the White Star still led the way.

The well-remembered years of commercial depression followed, during which the Atlantic trade suffered as much as any other; but in the middle of the dull time, the Cunard Company, believing that a business that had prospered in their hands for nearly forty years had still a future, prepared for a revival by building the *Gallia*, one of the finest of their present fleet, and fully a match in speed for any other vessel then on the Atlantic.

The *Guion Line* now came to the front for the first time, and the famous *Arizona* attracted crowds at Liverpool, as she returned from the 'fastest passage on record.' Business brightened, and a season of building again commenced. The Cunard Company kept up their reputation with the *Servia*, five hundred and fifteen feet long, and ten thousand five hundred horse-power, beyond dispute the most perfect Atlantic steamship yet produced, being built of steel, and having her safety well provided for in her complete double bottom and numerous water-

tight bulkheads. The Inman Company built the *City of Rome*, five hundred and sixty feet long, and eight thousand four hundred tons, a larger vessel than the *Servia*, but with no greater power; while the owners of the *Arizona* prepared to eclipse everything with the *Alaska*, a vessel two feet less beam, and fifteen feet shorter than the *Servia*, but with practically the same power. These three vessels made their first voyage towards the close of last summer; and in order to watch their effect in reducing the time of the Atlantic passage, we note that during 1880 the White Star steamers averaged nine days and twenty-four minutes out, and eight days seventeen hours twenty-six minutes home; the Inman, the only other Company of which the results have hitherto been made known, averaging nine days nine hours thirty-two minutes out, and nine days three hours home.

During the present summer, the rival steamers are all being well and fairly tested, and the interest, in their speed especially, never seems to flag. In the beginning of June, the *Alaska* made the run to Queenstown in six days twenty-one hours thirty minutes, and subsequently from Queenstown to New York in six days twenty hours, thus more than realising the long-awaited-for seven days' passage. The *Servia*, as tried on the measured mile, ran a trifle under eighteen knots; and the *City of Rome*, with her elaborate six-cylinder engines, may possibly rival this speed. The distance from New York to Queenstown may be taken at two thousand seven hundred and ninety nautical miles; to make the passage, therefore, in seven days requires an average speed of sixteen and two-third knots per hour—a high speed certainly, as the fast Kingston and Holyhead mail-steamers average no more than sixteen.

We have as yet spoken only of those Atlantic steamship Companies whose vessels run from Liverpool to New York, as it is to these alone that the competition in speed, so far as British-owned steamers are concerned, has been made. Our sketch, however, would not be complete without a short reference to other Companies, whose steamers, although not specially renowned for quick passages, have done excellent public service.

Amongst these we may mention the well-known 'Allan Line,' which from the year 1856 has kept up a regular service of steamers to Quebec or Montreal in summer, and Portland, Maine, in winter. The Allan Line runs steamers both from Liverpool and Glasgow, and now possesses a fleet equal, so far as efficiency and the comfort of passengers are concerned, to any other on the Atlantic.

The equally well-known 'Anchor Line' commenced in a small way in 1856 running between Glasgow and Quebec; and nine years later began the present service to New York. A steamer of very modest dimensions, despatched once a fortnight, was then sufficient for a trade that has developed to such an extent that recent summers have seen two Anchor liners of four thousand tons each, besides a supplementary steamer, leave the Clyde for New York in a single week, laden in many cases with emigrants. Economy is the order of the day in the North, the rates both for goods and passengers being usually less—often

considerably less—than those from Liverpool; and during the last few years, thousands of emigrants from Northern and Central Europe have travelled *via* the Leith and Glasgow route to find a home in the Great West.

Within more recent times, the 'State Line' started with a well-equipped fleet to compete with the 'Anchor,' and has had a fair share of public favour. The 'Monarch Line,' running between London and New York, is as an undertaking in its infancy. The steamers of this Company were designed largely with a view to the carriage of live-stock; and it may be remembered that the much-talked-of Jumbo left our shores as a passenger in one of them. At Bristol, within the last few years, we have seen in the revival of the once famous 'Great Western Steamship Company' an attempt, we are happy to believe so far successful, to bring again a portion of the tide of commerce that once flowed from the West through the old city on the banks of the Avon. The go-ahead Cardiff has tried a line of steamers on its own account; we are unable to say with what degree of success; and the wonderfully developed port of Barrow owns another, running in conjunction with the Anchor Line.

The South Coast of England is well supplied by the Companies whose headquarters are at Havre, Rotterdam, Bremen, and Hamburg, the steamers as a rule being British-built. Grimsby also comes in for a share; and on the whole we may say that if any resident in the British Isles has a desire to cross the Atlantic, he has no cause to complain of want of means of transit.

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

CHAPTER XXVIII.—A MESSENGER FROM THE BANK.

GARLING meanwhile was in the street, walking to the Bank. To be free as he was and yet bound as he was, seemed an anomaly. He was going to surrender all his evil gains, and he was no worse nor better off than if he had lived a life of honesty, except in the estimation of men for whom he had no regard. The physical conditions were perhaps answerable for a part of his indifference. He was too worn out to feel keenly.

The usual greetings met him as he walked, and he responded to them in his usual way, by bending his bent head a little lower. Eminent capitalists remarked that morning that Garling was looking worn, and afterwards speaking in the light of later events, called upon other eminent capitalists to corroborate their assertions that they *had* made that observation. With no change in his common business manner, Garling secured the necessary forms, and returning, filled them up at his own table, sitting in the visitor's chair and facing the wonder-stricken Mr Barnes. Every now and then the promoted officer glanced at the resigned or—dismissed? Surely that last was impossible. Garling the long-headed, Garling the keen, the imperious, a match for any ten cashiers and managers in the City for acumen

and knowledge of the world, the pearl of business men, dismissed? Impossible. And Garling's manner set that thought at rest. He was just the same as ever, except that he had been used to be always so busy, and was now, by way of added wonder, idle.

When he had filled up the necessary forms and had everything ready for the merchant's inspection and use, he took up the daily paper which lay upon the table and feigned to read it. So far as he was concerned, it was an idle feigning, for he scarcely had the heart to read a word, but he sat there with stupendous patience and self-control and made no sign. Mr Barnes was evidently agitated by extreme curiosity; and Garling, though he had no particular purpose in foiling him, yet found the baffling of that curiosity a help to him. It whiled away the time, and suited the purposeless weary venom of his mood to sit there impassive and worry Barnes, and occasionally to meet Barnes's secret glance of wonder with one of keen discovery, and to make him uncomfortable in that way. But the fire of Remorse which in some hearts is only to be lighted by failure, was already in this pause beginning to burn in him, and to bring him a foretaste of its agonies. He had failed! In the very hour of his triumph he had failed. There was nine years' work wasted—thrown away. On the very results of his fraud, the great House would prosper, for he had worked for its prosperity that he might make his fraud the larger. Let him care as little as he might, let him be as indifferent as he would, it was ignominious. He had failed.

Failure is always bitter, but it is ten times bitter to the detected rogue. And now his own ingratitude began to gnaw at him; a crime spurned by his steel-armed conscience this nine years past, crept in through a crevice in the shattered armour and began to gnaw at him. And shame wreathed a first cold coil about his heart and sickened him. Then one thought suddenly took him by the very soul. This vengeance came upon him through his desertion of his wife and child, and one crime was made a whip to scourge another. *Was* the world a chaos of chances, after all, if such a thing as this could be? It was clear that Lumby had overheard the colloquy between that insolent Yankee and himself; clear that this had excited suspicion in his mind; clear that he had that night disturbed the ledger which held the account of Garling's first year of stewardship, and so had detected him. This heaped bitterness on bitterness, and set the sting of his long-deadened conscience to bite deeper. Bah! Why distress himself about that world-old superstition, long since destroyed by philosophy, and condemned by common-sense? Yet he could not shake off the fear, and it dug at the foundations of all his strength; for if it were truly founded, he had thrown away more than a rare plot and lost more than a great fortune.

Twelve o'clock at last.

'Mr Barnes,' said Garling, with an unconscious use of his old habit of command, 'be so good as to tell Mr Lumby that it is mid-day, and that I am ready for him.'

Mr Barnes, with an unconscious use of his old habit of obedience arose and tapped at the

sliding panel. No answer. He tried to thrust it on one side; but the bolt was fastened. He rapped again, more loudly. No answer. He went round to the side-door and rapped at that, and still receiving no response, essayed to open it, but discovered that it also was fastened.

'He must have gone out,' said Barnes, returning; 'but I did not hear him.'

'Nor did I,' returned Garling. So that he performed his share of the contract, what did it matter to him whether the merchant kept his or left it unkept? If he chose to be ruined, let him be ruined. He would want money at the Bank soon enough, unless Garling were mistaken, and that could not come about very easily. The new cashier and the old sat on together until the luncheon-hour, when Mr Barnes went out. At two o'clock he returned, and sat down before a new pile of letters. One of these he handed to Garling.

'This concerns you, Mr Garling,' he said. It was Garling's roundabout note to Lumby, returned by the Liverpool firm, as having been inclosed to them in error. 'Clumsy fool!' said Garling to himself, not taking time to think that it mattered no longer. 'Why not have sent it straight on without inclosing it?' Then he smiled bitterly at his own want of apprehension, and absently tore the useless fraud across and threw it into the waste-paper basket. This futile reminder of all his futile plans stung him a little. There were stings enough within him, but he would not writhe. Mr Barnes was looking to see whether this odd note had any effect on Garling, but the defrauder held himself and gave no sign. When men came to know that he was defeated, they should have no chance to say that they had seen him shaken by defeat.

Another hour went by, and Mr Barnes, at Garling's bidding, again rapped at the sliding panel, and again tried both it and the door with no result. A new alarm was presenting itself to Garling. It was patent that if matters went too far, and the firm was shaken, the promise of immunity he held might after all avail him little. He sat thinking uneasily of this for another half-hour, and had almost resolved to rise and batter at the door until he received an answer—for he was certain that the merchant had fallen asleep within—when a clerk came hurriedly up announcing the arrival of a messenger from the Bank, who wished to see either Mr Lumby himself or Mr Garling on business of importance. Nobody could guess how enormously important that business was, half so well as Garling. The ruin he had planned might be coming on already—might well have begun even now, and if it fell whilst he was in England, nothing could save him. The power would have passed from his employer's hands, and the promise he had given would not be worth a straw.

'Anybody in Number Thirteen?' asked Garling.

'No, sir,' said the clerk who had brought the message.

'Then show the messenger in there.'

Garling went to meet the Bank messenger. The tale he had to tell was brief. The account of the firm was enormously overdrawn, and cheques to a large amount, bearing the firm's signature, had been passed in—fortunately not

presented for payment. Certain promissory notes also were falling due. 'We pay in fifty thousand pounds this afternoon,' said Garling. 'Mr Lumby is in town, and had made arrangements to meet me at noon to-day for that purpose. We shall follow you at once.'

'We were surprised, sir, at the great drafts you have been making lately.'

'No doubt,' said Garling—'no doubt. Had there been any great stress, Mr Lumby would have transferred a portion of his private account. We shall follow directly.'

The messenger withdrew smilingly. There was no doubt about Lumby and Lumby. The senior partner's private account, swollen year by year for many years past, was enough to show their solidity. Still, if Garling could act so recklessly as this, there was at least room for other business men to gain a little credit for themselves. There was some comfort in thinking that Garling was not quite immaculate. For one moment, when the messenger had gone, Garling stood with a diabolic rebellion in his heart and eyes. Fate forced him to rescue the firm for his own sake, but he had well-nigh courage and hate enough to risk his own ruin and let crash the falling House. No! There were still chances in the world even for him. He walked swiftly to the door of Lumby's room and rained down blows upon its panels with his clenched hand. Mr Barnes came running into the corridor to ask what was the matter, and Garling seeing that he carried a heavy ruler, took it from him and made a very storm of noise. A voice answered from within, and the head of the firm, looking, to Mr Barnes's wild astonishment, like a drunken man, threw open the door. Garling entered the room, closed the door in his successor's face, and accosted his late employer.

'Be quick, or you will be too late. A messenger from the Bank has been here to say that the firm's account is overdrawn, with heavy demands to meet.' Crossing the room, he shot back the bolt, and threw open the sliding panel. 'Mr Barnes,' he said, cool and calm as ever, 'oblige me by sending for a hansom. At once, if you please.' The astounded Barnes once more shut out by the returning of the panel, rang the bell and transmitted Garling's order. The merchant facing Garling looked dazed and overwhelmed with sleep. 'I have everything in readiness,' said the ex-cashier. 'Come with me—there is not a minute to lose.'

Lumby looked stupidly at his watch. 'A quarter to four,' he said heavily. 'What is the matter?'

'Come with me,' repeated Garling. 'Compose yourself. If you go to the Bank with such an air as this, the town will declare you bankrupt. You look it.' He spoke with quiet scorn, not hurried by the pressure of events or swayed out of his usual possession of himself.

'I have been asleep,' said the merchant. 'What is the matter?'

'Ruin is the matter!' cried Garling, stirred at last.—Barnes in the next room heard those awful unbelievable words, and dropped into his chair white as a ghost.—'Come with me, and wake up by the way.' If they were late, Garling would not set his liberty at a pin's fee. The merchant, looking weakly round, took up his

hat with a shaking hand and began to draw on his gloves.

'Have you the drafts made out?' he asked.

'Yes,' said Garling, thrusting them upon him with both hands. 'Come!' There was a horrible impatience on him now, and a fear lest they should lose the hour. He had to stifle this hurry and dread, whilst he walked behind Lumby through the offices. The merchant's aspect awakened surmises among the clerks, and it was told afterwards how his hands shook and how pale he was. A hansom was standing already at the door, and they both entered. Garling gave his instructions to the driver; the man touched his horse with his whip, and they started.

'There is ample time,' said the merchant to himself, consulting his watch again. 'I could walk to the Bank in less than the time we have.' His face lost its flushed and excited look, and the old expression came back into his eyes. He drew himself together and crossed his arms upon his breast, holding in his right hand the documents which meant recovered fortune and an unsoiled name. As his mind began to play again, he fathomed the reason of Garling's urgency. 'A curious situation,' he said almost complacently. 'Was ever scoundrel so anxious to disgorge before?'

SNAKE-ANECDOTES.

IN TWO PARTS.—PART II.

ON one occasion, when I arrived in England, as a porter was removing my things from the ship, a custom-house officer at the dock-gates, impelled by curiosity, insisted on opening one of my boxes. There was not the slightest reason for his doing so; all my boxes had been duly examined at the baggage warehouse, the pass-ticket signed, and this particular one labelled 'Live Animals;' but he had a right to do so, and would do so, and did so, and was bitten in the hand by a snake. I was on board my ship at the time, and was sent for in hot haste. Now, I have suffered so much from meddlesome and vexatious custom-house officials, that I was not at all sorry to hear of the occurrence, and resolved that it should be a lesson to the man and a standard warning to his fellows. They all knew me in this port; they knew that I was no smuggler; but they knew, also, that I brought tropical animals home with me, for the safety of which it was of the highest importance that they should reach their destination as soon as possible. And the consequence was that the truck containing them was frequently stopped in its progress by somebody on the look-out for it, and delayed on some pretext or other until black-mail had been extorted.

When I reached the dock-gate, I found the victim lying on the ground, half supported by a policeman, and surrounded by an agitated crowd. He was pallid, and covered with a cold perspiration, speechless, faint, and almost pulseless, his lips white, and his features contracted into an expression of intense anxiety.

'For heaven's sake, give him something quick, sir,' said the policeman, 'or he'll be gone!'

'I can't help it,' I replied; 'he had no right

to open my box; and I refuse to be responsible. He must stand the consequences. I can do nothing for him!'

A cry of horror and indignation burst from the crowd; but I was obstinate. In vain they begged, prayed, entreated me to 'give him something.' If I didn't, the man would die.—I didn't care; serve him right. If I had not retreated to the ship, I believe they would have pitched me into the dock. The unhappy minion of the revenue was put into a cab more dead than alive, and taken to the hospital, where the house-surgeon carefully examined his hand, and laughed at him. He had a terrible fright; but the snake was a harmless one.

A sort of converse case to this proves how necessary it is to study these reptiles attentively before venturing on liberties with them. There are two brilliant-coloured snakes, common in South America, which resemble each other so closely that it requires some experience to distinguish them apart; even when compared together, the difference is not readily perceptible to an unpractised eye. Both are loosely known as coral snakes; but one (*Elaps lemniscatus*) is venomous, while the other (*Oxyrhopus dolatus*) is quite innocent. I had shown a specimen of the latter to a friend, who, without having 'gone in' for them scientifically, has not that horror of snakes which most people have, and he had taken it in his hands without fear, on my assuring him that its bite could do him no injury. Some time afterwards he obtained possession of an *Elaps*, which, deceived by the resemblance, he actually handled and exhibited to his acquaintances for several weeks as harmless, until I met him, and demonstrated his error by opening the serpent's mouth and showing him its fangs. Luckily for him, he had not kept the creature sufficiently warm to develop its full activity; otherwise, it would inevitably have bitten him.

I frequently make use of my tame boas and pythons, and less frequently smaller snakes, in the performance of a little amateur conjuring, of which I am rather fond, and for which they are exactly fitted. Not only does the presence of a living serpent create a sort of atmosphere of traditional magic and sorcery in itself—not only does the possibility of such a thing being hidden somewhere deter an audience from wishing to examine any piece of apparatus with too close scrutiny, but they lie concealed in such a small space, that they may be carried about much more conveniently than the rabbits, guinea-pigs, and doves commonly employed for the purpose. My two pythons, each about eight feet long, and a boa a trifle smaller, come out of a borrowed hat which would seem absurdly insufficient to hold one of them, to those unacquainted with their nature and habits; and I can go down among my audience and 'produce' more moccasin, banded, garter, whip, rat, and grass snakes than they would credit me with holding, if I were hollowed out inside for the purpose. I manage it in this way. About an hour before the performance, I put a hot plate, covered with a piece of flannel, into their cage. This they very soon find out, and get on it, though their cage is always kept warm enough; for they love any amount of heat. The surface of the plate being of such a size that it shall be small in proportion to the

snake or snakes, they coil themselves up tightly on it, to get the full benefit of the warmth; and I secure them in this position just before I want them, by quietly turning up the flannel all round and reeving a pointed bit of whalebone through it immediately above the snake's body. Thus I have it in a bag of convenient shape, and the smallest possible capacity—as it would be impossible to force it into one of ten times the size; on withdrawing the whalebone, the contained reptile, having found the restraint irksome, is ready to expand to a most astonishing extent. The large ones I generally introduce all together into a hat from the *servants* or hidden shelf, at the back of a table or chair; while the small ones are concealed, singly or in couples, under the waistcoat, and in the numerous pockets and *profondes* which go to make up a modern conjurer's dress-coat. Sometimes, when I have not sufficient time beforehand to coax them into bags, I fill the 'gold-fish globes' with them, and use the same india-rubber covers to secure them as are employed in that trick, producing them from under a cloth in precisely the same way.

In the summer of 1880 I got a nasty squeeze from a big python in the Jardin Zoologique at Antwerp, which laid me up for several days. I had observed this snake, a female, about fourteen feet long, in one of the dens, and from the white efflorescence about her lips, knew that she was suffering from caries of the jaw with ulceration of the mucous membrane, so fatal to snakes in confinement; and having pointed this out to M. Vekemann, the resident Director, I obtained his permission to make trial of an ointment which I believed I had found efficacious in the early stage of the disease among my own snakes. The four reptile dens in the lion-house at Antwerp are not so commodious as those in the London Gardens, notably in the absence of proper tanks, but are extremely 'pretty'—lots of artificial rockwork framing a large mirror at the back, which has a very natural effect; so that what the poor snakes lack in water they make up for in looking-glass. I came on the following morning, armed with my ointment; but the lady had betaken herself into a crevice of the rocks, where one could scarcely catch sight of her, much less get at her. There were other pythons in the cage, some of them nearly twenty feet long, some not more than five or six; but though they projected their heads and commenced to hiss, they did not attempt to attack; and the keeper—an intelligent man, who spoke French—said they would not come at us if we did not touch them. A little one jumped harmlessly at my leg as I stepped over him. For three days the pythoness remained in her rocky, or rather plastery retreat; but on the fourth, I caught sight of her at the very top of the cage, and at once climbed up and brought her down. The poor thing's mouth was in a worse state than I had anticipated. She came down quietly enough, and though nervous, was not spiteful, and allowed me to handle her.

Now, as ill-luck would have it, the regular keeper was absent on this particular morning, and his place was filled for the time by another from some other part of the Gardens, who spoke nothing but Flemish, of which tongue I am as

profoundly ignorant as he most certainly was of the creatures under his temporary charge. I went into the den with him, taking it for granted, of course, that he was accustomed to snakes, and gave him the box of ointment to hold until I was ready to use it. When I had brought the pythoness fairly down to the floor, I gripped her hard by the neck, which had the effect—as I intended it to have, and as it always has with snakes—of making her open her mouth. I pressed her head away from me at the same time, to prevent her catching hold of any part of my clothing, in her efforts to bite. In her fright and rage, she drew her body up across my back, and twisted her tail round and round my other arm. All that I now required of the keeper was, by teasing or pinching her here and there, or by unwinding the tail when necessary, to cause her to shift her coils constantly, and prevent her resting long enough on one spot to apply undue pressure. My face I could protect for myself with the left hand. This I concluded he understood, as a matter of course. I turned round to make a sign to him to be ready and to give me the ointment, when, judge of my dismay as I caught sight of his stolid face, with a sort of dull impartial interest on it, looking at me through the glass in front, and the door closed on the outside! He had got frightened by the noise of the other pythons, and had quietly gone out again.

I was about to make an impatient gesture, when in that same instant the serpent tightened on me so suddenly and violently that I momentarily lost consciousness. I then found myself staggering about the den, fighting for life. I expected to feel my ribs give way every moment, yet my chief fear at the time was of falling through the glass. I pushed the reptile's head away from me with all my might, lest it should cross my breast, and I can remember catching sight of myself, a mulberry-coloured figure, in the mirror. I knew, too, that I was trampling about over the other pythons, who, furious at the disturbance, were now darting about the den above and all around me in every direction; and I exerted every energy to keep my feet, for I had presence of mind enough left to know that if I went down it would be all over with me. The heat was stifling. I could bear it no longer; the cage spun madly round and round before my eyes, and everything seemed to flame and roar. I let go the head. The snake twisted sharply back over my right shoulder close to my face, but did not bite me, and slid off on to the ground. I just recollect falling against the door with outstretched hands, but nothing more until I found myself sitting on the steps outside, coughing violently, while the phlegmatic keeper was putting a hot key down my back, for some occult reason. I brought up a little blood, and drank a little brandy, after which I soon got better; but I was not well enough to walk home, and the bruise in my side did not fade for many a day. I suppose the whole affair did not last more than a few seconds, but I found it quite long enough. Fortunately, the snake had only a small part of her body across my left side and back; had she encircled me with a whole coil, I should have been crushed like an egg-shell.

Curiously enough, my left arm was quite paralysed, and I did not fully recover the use of it for a week. I did not know it at the time, but she must have pressed her tail under my armpit, and so compressed the nerves. The accident was one of the stupidest and most preventable in the world, and was entirely owing to my taking the wrong man into the cage to assist me. I may add that I went in some days later with the proper keeper, and performed the operation, not only without danger, but without the least difficulty.

That serpents may be discriminatively affectionate towards individuals, beyond the mere instinctive absence of fear, every one who has kept them must know. To those who have not, I should be happy to allow my own pets to prove their case. Can a snake have sufficient intelligence to be jealous? Jealousy is perhaps the nearest approach to a rational attribute, showing some mental process of logical inference or deduction, which animals evince. I don't press the point, but merely give the fact that Totsey, my boa, one of the gentlest and best-tempered of snakes, who lives in a cage at perfect peace with two pythons, an anaconda, a rat-snake, a wasp-snake, and several others, will invariably bite them, if I take them up when she is on my shoulder.

With regard to snake-bites, I have had some which were serious enough certainly, of which I may perhaps give an account at some future date, when I publish in detail the experiments in pursuit of which they were voluntarily received.

THE FISHERWOMAN OF HONFLEUR.

A TALE OF THE FRENCH COMMUNE.

IN FIVE CHAPTERS.—CHAP. IV.

WHEN M. le Sous-préfet entered the breakfast room early the next morning, he found his daughter and Madeleine awaiting him—the latter trembling with doubt and fear, yet kept from utter despair by the young lady's encouraging words.

'Now, Madame, tell papa everything,' said Pauline. 'Do not be afraid. Papa is kind and good, though he is sometimes severe with wicked people.'

Thus encouraged, Madeleine told everything; and the préfet was convinced that her husband was no Communist, but was the innocent victim of a vile, unprincipled person seeking to gratify his desire for vengeance. Still, he knew not how he could interfere with any good result in behalf of the unfortunate young fisherman. The court-martial was to open at seven o'clock that morning.

'In all probability,' he thought, 'the poor man is already condemned and sentenced. A few minutes would suffice for all.'

He had ordered a police sergeant to bring him a report of the results of the court-martial, the moment it was closed.

It was now past eight o'clock, and Madeleine was just finishing her story when a servant announced the arrival of the sergeant.

The préfet quitted the room, and went to the sergeant, who presented him with the report. In one hour, sixteen prisoners had been found

guilty and sentenced to death! One had been acquitted; but third in the list appeared the name of Antoine Duroc, fisherman, of Honfleur; a rabid Communist, guilty of inciting and leading a mob to attack a military guard, and of rescuing a prisoner under arrest. The condemned were all sentenced to be shot, at noonday, in a *fosse* in the rear of La Roquette, a prison near the Place Voltaire.

Antoine's generous impulse, which had led him to release from arrest a youth whom he believed to be innocent, had brought his doom upon him. He did not attempt to deny the fact; and all he could say in extenuation of his guilt was that he believed the poor lad was innocent. The young fisherman's bold, manly appearance, in marked contrast with the aspect of the miserable, ragged, dirty, and generally ill-looking prisoners who were tried at the same time, interested one or two of the younger officers of the court-martial in his favour. One of these young officers severely cross-questioned the witness Lucien Pierrot.

'Who and what are you?' he asked. 'Can you deny the fact that you are a miserable spy, gaining your livelihood by denouncing and swearing away the lives of your fellow-men?'

'I am in the pay of the government,' replied Lucien. 'I have done my employers good service.'

'Silence!' said the President of the court-martial to the officer. 'The man speaks the truth.—Such wretches, however we may despise them,' he added *sotto voce*, 'are necessary evils in such times as these.'

The favourable notice of the younger officers availed Antoine nothing. As we have already stated, he was condemned and sentenced to death; and the report of the result of the court-martial was already in the hands of the sous-préfet, whose daughter had followed him from the apartment, and now met him re-ascending the stairs.

'Papa, you have heard bad news,' she said, looking into her father's troubled face.

'It has happened as I told you it would, Pauline,' replied the préfet. 'A few hours hence he will be shot!'

'No, papa, no!' exclaimed the young girl, arresting her father's further progress. 'How can you tell that to his poor young wife? Papa, it must not—shall not be! There is yet time. You are acquainted with Monsieur le Général Beaumont, the President of the court-martial. Hasten to him, papa. Take the poor woman with you. Show Monsieur le Général the mayor's letter; let the young wife tell her own story. Meanwhile, dear papa, I will pray earnestly for your success. But go at once; lose not a moment of time.'

'I will go, Pauline,' replied the préfet, after a few moments' thought. 'I will do my best; but I have faint hope of success. Monsieur le Général is, as you say, a friend of mine, and a just man. But he is stern and uncompromising in the performance of what he believes to be his duty; and he is justly and terribly severe in his dealings with the Communists.'

'But the poor man is not a Communist, papa!' interposed Pauline.

'Perhaps not; but the General believes him to be one of those guilty, blood-stained wretches.

If the General were to learn the nature of my errand, I do not believe he would see me. Nevertheless, I will go, and will do my utmost to save the poor man.'

The préfet and his daughter re-entered the room in which Madeleine, in a dreadful state of suspense, was awaiting their return. She had feared that some ill news had arrived, and a glance at the faces of the préfet and his daughter convinced her that her fears were not groundless.

'Monsieur, you have heard bad news,' she faintly gasped. 'My husband—my beloved Antoine is'—She could not give utterance to the dread word that was on her lips.

It was necessary to acquaint her with what had occurred.

'Is convicted, and sentenced to death; but he may yet be saved,' said the préfet. 'Be calm, Madame. Do not give way to despair. Bear up bravely. Much now depends upon yourself. Have you strength and courage to accompany me immediately to Monsieur le Général Beaumont, the President of the court-martial that sat this morning?'

'Monsieur, I have strength and courage to go anywhere—to do anything to save my poor innocent husband.'

'Then come with me—come at once, just as you are. You shall plead your husband's cause with the General. Do not hope too much; but do not despair of obtaining your husband's pardon.'

The sympathies of the préfet were now fully aroused. He ordered the horses to be put to his carriage, and bade Madeleine follow him into the courtyard. As she was leaving the room, she threw her arms round Pauline's neck and embraced her. 'Mademoiselle, thou art an angel of goodness!' she murmured. 'If I succeed—and my heart tells me that the good God will grant me success—it will be to thee, under heaven, that my Antoine will owe his life. Thou wilt restore an innocent man to his wife and babe, and wilt save his judges from imbruing their hands in innocent blood.' Then she hastened after the préfet, and entered the carriage—which was already waiting in the courtyard—with him.

At the moment of the préfet's arrival with Madeleine, the General was seated at a table in his bureau which was strewn with documents. A commissioner entered the room. 'For Monsieur le Général!' he said, presenting a long folded paper.

The General glanced at the document. 'It is well. You may go. There is no answer needed,' he said to the commissioner. Then addressing his secretary, who was writing at a table near by, he said: 'The government is determined to keep us busy, Lagrange. Seventeen fresh arrests of Communists this morning,' reading from the document.

The commissioner reappeared.

'Well, sir, what now?' said the General.

'Monsieur le Sous-préfet wishes to see your Excellency.'

'Monsieur le Sous-préfet! Show him up instantly. Was there need to announce his visit?'

'Some fresh intelligence, I presume,' he went

on, addressing the secretary, as the sous-préfet, closely followed by the shrinking, trembling Madeleine, entered the office.

'I hope, Monsieur le Général, I do not intrude, in visiting you at so early an hour?' said the préfet.

'Intrude! My good friend, you are welcome at all hours!' replied the General. 'Pray, be seated. I was just saying to Lagrange, when you were announced, that the government is determined to keep us busy. Seventeen fresh arrests this morning in my department; and sixteen scoundrels, whom we tried this morning, will be sent on their long last journey to-day at noon. We make quick work of it! The emissaries of the government—call them spies, traitors, what you will—are active. They are a pack of mean, contemptible rascals, no doubt. But at such times as the present, they are a necessary evil. One Lucien Pierrot—the best bloodhound of the pack, and as base a villain, I believe, as ever drew breath—has alone denounced sixty Communists! 'Twould not be amiss, when the work is done, to send the fellow to Hades, to keep company with the wretches he has hunted to death. But he is an active, useful scoundrel withal—Ha, ha! Whom have we here!'—catching sight of Madeleine, who had crouched down behind the sous-préfet.—'A fair follower of yours, eh?—But do not tremble, little one. We are never harsh with the fair sex.'

Madeleine shuddered, and her heart sank in her bosom. It seemed to her as if she heard her husband's doom pronounced in the harsh voice of the General, who could jest while he spoke of shedding the blood even of misguided and evil-minded men.

'Monsieur le Général,' said the sous-préfet, 'this poor woman is the unhappy young wife of the Honfleur fisherman Antoine Duroc, who was among the prisoners tried by court-martial this morning and sentenced to be shot. Monsieur, there is every reason to believe that the poor man is innocent, and that he is the victim of the wretched spy, Lucien Pierrot, of whom you spoke just now'—

Instantly the bearing of the General underwent a change. 'Antoine Duroc!' he exclaimed, interrupting the préfet, in a stern tone of voice. 'Ha! I recollect the man; a fine-looking, intelligent, determined young fellow—one of those men who gain influence over the ignorant, poverty-stricken wretches who comprise the great majority of the Communists, and urge them to pillage and murder, and finally to their own destruction. I am amazed, Monsieur, to hear you, of all men, raise a voice in behalf of a condemned Communist—you, whose official position must have taught you that the greatest criminals are, as a rule, loudest in their protestations of innocence. This man Duroc, however, confessed his guilt, and even appeared to feel proud of the part he had taken in freeing a suspected man from arrest. It is such men as Duroc that are most to be feared, and who are most deserving of punishment.'

'Monsieur le Général,' replied the préfet, 'Duroc's confession—of which I have heard—goes far, in my opinion, to prove his innocence of the other charges preferred against him. The poor

fellow believed the prisoner under arrest—a mere lad—to be innocent; and actuated by the generous impulse of the moment, he set the prisoner free. The assertion that Duroc is a Communist is certainly untrue. The young man, who was never in Paris until a day or two ago, does not know the meaning of the term, and has never troubled his head with any political questions. This fact I can prove by means of a letter from Monsieur le Maire of Honfleur, who has known the honest young fisherman from his boyhood. If you, Monsieur, will read the letter I have received, and will hearken to the story of Duroc's heart-broken young wife'—

'I will read nothing—hearken to nothing, Monsieur,' interrupted the General, who had listened with angry impatience to the speech of the préfet. 'The man has been proved guilty; he is a dangerous fellow. I cannot reconsider his case. Besides, even if he has been wrongly sentenced, which I do not believe, there is no time to make further inquiry into the matter. It is now ten o'clock. At noon, two hours hence, the sentence of the court-martial will be carried out'—

A wild cry of anguish from Madeleine, who gave way to despair on hearing her husband's doom thus carelessly alluded to, interrupted the remarks of the General. She would have sunk down to the floor had not the préfet supported her in his arms. But instantly recovering from the faintness that was stealing over her, she threw herself on her knees before the stern arbiter of her husband's fate, and tearfully entreated him to listen to her story.

'Rise, rise, young woman,' said the General, though with less sternness in his voice. 'It is useless to kneel to me. I cannot hearken to such appeals. Were I to hearken to one, I must hearken to others. Besides, as I have told you, it is too late to interfere with a sentence which I believe to have been justly pronounced.' He attempted to assist the weeping young woman to her feet; but heedless of this attempt, Madeleine still kneeling, proceeded to tell the story of the cruel threats and persecutions of Lucien Pierrot; and the General, in spite of himself, was compelled to listen to the tale. She told how it happened that her husband had come to Paris only a few days after his return from a long voyage; that, having heard of the troubles in Paris, she had dreaded some evil would befall him, and had urged him to return as soon as possible; ending by declaring, in words which her earnest and passionate love made eloquent, that the simple-hearted fisherman was incapable of intentional wrong-doing.

The stern General, who listened impatiently at first, gradually became interested in the weeping wife's story, until at length he began to think that the young fisherman might after all possibly be innocent. He read the mayor's letter, which he had hitherto declined to notice, and became more evidently convinced that Madeleine had told the truth, and that her husband was the victim of Lucien Pierrot's designs.

'Rise, young woman,' he said in a gentle voice, as he assisted the weeping girl to her feet. 'I'—

There was a stir outside the office, and the next moment, a commissionaire, breathless with haste,

entered the room. 'Pardon, Monsieur le Général,' gasped the commissionaire, as he handed to the General an official-looking document. 'I bring a letter of the utmost importance from Monsieur le Docteur Veron, Médecin en Chef at the Hôpital Beaujon.'

The General opened the letter, glanced over it, and then read aloud as follows:

MONSIEUR LE GÉNÉRAL BEAUMONT—I have to acquaint your Excellency that Lucien Pierrot, the denouncer and the chief witness against the fisherman Antoine Duroc, who was tried by court-martial this morning, was assassinated by some person, whose friend he had hunted to his doom, almost immediately after he quitted the court. He lived only a few minutes; but during that interval he confessed that, actuated by a craving for revenge, he had sworn falsely against the man Duroc, whom he now declared to be innocent of all the charges preferred against him, save that of rescuing a prisoner whom he believed to be innocent. The spy—pity that the government is compelled to employ such wretches—died in great agony, entreating with his last breath that his confession should be instantly conveyed to Monsieur the President of the court-martial.

(Signed), HENRI VERON, Hôpital Beaujon.

'Thank heaven! My husband's innocence is proved!' exclaimed Madeleine, upraising her clasped hands.

'Save that he rescued from arrest a suspected criminal, Madame,' said the General. 'But I believe that your husband acted in that instance under an impulse of the moment. Yet, I know not how to act. His pardon must be granted by government, and there is no time to make the necessary application. At all events, I will take it upon myself to stay your husband's execution, and will take the necessary measures to have the pardon ratified afterwards. But I fear it is even now too late. The prison of La Roquette is far distant; it is long past ten o'clock, and at noon the sentence of the court-martial will be carried out.'

VAGRANCY AND MENDICANCY.

By the courtesy of the editor of *The Field* we are enabled to reproduce the able remarks on the above subject which appeared in his paper on the 10th of June. The article is as follows:

The Howard Association has published a useful Report [published at sixpence, by Mr S. Harris, bookseller, Bishopsgate Without, London] on the subject of vagrancy and mendicancy, evils which for years past have engaged a great deal of attention. It will perhaps be remembered that the Howard Association was founded for the express purpose of promoting the best methods of treating criminals and preventing crime, and the object of the present Report is the education of the public mind in reference to the causes and prevention of the constantly-increasing evils of vagrancy and its attendant consequences. The tolerance, we might almost say, the favour, of the

public is the original source of almost the whole of the evils which are now complained of. Some firmness is needed in rejecting the importunities of those who would persuade us they are starving. Beggars may be relieved, or, as some would say, considered, without due regard for the consequences. In some of the pastoral parishes of Northumberland, vagrancy, according to Sir Charles E. Trevelyan, has become such an intolerable nuisance, that when the labourers are away on distant farms, the women often lock themselves up, or keep loaded guns at hand, as a protection against tramps. In other parts of the country the population is less scattered and better able to protect itself; but in all parts where tramps and mendicants are 'considered,' in the sense of being tolerated and even encouraged, all other interests must suffer more or less.

The treatment of this particular class of criminals, who are invariably guilty of soliciting alms, and are generally thieves and pilferers besides, varies in different parishes, according to the particular views of the local authorities. In some districts the vagrants are received in the casual wards with a hospitality which they highly appreciate. As Earl Stanhope observed in a communication to the Howard Association, the slack-managed workhouses are crowded with casuals, but, on the contrary, very few beggars visit the strictly managed houses. At Sydenham, in the immediate neighbourhood of London, mendicants have successively flourished and multiplied, or suffered almost complete extinction, according to the treatment. Some years ago the magistracy, the police, and a committee of local residents combined for the purpose of a stringent course of treatment, and the evil was checked. Unfortunately, it has since been again fostered by a course of treatment which, wherever it may be practised, is always successful in multiplying the number of tramps and mendicants.

To a partial extent their increase in some districts has been due to agricultural depression. That they have increased in certain localities there can be no doubt. The Report of the Kent Mendicity Society shows that the number of cases of relief granted to casuals at the workhouses in that county during the past six years has gradually increased from forty-six thousand seven hundred and thirty-two to one hundred and forty-four thousand eight hundred and sixty-one per annum. But as a rule, mendicity and vagrancy are 'professions' not very much influenced by the state of the labour-market, and they are, under all ordinary circumstances, capable of suppression, or at any rate of being kept under reasonable limits. Lenient as the law may be, its stricter administration would suffice for the discouragement of paupers to an extent which only the initiated seem at present to recognise. So far as the magistrates are concerned, little, if any, additional legislation is perhaps required, though it is certainly desirable that all magistrates should enforce the law, instead of allowing it to become

a dead letter, and that boards of guardians and magistrates should act in unison.

Mr Albert Pell's Bill proposes to increase the efficiency of boards of guardians, by giving them power to detain vagrants for several days' labour in the union workhouses. They ought at any rate to be detained long enough for legal investigation, and punishment when necessary. But the genuine labourer in search of work should have the means afforded him of proving his identity by presentation of a way-ticket or other pledge of character, so that he may proceed on his way without detention. If every industrious casual had the opportunity afforded him of proving his true character, and if relief were in all cases assured, each case being then immediately investigated by the parish officer, and, if necessary, by the magistrate with a view to punishment when deserved, one of the most pressing causes of indiscriminate alms-giving by the public—the apprehension of a possibility of the destitute being starved—would be happily removed. For that reason it may be desirable that any vagrant should be at once received and at once relieved.

At the same time, it cannot be denied that the number of casuals is invariably regulated by their treatment. The law provides for each a claim to a comfortable lodging, a good bed, a bath, night-clothes, and a meal night and morning; and these comforts might be expected to encourage vagrancy. But some of them are not appreciated. In a union in a southern county, where casuals had become a considerable burden, the master of the workhouse reported that he had very much diminished the number by a rigid enforcement of 'the bath.' Parliament prescribed 'the tub' with kind intentions, probably; but in practice it is found that casuals regard this test with invariable hostility, especially in the winter. Another hint for the officials is that the morning 'task of work' prescribed by law should be made a real task. We would point out, too, that in our experience, another most effective 'test' has been applied in the form of solitude. In some districts separate cells have been provided for the vagrants, and the 'house' thus fitted up has been speedily forsaken, in favour of establishments where unrestrained companionship is permitted.

For the purpose of suppressing professional vagrancy, it is absolutely necessary that the duties of the executive should be sternly performed. But neither the law nor the executive can alone deal with the evils of mendicancy, unless they are supported by that portion of the public which is at present addicted to indiscriminate charity. Notwithstanding all the ingenious plans and suggestions of experienced officials or others who have studied the subject of vagrancy and mendicancy, it is reluctantly admitted, even by those who are most sanguine as to the effects of remedial measures, that comparatively little can be accomplished in the way of suppression until the givers of alms are better 'educated.' They have yet to recognise that they produce the evils which their misplaced charity is intended to mitigate. If their eyes were but opened thoroughly to the deceit and wickedness they foster, they would assuredly desist. The truth is that nearly all mendicity is imposition, and the so-called charity of the streets is a direct encouragement to lies and deception.

We are more overrun with vagrants in England, it is said, than any other country except Spain and Italy, and the cause must be looked for in our wealth rather than our poverty, and in that perennial fountain of benevolence which exists among the people. On this part of the subject, the Howard Report informs us that women are responsible for half the ill-directed charity complained of. One of the correspondents of the Association, an experienced member of a board of guardians, gives examples of the deceptions by which women, he says, are imposed upon by a clever and expert tramp. 'He counterfeits a cough,' says this authority; 'he has a blister upon his chest; he knows how to perform a "fit"; he has a thousand-and-one crafty shifts by which to impose upon the unwary; besides his budget of piteous tales, which would do credit to the invention of a practised novelist.' It would appear, then, that the chief difficulty attending the work of suppression is that mendicancy is fostered and supported by 'the million.' 'The money given at cottage doors,' we read in the Report, 'to habitual mendicants in a single year probably exceeds twentyfold what the working-classes contribute to real charitable and beneficent objects.' It is the poor who are most plundered; and it is a curious fact, which shows what a secure position the class in question holds in the present state of public feeling, that tender-hearted, simple-minded women whose own children are not too well fed, are least able to resist the hypocritical appeals of tramps and impostors. Magistrates and boards of guardians may put the vagrants in the stocks, cut off their tobacco, confine them in cells, and inflict a religious service upon them night and morning, which they very much detest; but they cannot institute stocks or solitary sleeping-cells for 'the million.' And, therefore, the mind of the million being uninstructed, all efforts to diminish the evils complained of must for the present prove sadly ineffective.

The Howard Association, in common with all who have closely studied the subject of vagrancy and mendicancy, anticipate the ultimate discouragement of these evils, if they cannot be altogether suppressed, in the spread of enlightenment among the public. Meanwhile, the management on the part of the executive should undoubtedly be more strict in many of the unions, so that the minimum amount of evil may be endured, even if, for the present, it cannot be completely cured. Several attempts have been made to regulate charity and render it more reasonable, especially by satisfying the public in regard to the danger of starvation. Captain Amyatt, chief constable of Dorset, is the author of a plan by which bread tickets are distributed among vagrants, and these each being exchangeable at certain shops in the district for a pound of bread, private relief is said to be discouraged. There is a 'Berkshire system' as well as a 'Dorset plan,' which also aims at feeding genuine travellers seeking for work, and relies on the police to prosecute professional vagrants. It is doubtful if either plan has been entirely successful. And even if the stringent resolutions adopted this year at the quarter-sessions, Newcastle, were carried into effect throughout the country, it may be feared that the stream of misdirected charity would continue

to flow. It is for that reason that the facts presented in the Report of the Howard Association might be very advantageously circulated by the Press.

REMINISCENCES OF A VISIT TO SIR JOHN FRANKLIN.

VERY shortly after the return of Sir John Franklin from the Lieutenant-governorship of Van Diemen's Land, or Tasmania as it is now more generally called, he sailed on his last ill-fated voyage to the Arctic seas. Only a few months previous to his retirement from his high official position, I visited Hobart-Town, on board the *Pestonjee*, an old East India Company's cruiser, which had been chartered by the government of India to convey military and naval convicts to Van Diemen's Land. It was the custom in such cases to appoint a naval surgeon to accompany the transport-ship, who had the sole command over the convicts; and also another naval officer—generally a passed-midshipman—as an assistant to the surgeon, in his governing rather than in his medical capacity. I was appointed to accompany Dr Clarke; and for the sake of the change, I accepted the appointment joyously, for it gave me liberty to do pretty much as I pleased, and released me for six months from the restraints of naval discipline.

The military convicts on board were in many respects to be pitied. They were all Englishmen; and most of them had been transported for offences which, had they been civilians, would have been punished simply by a sentence of a month or two of imprisonment. With the naval convicts it was different; they were chiefly what are termed in India 'Portuguese,' that is to say, they were descendants of the original Portuguese settlers at Goa and other parts of the Bombay coast. These Portuguese convicts, though mostly mere youths, were convicted of such crimes as mutiny, piracy, stabbing, theft, and even murder. It was necessary to keep a strict guard over them; and it needed not that one should be a disciple of Lavater, to read their characters in the gloomy, malignant expression of their otherwise handsome features. Besides these, there were several female passengers, one or two of them wives of military convicts, who, as a great favour, had been permitted, with their children, to accompany their husbands; and others who, in consequence of the good conduct of their husbands, previously transported, had been permitted to rejoin them.

All went well until two or three days previous to our arrival at Hobart-Town. The day before, there had been a heavy gale of wind; but it had subsided, though there was still a high sea running, and the ship rolled uneasily. The female passengers, with their children, however, having been necessarily confined between decks during the gale, were glad to come on deck again to breathe the fresh air; and despite the rolling of the ship, they had nearly all come up, and were clinging to the bulwarks, anxiously looking

out for the mountains of Tasmania, which it was expected would soon become visible. Among the children was a remarkably beautiful little boy of three years old, the son of a soldier in Tasmania. This little fellow was a great favourite and pet of all on board, and was fond of running about the decks and playing with the sailors. Presently the startling cry was raised: 'A child overboard!' It was the little fellow I have just alluded to, who had escaped from his mother's arms and slipped overboard. The mother fainted; the women screamed; the sailors came rushing up from below; while, in obedience to the command of the officer, the watch on deck proceeded to heave the ship to the wind.

The captain, who had been on deck throughout the continuance of the gale, had gone to his cabin, worn out with fatigue. He was awakened, however, from his sound slumber by the unusual noise, and naturally anticipating that some serious accident had occurred, he rushed on deck in his shirt sleeves, as he had lain down. 'What is the matter?' he inquired, in great alarm.

The accident was explained to him; and the distant form of the child, now appearing like a mere speck, seen from time to time on the crest of a wave, was pointed out.

'Be smart with the boat, my men!' he cried; and casting off his shoes, he sprang, without another word, over the taffrail into the water, a depth of twelve or fourteen feet, and struck out boldly in the direction in which he had seen the child. He was an admirable swimmer, and had saved the lives of sailors on three different occasions under similar circumstances. His progress was watched with breathless interest. He was frequently lost to sight in the trough of the sea; and sometimes it was thought that the child had sunk, and then it was seen again, a mere black speck on the water. Sometimes the captain himself was so long out of sight, that fears were expressed for his safety; but he reappeared, still swimming boldly on. At length he was seen to reach the child; but he was so far away, that many doubted whether he had saved it. He could be seen now remaining stationary; but none could be certain, even with the aid of a spyglass, whether he had the child with him. The general belief was that he had seen the infant sink, and feeling his strength exhausted, and perceiving the uselessness of swimming farther, was waiting for the boat to come up to him.

Meanwhile, the men in the boat were pulling with all their might, though their progress was difficult in such a heavy sea, and to us on board, it seemed painfully slow. We feared that the captain's strength would be utterly exhausted, and that he would sink ere it reached him. At length, he was seen to be dragged on board; but even now, it was impossible to discover if the child also was saved.

All was now silent enough on board. The women had ceased their cries, and their lips only moved with murmured prayers, as they watched with almost breathless anxiety the return of the boat. At length it came alongside. The captain was lying across the stern-sheets; but the child was safe, and strange to say, alive. It was soon lifted on board, and the next moment

was clasped in its mother's arms. The mother and several of the women wept for joy.

The captain had been taken on board completely exhausted. He had seized the child's clothes with his teeth, and thus kept its head out of the water; but, as he said, he felt that he was unable to swim a single stroke to meet the boat, and was compelled to await its arrival. I need not speak of the reception he met with. It is enough to say that the mother threw herself at his feet, and clasping his knees, while tears ran down her cheeks, called upon heaven to bless and reward him. The other females were scarcely less affected and grateful. The captain was assisted to his cabin and went to bed; while the child, when its wet garments were replaced by dry ones, speedily recovered its composure.

Two days afterwards we entered the harbour of Hobart-Town, and had hardly let go our anchors ere a boat was seen approaching from the shore, in which were the Lieutenant-governor and Lady Franklin, attended by their body-guard, in the light-blue colonial uniform. The customary salute was fired, and Sir John and Lady Franklin came on board. Sir John inquired respecting the convicts; while Lady Franklin—as we subsequently learned was her constant custom when female convict or emigrant ships entered the harbour—collected the women and children around her, questioned them as to their expectations and future prospects, and in the present instance promised to have the wives conveyed to their husbands with all possible despatch. She also inquired as to their conduct on board, and their means of living when they went on shore; presented those who could read with tracts, and promised to assist them to the utmost of her ability so long as they behaved themselves well—a promise which she afterwards carried into effect.

After Sir John had examined the convicts, he asked to be introduced to the government officers, and then descended with his lady to the cabin to partake of refreshments.

I was greatly struck with the contrast between Sir John Franklin and his wife. Sir John had already acquired fame as an Arctic explorer, and on this account, I, a youth of eighteen, regarded him with much greater interest than I should have done had he been merely the Lieutenant-governor of Tasmania. He was a tall, portly, florid-complexioned man, with a head slightly bald, of very commanding presence, and with a cheerful, benevolent expression of countenance.

Lady Franklin looked like a fairy by his side. She was a slight, delicate-looking woman, with gentle, interesting features, and a soft low voice. Rather below the ordinary female stature, she seemed still less standing by the side of her stalwart husband. They remained about an hour, and then left the ship, a salute being fired on their departure. I had, however, an opportunity of becoming better acquainted with them than I could possibly have become during their brief visit to the ship; for before he left the vessel, Sir John invited the naval surgeon, the captain, and myself to dine at his residence, 'the Penns,' the next day.

Sir John Franklin had heard from the surgeon all relating to Captain Pirie's gallant conduct in

saving the life of the child at the imminent risk of his own; and the woman, with many praises and blessings, had acquainted Lady Franklin with the particulars, the glad mother proudly showing the beautiful boy whom she had so nearly lost. The captain was considerably raised in the Lieutenant-governor's estimation in consequence; and as the women, when they got on shore, quickly spread the story, he became the lion of the day. The newspapers published an account of the affair; and he was an object of curiosity and admiration so long as he remained in port. It is not always that temporary celebrity is so well merited.

To return, however, to Sir John and Lady Franklin. The Penns was a pretty, park-like place, a few miles out of the town, to which the governor was fond of retiring from the bustle and ceremony of Government House. It was not very large; but the house was snug and comfortable, and the gardens and grounds well planted, and kept in excellent order.

At the appointed time, we made our appearance at the Penns as the governor's guests. A few of the members of the government, and one or two merchants from the town, were also present, and the dinner passed off as such dinners of ceremony generally do. Some of the guests, members of the government, were at daggers-drawn with each other, and in disfavour with the merchants and citizens; but Sir John and Lady Franklin did their best to set everybody at ease and make things agreeable. There was therefore no apparent dissatisfaction; though a certain restraint and coolness between some of the guests was plainly discernible.

Captain Pirie was obliged to return to his ship that night; but Dr Clarke and I were pressed to remain, and we did so, the captain receiving and accepting a second invitation, before he took his departure.

I well remember, when his colonial guests were gone, Sir John Franklin complaining of his position. 'I am out of my element here, and I know that I am not popular with the free population,' he observed to the surgeon; 'though ever since I first landed, I have exerted myself to the utmost for the benefit of the colony, and have striven to settle the differences between the people. I care not how soon I return to England; and Lady Franklin fully agrees with me in this respect. The fact is,' he went on, 'they want a stricter, sterner hand over them. Such a man as my predecessor. [Sir Arthur Head, if I mistake not.] They quarrelled with *him* too, as they do, and will, with everybody. It is one of the evils of a system in which there are two distinct and indeed antagonistic classes to deal with and to rule over—the free settlers, and the descendants of former convicts, many of whom are among the wealthiest and most influential of the people. Socially, the two classes will not unite or mingle together, though they are necessitated to do so in public. This is not to be wondered at. But it places the governor in a very unpleasant position, and will continue to do so until convicts are no longer brought here from the mother-country, and time shall have obliterated all distinctions. As I was saying, they quarrelled continuously with the late governor, but he cared nothing for their com-

plaints, and would have his own way in everything; and they really liked him the better for it. Lady Franklin,' he added with a smile, 'would have me resign the Lieutenant-governorship, and return to England to settle down for life. But that would hardly content me. I long again to be on the quarter-deck—again to push forward the explorations in the Arctic seas, which I believe it to be England's duty to carry out, unless she is prepared to see the laurels of success plucked from her, and worn by some other country.'

If these were not the exact words of Sir John Franklin, they are nearly so, and they express the tone of his conversation. He complained bitterly of the apathy that existed with regard to Arctic exploration, and more than once repeated his fears that if England did not move more energetically in the matter, the grand triumph would be achieved by America, France, or Russia. Still, he seemed to feel an assurance that he would yet have an opportunity to continue the prosecution of the object he had most at heart, through private enterprise. That both he and Lady Franklin were heartily sick of Tasmania, was apparent in all their conversation.

The naval surgeon was obliged to return to the ship the next day to send away his reports and settle other matters in connection with his duties. I, however, had literally nothing to do. My duties throughout the voyage from India had been little more than a sinecure; and Sir John Franklin, who was always remarkable for his great kindness to the young officers of his profession, invited me to remain until the ship was ready to return to India; and I on my part was nothing loath to exchange the confinement of a transport-ship for the comforts of a pleasant dwelling on shore, and the opportunity of roaming at pleasure over the country.

Sir John seemed never to be happier than when speaking of his former voyages; and he encouraged me to converse freely with him as we strolled over the grounds together or rode out into the country. He had a complete and most perfect and elaborate set of charts of the Arctic regions, so far as they had then been explored, upon which his own explorations, and those of Captains Parry and Ross, and other Arctic explorers were distinctly marked out; and it was his greatest pleasure of an evening to display these charts and point out the spots he had visited; also tracing the courses he would endeavour to pursue, if it should ever be his 'good fortune,' as he expressed himself, again to be employed in what was the great hobby of his life. There was not a point he had discovered, nor a spot that he had visited, respecting which he had not some anecdote to tell or some narrow escape to relate. And to me it was delightful to listen to these anecdotes from the lips of a man who had bravely dared and overcome the perils of which he spoke, and who had already rendered his name famous as one of the boldest and most energetic and persevering of Arctic discoverers. Besides, I confess that it was flattering to my pride to hear a post-captain and a Lieutenant-governor conversing thus freely with a young midshipman, and encouraging me to express my own opinions, and listening to them kindly and

attentively. I spent a pleasant visit at the Penns, and was sorry to return to the ship.

While we lay in port, an emigrant-ship and a female convict-ship arrived—the latter, one of the last, if not *the* last female convict-ship that left the shores of England; and Sir John and Lady Franklin visited them both immediately on their arrival. It was her ladyship's chief pleasure, and she seemed to regard it as a duty, to exert herself to the utmost for the benefit of the younger female emigrants, and also for such female convicts as had conducted themselves well during the voyage, and whose offences against the laws of their country were such as afforded hope that, removed from the temptations of vice and poverty, they might yet redeem their characters and prove useful members of society. It must be recollected that in those days, when there was a scarcity of females in the Australian colonies, young women were often transported for offences which would nowadays be punished by a few months', or even a few weeks' imprisonment.

On landing, the female convicts were taken to a government penitentiary, where suitable employment was found for them. Persons, however, in need of female servants were permitted immediately to engage such as they thought might suit them; and many young women were at once employed as housemaids, nurses, and dressmakers, those who engaged them being answerable for their good conduct, and bound at certain periods to send in a report of their behaviour to the government. Such servants of course received no wages beyond such *douceurs* as their employers thought proper to give them as a reward for good behaviour. Moreover, after a certain period—four months, I believe—female convicts whose conduct had been satisfactory were permitted to marry any respectable and well-conducted free emigrant who was willing to take them, and had first obtained permission from the governor. The husband, moreover, was held answerable for them, and compelled to report them at stated periods to the officials of the government. Such marriages were very frequent; and it was said that many good-looking young girls were picked out immediately upon their arrival by men who were in search of wives, and who kept an eye upon them until the period of their probation had elapsed and they were at liberty to marry. It was even asserted that such females often made the best of wives. What, however, appeared strange to me was that neither the employers nor the husbands of convict females were permitted to know the crime of which they had been guilty, unless the convict, whether servant or wife, confessed it to them of her own accord. A similar secrecy was maintained as to the crimes of male convicts, unless they had been unusually atrocious, when somehow or other they leaked out, the convict probably being an object of extraordinary curiosity. Years, however, have elapsed since convicts have been sent abroad, Tasmania being freed from the evil before some of the other Australian colonies.

The Lieutenant-governor came on board the vessel once more before we sailed, to bid us farewell, and to inform the captain that he had sent a statement of his generous and gallant conduct

in saving the child's life to the Royal Humane Society in England, asking that he should be rewarded with their gold medal; which testimonial he subsequently received. This was the last I saw of the kind and brave Sir John Franklin.

PATENT MEDICINES.

A CURIOUS but interesting light was thrown upon the subject of Patent Medicines in a recent discussion in the House of Commons, demanding, we think, more than the mere newspaper paragraph given to it. The early history of patent medicines shortly stated appears to be somewhat as follows: Letters-patent—that is, open letters—were granted to certain persons with the monopoly of vending given articles. Abuses, however, having arisen, Parliament intervened, restricting the monopolies to a given number of years, and demanding at the same time a definition or specification of the character of the articles. Whether the specification of these articles ultimately came to be too vague and indefinite, or the inventors themselves dispensed with the patents; or whether, during the French wars, government, from fiscal necessities, changed the system of patents, does not clearly appear; but the system of letters-patent *was* changed, and stamp duties imposed instead. The various articles specified by name in the schedule to the Act 52 George III., includes 'Foreign medicines of all kinds except drugs, and also all other pills, powders, lozenges, tinctures, potions, cordials, electuaries, plasters, unguents, salves, ointments, drops, lotions, oils, spirits, medicated herbs and waters, chemical and official preparations whatsoever, to be used or applied externally or internally as medicines or medicaments . . . made, prepared, uttered, vended, or exposed to sale by any person or persons whatsoever, wherein the person making, preparing, uttering, vending, or exposing to sale the same hath, or claims to have, any occult art or secret for making or preparing the same.' This, in other words, simply means that if any person puts up a preparation for the cure of any complaint whatever, and puts upon the label attached to the preparation the words 'Prepared only by,' the preparation becomes liable to stamp duty. The scale of stamp duty generally determines the price of such nostrums; for example, one shilling and three-halfpence, the price of the article being one shilling, and the stamp three-halfpence; or two shillings and ninepence, the stamp in this case being threepence, and the price of the medicine two shillings and sixpence.

Two evils arising out of this system of stamp duties, are at present being used as arguments for their repeal. The first of these—namely, the sanction or countenance which government is apparently made to give to such nostrums—is not a new one. Clever but unscrupulous quacks have taken advantage of the importance of the government stamp to puff their preparations under its wing in many ways and from the earliest times. It is questionable, however, if there is much in this argument.

The changes have been too frequently rung by advertisers on the importance of the stamp, as a proof of the value of their nostrums, and patent medicines are too common in the present day, for any to be deceived but the most hopelessly ignorant. The other evil is much more serious, and to place it plainly before our readers is the purport of the present article. At the time the Pharmacy Act (1868) was being framed, the makers and dealers in such medicines were, for certain reasons, exempted from the provisions of the Act.

Probably the result of this concession was not fully realised at the time; but it now requires no prescience to see how serious its consequences are. By this Pharmacy Act, very stringent restrictions are placed on the sale of poisons. No one, unless he be a medical man, can obtain any of the more potent poisons without very considerable difficulty, such as giving name and address, stating purposes for which they are required, signing his name before witnesses, &c. The less virulent poisons are also put under restrictions, such as labelling distinctly the name of the substance, with the name of the seller, and also with the word 'Poison;' the seller in both cases requiring to be on the register of chemists and druggists. All patent-medicine vendors, however, by reason of the concession above alluded to, are exempt from these restrictions. It is open to any one, even to the most ignorant, to put up and sell these powerful medicines (poisons they may be) in any quantity and of any strength, without control by government, or guarantee of any kind as to the ingredients, if they only observe the stamp duties.

It will, we think, strike most minds that the proverbial coach-and-six may be driven under such circumstances with some facility through this Act of parliament. This is the second evil, as generally stated, and we are not aware that the argument against patent medicines has ever advanced much beyond this. To those, however, who are intimately acquainted with the subject, the evil is much more serious than appears on the surface. A few accidental deaths from inadvertence or carelessness, or from want of having the nostrum properly labelled poison, is the least of the evil. If for the word 'poison,' used in the foregoing statements, 'narcotics' be substituted, and if with the use of narcotics we can associate habits formed which lead in many cases to confirmed disease, and worse still, exercise the most hurtful influence on the mental and moral constitution, we even then realise only part of the evil. To us, the worst part of all seems to lie in this, that the poor deluded takers of these nostrums may have formed the habit of using narcotics before they are aware. Under the synonym of some simple household remedy, they unconsciously have been taking solutions of the most powerful narcotics. Dr Farquharson, speaking on the subject in the discussion referred to in the House of Commons, mentions that 'one of the most dangerous compounds (of this class) was an Essence of Linseed, containing a large quantity of morphia, from the use of which painful cases of poisoning had occurred.' Each case of poisoning resulting from the use of this nostrum, however much to be deplored, is probably as nothing compared with the many cases of vicious habits

which its use may have formed. The habit of taking narcotics, as every one knows, is not difficult to acquire; and with many, the only hope of safety, as in the case of others with strong drinks, is never to taste them.

The warning thus given as to a certain class of patent medicines does not come too soon. They have been increasing to a very great extent in recent years, in fact supplanting very much the old well-known family medicines; and owing to the success of one or two comparatively innocent and even efficacious preparations, others of a baleful tendency have unfortunately become popular.

C U C K O O !

Summer is leumen in,
Lhude sing Cuckoo.

Old English Song.

THERE'S a dreamy voice in the summer air,
Its mellow music is ever rare—

Cuckoo !

Leading our thoughts like gentle seer
Over meadow and moor and mere,
Like a saddening love, the spell is dear :
Sweetly sings cuckoo.

It breathes a tale of the flowers of May,
Of violet bank and primrose brae,

Cuckoo !

Woods with the hyacinth misty blue,
Fields with the daisy white, and the dew
Bright as the day the world was new :
Blithely calls cuckoo.

Snow-white showers of anemones
Have blown beneath the budding trees—

Cuckoo !

The sombre pines to life have sprung,
And all with tender tassels hung,
Have sunlight o'er their shadows flung :
Summer sings cuckoo.

Far hath fled the winter's ruth ;
Winds breathe softly from the south :

Cuckoo !

Woodlands gladden every scene,
With their shades of tender green,
Of gold and bronze, in holt and dean :
Mellow calls cuckoo.

O'er the still and distant down,
Where the heath is black and brown—

Cuckoo !

Where the birch with drooping head,
And the stunted oaks are spread
Thinly 'twixt the moor and mead,
Gladsome calls cuckoo.

Floating o'er the braiding corn,
In the peaceful eve and morn,

Cuckoo !

As from sprite that fitteth by,
Singing sweetly in a sigh,
Weird and strange the melody :
Quaintly calls cuckoo !

A HOLIDAY CRUISE.

How few there are among weary Londoners who ever take to a short sea-voyage as a cure for overwork and brain-strain. Not to see a newspaper for a week, to forget house bills, to quit the rush and hurry of the great thoroughfares in order to breathe the purest air on our planet—is surely in itself temptation enough. And all this is to be had without weary poring over time-tables and guide-books, or the dusty rattle of long railway journeys. We have only to invest in a mackintosh, to commit ourselves to a coasting-steamer, and enjoy a four days' cruise through some of the wildest coast-scenery in the British Islands. The boats we have in our mind are no 'crank' cockles, but comport themselves well during their weekly voyages from London (Regent's Canal Dock) to Liverpool, *via* Plymouth, Falmouth, and round the west coast of England; or from Liverpool (Trafalgar Dock) to London. We shall suppose ourselves on board, say the good ship *Faithful*,* with two hours on our hands wherein to stow our luggage, study the bearings of our berth, and the geography of our steamer. Even the mysteries of loading have an interest and humour all their own.

Through the autumnal mist, the setting sun is gilding the Victoria Tower, and setting the ball and cross of St Paul's in a blaze. The tide is flowing, and the swarms of mudlarks, mere bags of bone, are being driven from their oozy playgrounds by the rising water. All is bustle. We lie under the lee of a big ship, with giant yardarms that stretch half across the basin, and rigging that seems one endless tracery of confused 'cat's-cradle.' As we work ourselves riverwards, through waters coloured with strange prismatic tints by floating oils, edging our way out with infinite tact and judgment, our steamer takes her course through flocks of barges manned by grimy

men, who throw towards us good-humoured but broad sallies of wit. The *Energy*, a floating trough black as the coal she carries, lies obstinately across our bows; while the *Empress of Shadwell*, filled with high-heaped deals, clings close to the side of the *Pretty Jane*, until the summary application of a stout rope and the steam-winch despatches the two in unseemly haste astern of us, and leaves the way clear to the dock-gates. And then, just as we are preparing to turn down the river, an aimless waif, slowly revolving as it drifts up-stream with the tide, slews round across our cut-water, and gives our patient skipper a final vexation.

Meantime, the passengers—young men and maidens, old men and (a few) children, are safe on board; and the stewardess, her eyes like those of Argus, her hands numberless apparently as those of Briareus, handles her clients with judgment. The captain from India insists on a change of berth, his present allotment being too near the propeller to suit his delicate wife. Having disposed of the captain, the stewardess sternly warns a clamant Scotchman that he must sleep in the lifeboat if he would find a resting-place at all. His name is the last on her list, and he has Hobson's choice. To the young ladies, she is more than a mother. Rugs are unrolled, and strange head-coverings produced. The detachment of London clerks on holiday ask erratic and irrelevant questions of the officers, and receive in the stir of departure but scant courtesy, not undeservedly; but the frayed and scrappy answers seem to satisfy them. And soon almost before we know we are well cast off, we have visions of brightly-lighted rooms and convivial parties in the famous Greenwich hosteleries.

The coils of rope, which lie about our deck like heaps of newly caught conger eels, are soon in apple-pie order. The winch has ceased to rattle and scream. Now and again, a ghostly steamer, with glittering eyes of red and green, glides out of the gloom ahead and vanishes astern. One great four-masted steamship passes us, waking the echoes with her fog-horn,

* The agents are J. D. Hewitt & Co., 101 Leadenhall Street, London; or Samuel Hough, 25 Water Street, Liverpool.

hoarsely and fitfully blowing like some monster Behemoth. We slide by tall barques that are being towed towards the sea by panting steam-tugs. The dark masses of canvas flap eerily as the sailors spread them, ready for the time when the tow-line is cast off and the ship spreads her wings at the Nore. And as the fragrant breeze brings the scent of the Kentish hayfields across the broadening river at Gravesend, we turn in, and sleep to the rhythmic hum of the screw, only broken by the commands of the captain on the bridge, as he threads his way through fleets of fishing-boats or coasting-schooners lying wind-bound.

It is useless to hope to lie late on board ship. Before daylight, the sailors are giving the decks their bath; and what healthier for stout limbs and good nerves than a douche of fresh salt water from the hose, if one can set the teeth and bear a sharp shock? The sun is not yet up; and the mate on the bridge, the look-out man and the swabbers, are the only witnesses of our improvised 'tub.' Strange to say, it is a new experience to them, as to us. And then we climb to the bridge, and find we are well off Ramsgate, the Dover cliffs lying like a faint cloud on our starboard bow. And what a sunrise! Surely not even the colouring of the Alps, as the sunbeams steal down the slopes and precipices, can equal the cloud-effects of a dawn at sea. Gradually the North Foreland light pales as the purple east grows violet—then pale blue—then a sudden flood of gold as the sun rises. The cloud-bank lying to the west far away over the Sussex Weald is tinged with a glowing pink, and the cliffs stand out against the misty distance, a ribbon-like streak of dazzling whiteness. The Downs are full of wind-bound ships, and the air is crisp and fresh with promise of a glowing noon.

But the stewardess is already stirring, willing and ready to dispense a welcome cup of steaming coffee—very necessary, for breakfast is more than three hours distant. And so we slip by dreary Dungeness, with its shuddering associations of wreck and disaster. Shingle stretches for miles, only dotted here and there with quaint-shaped towers and pyramids of tarred timbers, landmarks for the fishermen, whose boats are drawn up in front of the little villages, each a mere handful of squat cottages, which at intervals fringe the bay. Then Dover, the castle standing out bold and clean-cut against the sky; and Folkestone, with the white funnels of the mail-boats topping the pier. And then from Beachy Head, with its cruel fringe of reefs, and the caves, dug by some philanthropist in the past for shipwrecked sailors, showing like portholes in the cliffs' white sides, we stand boldly across for the Isle of Wight. So the first act in our little play closes, and we go below, eager for the hospitable fare provided in plenty in the saloon.

Quaint enough are the experiences of the passengers. One had severely 'boomed' his head, he told us, in climbing to his berth. Two bright young girls travelling northward by sea for the sake of their father's health, were grieving because their store of novels had been left behind. Another, a San Franciscan, having engaged a berth in next week's 'White Star,' has made a little business at Falmouth the excuse for a passing glimpse of the coast-

scenery of the old country. We warn him that it may not perhaps beat the Hudson, but it is better and healthier travelling than even his favourite Pullman. On the whole, we are a sufficiently jolly family.

The Sunday afternoon finds us running by the Undercliff, close to the Ventnor promenade, whence on a famous other Sunday, a few years ago, the last was seen of the hapless *Eurydice*. Even now, under the white lighthouse on St Catherine's Point, we can see the sailor-folk gathering up the timber of a wreck, the gaunt ribs of which stand up from the breakers. A snub-nosed but stately man-of-war passes close, her yardarms mathematically squared, and her cream-coloured funnel leaving only a genteel streak of smoke astern. She wears a bold, look-the-world-in-the-face air, as she steams by within a bare hundred yards of our more humble craft. My lordly friend, we could give you three knots an hour and beat you 'hands down,' for all your princely pride, and iron plates, and trim blue-jackets, and bright brass fittings, and twin screws.

Our captain is no fair-weather sailor, as our experiences showed, but holds a pilot's certificate for all the great ports in the kingdom. He is watching the weather rather anxiously, though. The sun is sinking in a watery sky; the 'mare's-tail' clouds are streaming from the horizon to the zenith, and the glass is falling fast. The young ladies have not missed their novels much; but they do not look quite so much at home as in the early morning, and wear a preoccupied look. In fact, it is rougher than early in the day. The Anglo-Indian's wife retires to her berth prematurely soon. We who are good sailors, only turn in when we have sighted the Eddystone, and are within a few hours of Plymouth. Here we have time for a bathe and a stroll on the Hoe, and a few purchases from an early newsvendor.

As we sail round Mount Edgecombe, and stand out for Falmouth, the wind is rising, and the spindrift is already beginning to fly. Squally rain-gusts fleet by us up Channel, and mackintosh-costume is the order of the day. But the pipe of our cheery skipper is not quenched nor his general force abated, and he tells us how, a fortnight ago, all at short notice, the princess of the Lyceum came on board and asked for a passage. There was no denying Portia. But the steamer was full; and in despair he stowed the great actress's many trunks; and for want of a spare berth, gave up to her his own snug chart-house and sanctum on the bridge, the shrine of his household gods, and went bedless himself; and she had been made so much at home, that she had regretted when her short voyage was over, and had gone back to hard work with fresh stores of energy and a new bloom on her cheek.

An hour or two at picturesque Falmouth, where we ship a lifeboat for the North, and we steam away for two eventful days before we touch land again. Out in mid-channel we can see the Wolf lighthouse standing on the grim rock which has moaned and roared from its mysterious cavern the knell of so many homeward-bound ships sunk in the deep waters that surround it on every side. What treasure-trove these 'roaring wells' of this Cornish Scylla must contain! And then we pass the 'Runnel' stone, marked by a tolling

bell, that dips and springs in its cradle-belfry, sending a shiver through us as we think how that doleful sound right ahead would strike the heart of a sea-captain straining his eyes through a dense sea-fog or a driving snow-storm in December, to catch a glimpse of the electric light on the Lizard. And now the night begins to fall, with a gale rising.

Though our voyage has been exceptionally rough, the romance of the weather is well worth the study. We are close in to the haggard spine of rocks which are the extremity of England. The white lighthouse is drenched every other minute in columns of spray. The man that is cleaning the glass is discernible as he holds on to the light rail, the collar of the tower. These poor fellows have three months' provisions in store; for though the keepers of lighthouses are supposed to be changed once a month, the Trinity relieving yacht is unable, as often as not, to land the fresh watchmen, and steams by, leaving the three for another spell of Atlantic buffeting. On the black peaked reefs of rocks, the white gulls are in full conclave to-night; and the 'Shark's Fin,' cruellest reef of the group, usually a black band in the blue waters, is merely a hundred yards of churned creamy surf. The storm-fiends seem to be holding a Walpurgis night; and the thought just strikes one, Suppose our machinery were to break down! In the distance, we can see the gleam of the Longships lightship, whose hardy crew are wont to complain of the ceaseless fierceness of the weather and the unrelenting roar of the storm-winds. But our steamer rides the waves like a duck.

It is a sensation that will last a lifetime to watch the night through with the look-out man in the bows, and see the moon break through the flying clouds, and stretch a long band of glittering light across the hurrying waves. The streaming smoke from our funnel stands out against the moonlight; while we drive on indifferent to the blows of the waves, the lashing water falling on our deck, and the howling 'ugly' night. As the bows dip, the screw plays with a buzz. Our sailor-companion warns us that a squall is coming. And in a moment his words are verified. For five minutes the cordage sings and strains, and a few drops of stinging rain whistle by and in our faces. And then as suddenly the moonlight is bright again, and shows us the whole length of the pitching steamer. Soon after, we see the Cunard steamer, bound for Havre and the Mediterranean, pass us and cross the moon-track, her lines as elegant as those of a racing yacht. And thereafter we think we have had enough of wind and weather, and turn in to sleep sound. When we wake, we find ourselves within sight of the Welsh mountains, and Bardsey Island ahead; and in the far distance, the least faint glimpse of the hills of Wexford.

As we cross the mouth of Cardigan Bay, we can see the slopes of tourist-trod Snowdon, and the saddle of the 'Rivals,' grandest of ranges, as yet undesecrated by the autumnal alpenstock. Barren and dreary enough seem the moors of the Welsh coast after the Sussex weald; uninviting and inhospitable. The wind is north-west, and the American steamers are hugging the Irish coast for smoother water's sake. The Isle of Man is seen far away to westward towards the sunset.

As we round the Skerries and signal our number, the granite headland of Holyhead provokes enthusiasm even in the stolid breast of the now convalescent Anglo-Indian. We pass through the 'race' of treacherous choppy water off the harbour, and by the 'Mouse' rock, familiar to voyagers Dublinwards. As we cross the bar of the Mersey, an Inman steamer passes close, with picturesque dots of electric light streaming from her saloon; and in her wake a fleet of lesser steamers sailing at high water; destined to scatter to the four points of the compass after a few hours' companionship.

But the romance is over. Bidston light is mere prose after the poetry of the Longships. The fragrant sea-air has given place to the odours of the great estuary; and as our whistle sounds, the captain clears the bridge with infinite patience, warps us alongside the dock; and the varied memories of our four days' cruise fade as we wish our friends good-night, and go our several ways.

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

CHAPTER XXIX.—'I AM AFRAID, SIR, IT IS TALKED ABOUT.'

CHEAPSIDE was unusually crowded that afternoon, and both men being eager to get on, the impediments to traffic exaggerated themselves, and became irritating. Garling lifted the little trap in the roof of the cab and snarled at the driver. 'Drive!' The driver being also irritated by the obstacles he met, snarled back at him, and picking his way among cabs, omnibuses, and wagons, cast loose anathemas right and left as boys throw crackers. In a little time they got behind an omnibus, and the driver being compelled to adapt his speed to that of the vehicle before him, broke in a wordy hailstorm on the conductor, who, turning upon him a smiling visage, winked slowly and laboriously, and condescended no other answer. The cabman, naturally incensed, slanged him with all the eloquence of wrath. The omnibus stopped to pick up a stout old lady; and the conductor taking advantage of the pause, addressed the driver of the hansom with smooth satire: 'You shouldn't want to take the bread out of poor folks' mouths, your R'yal Highness. Get down, and let the cabman drive. He's used to it.'

Garling looked up at the sound of the voice, and saw Hiram Search. Hiram, beaming all over with the consciousness of his own humour, caught Garling's eye at that moment, and raised his hat to him with a genial flourish. Lumby sat back in the cab with his arms across his breast, trying to be calm, but relapsing into his old flurried condition—anxious to be in time. The bus got into motion again, and the cab followed, slowly, the cabman swearing as terribly as, according to Captain Shandy, our army did in Flanders. Hiram, with much apparent interest, demanded to know where he preached on Sundays; and winked at Garling, as if to ask him what he thought of *that*, in the way of genteel repartee. There was almost nothing but the horse's length between Garling and the destroyer of his plans, and to see him there thus insolently gleeful and familiar, was more than

gall and wormwood. The 'bus being pulled up very suddenly, the cab-horse's nose almost entered at the window. 'Going to Whitechapel?' asked Hiram of the driver sweetly. 'Don't keep us waiting. Get in, sir, get in. We'll take care of you.' Having delivered himself of this sally, he winked again at Garling, who was by this time half mad with rage, and only held himself in by a supreme effort.

'Hiram!' cried a faint pleading voice from the pavement, and a hand touched the conductor's arm as he swung by his strap, inspecting the crowd with a knowing eye, as if he were choosing prize passengers. He turned, and there was Mary, looking pale and frightened, and bearing on her face the mark of recent tears. Hiram rang his bell to stop the omnibus, and leaped to the pavement. Garling saw the little figure also, and maddened, feeling that his dead wife's vengeance was indeed beginning, in spite of her forgiveness. But a second later, or less, the sight of the little satchel Mary carried in her hand banished all other things from his mind. He had until that moment forgotten it as completely as though it had been of no value. The shock of detection, the struggle for self-mastery, the shame and rage which had crowded on him since he had felt his employer's arresting and accusing hand, had left no room for the thought of minor troubles.

'What is it?' cried Hiram, bending over the worn face. 'What is it?'

'He has left me!' she answered. 'The house is locked.' Her lips were trembling; and he, forgetting where he stood, took both her hands in his, and felt them cold. 'I don't know where to go. He said we were going to Southampton, and put me in the train, and left me.'

'Left you!' cried Hiram. 'Why, there he is!'

'Where?' she asked, shrinking to him as if from some imagined fear.

At that moment Garling's hand was laid upon the satchel. 'Give this to me!' he said hoarsely. 'Go home—go home!' She held tightly to the bag; but he wrenched it from her hand, and returned to the cab. 'Drive on!' he cried with a terrible execration, standing behind the splash-board and facing the driver. The cabman shook his head up and down with a countenance in which mute appeal against the unreasonableness of this direction was blent with scorn and pity.

'What is all this?' asked Lumby, as Garling threw himself into the seat again.

'What is it?' mocked Garling, gnashing at him. 'Ask what it was to-morrow.'

Lumby looked at him with scornful wonder, not unmixed with fear. 'We shall be late,' he said. 'Had we not better walk?'

They left the cab together; and Garling snarled to the driver to go to the offices for payment, and strove, whilst Lumby held his arm, to struggle through the crowd. But the crowd had on a sudden grown dense. There was a dead-lock in the horseway, and on the footpath the people were crushed together looking at it. The beginning of anger, as the wise man said, is like the letting in of waters, and Garling was now fairly raging. Having once begun to surrender his self-control, he became for the moment helpless to control himself at all, and struggled like a madman. At last they reached the limits of

the crowd, and found a straight course before them; when suddenly, loud and clear clanged out the clock of Bow Church, striking the hour. At that they turned pale faces on each other, and Lumby released Garling's arm. The great bell of Paul's followed, booming above the roar of the street and the general babel of sound only for the ears that waited for it. And in both minds the same imagined sight was present; each saw the image of a closing bank door.

'It will be known before nightfall,' panted Lumby, fixing his haggard eyes on Garling in wild accusation.

'Why should it?' he responded. 'You have everything in hand, and it will be a passing stroke at the worst. Be at the Bank by ten o'clock in the morning.'

The merchant turned, thrusting the drafts into his breast-pocket, and walked back, with bent head, despondent face, and heavy heart; and his mechanical steps led him to the offices. It was not a difficult thing for Garling to hang behind and lose his late employer for a moment in the crowd. He was absent from the merchant's thoughts, and that made the task still easier. And having lost him for a moment, it was the easiest thing in the world to slip into a hansom cab outside the block and drive away. Ample need to drive away, as matters stood. For a whisper once started in the City, would swell ere long into a roar, and in that roar he could already hear in fancy his own name. He would be gone before the storm could burst. The House would weather it easily enough, and within his grinding teeth he bann'd the House. But his own crime would be known, and his defeat. There was the sting he dreaded. Before that, he was a coward. He could have borne to be spoken of as a successful scoundrel; but to be pointed at as a detected rogue, compelled to resign his booty, and then scornfully dismissed, would have been unendurable, *was* unendurable to think of, and had yet to be endured.

There was whispering and putting of heads together in the offices of Lumby and Lumby. Barnes sat in Garling's seat, and there was a look of amazed misery upon his face which struck all who saw him there. The head of the firm had been locked in his own room all day; and after the coming of the Bank messenger, he had gone out tremulous and fevered, and had returned as if from a fruitless errand, hanging his head, and looking like a ghost. Garling, even the impenetrable Garling, had looked worn and gray. There was a vague suspicion as to what these portents might mean, which filled the very air, and made the whisperings needless to carry it from mind to mind. And, to set on all surmise the seal of dreadful certainty, it was known somehow before five o'clock by everybody in the place, down to the very messengers, that just before the closing of the Bank a cheque had been presented and returned with the statement that there were no effects to meet it. The flying Garling might well have foreseen this last disaster. But not everybody in the place knew of this open shame to the old craft which had weathered so many storms and sailed triumphantly through so much evil weather since it was launched one hundred and thirty years ago. Not the master of the ship. No man

told him as yet of that disaster. He sat alone, separated from the grieving, faithful Barnes, only by the sliding panel of corrugated glass. The time for departure had gone by; but Barnes waited, fain to offer consolation, if he had but dared, or known how to offer it. At length he went round by the corridor and tapped humbly at the door. 'Come in,' cried the merchant in a dejected voice, and Barnes entered.

'What are your instructions for to-morrow, sir?' asked Barnes.

'You will hold the same place,' returned his employer, looking up at him with a withered smile. 'You may consider yourself promoted permanently.—Where is Garling?' he asked suddenly, rising with a startled air.

'Mr Garling has not returned,' answered Barnes, 'since you and he went out an hour ago.'

'Not returned!' said Lumby, taking one quick step forward and halting suddenly. 'No matter.—Mr Barnes!'

'Yes, sir.'

'We will go through matters to-morrow, and I shall have to place some confidences in you, which I shall rely upon you to respect.'

Barnes's heart ached. Was it possible Lumby did not know that the expected crash was the town's talk already?

'We have passed through a grave crisis, which has left almost everything disarranged, and there will be work to do for weeks to come. We will talk of these things to-morrow. I have had a time of great anxiety, and I am tired.'

Barnes's face brightened, and he said eagerly: 'You will be able to put things straight again, sir?'

The merchant looked at him wonderingly. 'What do *you* know about this matter, Mr Barnes?' There was no one to hear their talk, but by instinct he closed the door.

'The cheque presented at the Bank last thing this afternoon, sir. It is talked about already. I am told that Rawlings & Co., relying on the name of the firm, got it cashed privately after it was refused by the Bank. They were always very questionable people, sir, Rawlings & Co.'

'The cheque?' said the merchant, 'refused this afternoon? Why, what is this?'

'Is it possible that you don't know, sir?' cried Barnes. 'Rawlings was paid by cheque yesterday—two, five, five, odd. The cheque was presented this afternoon, and the Bank returned it, marked "No effects." I am afraid, sir, it is talked about.'

Lumby strode up and down the room, deeply moved by this discovery. 'This is bad news, Barnes,' he said, 'bad news. I had hoped to escape anything of that sort. But it will be all right to-morrow. Be here at the usual time in the morning. If you hear any rumour against the solidity of the firm, I authorise you to offer it the fullest and roundest denial. Do you hear?—the fullest and roundest denial. You shall know all to-morrow. I am too fatigued to attend to business now.—Good-night.'

'Good-night, sir,' returned Barnes, and went his way, lifted up in spirit, but still puzzled. 'If he heard any rumour'—so ran the merchant's words. Rumour? There was no rumour, but a downright clamant roar, and wherever Barnes went, he heard it. Wherever he heard it, he denied it; as a matter of personal knowledge, he

denied it; being personally in the full confidence of the firm, he assured assailants right and left that there was nothing in it. And as when wind and tide go contrary ways there is a greater tumult than when both go together, this authoritative contradiction made the roar the louder, and spread it wider.

Lumby, left alone, raised his face towards the skylight in a sort of passionate exultation and triumph for a moment, and drooped it again in anguish. The House was saved; heaven had been merciful, villainy had been discomfited, and the House was saved; but the good old name was soiled. The British merchant found a doubt upon his name as intolerable as the ermine finds a spot upon its fur. Never a breath upon the name until to-day, and now it was soiled—soiled! How could the return of a cheque from such a House fail to be talked of? That awful cord began to tighten and loosen in his brain again, and his eyes grew hot and his hands clammy. He entered the cashier's room, intending to place the drafts in the safe, and then go home to his hotel and send for a physician. But having opened the safe, the confession Garling had written lay before him, and he must needs take it up and look at the rogue's balance-sheet at the end. From it he referred to the drafts, to see if between them they made up the sum set down there. Next, after standing for a while irresolute, he drew the gigantic ledger from its place, and laying it on the table, turned to the leaf on which he had first fixed the fraud, and compared the pencilled marks he had made upon the margin with Garling's first entry. The two exactly tallied. He stooped above the book a moment, holding the drafts and the confession in his hands, then dropped them on the broad ruled leaves, and knitting his fingers, pressed both palms above his forehead, and took a step or two across the room and back again. There was a hunted feeling in his mind, a hurry and confusion, a dim sense that any moment might bring shipwreck, that there were things to do, which being done, would avert all chance of mischief; but like a man in a nightmare, he could only grope in thought, and everything was blind and dark. What was the fear that threatened him? Where was the way of safety? If this hideous pain would only let him think a while! He reeled a little, and stretching out his hands, caught one side of the great ledger and steadied himself by it. The cord in his head was growing tenser, and the fear that followed him drew nearer. Tenser grew the cord, tenser, tenser, until at last it snapped, and the merchant, with one blind stagger sideways, closed the ledger with unconscious hands and fell huddled on the floor.

(To be continued.)

THE HERRING.

In a country like ours, the importance of the sea-fisheries can scarcely be over-estimated. Mr De Caux, in his history of the *Herring and the Herring-fishery* (London: Hamilton, Adams, & Co.), appeals to a wide public, and brings before the notice of the reader very many interesting and novel facts, which his long experience as a fish-salesman at Yarmouth has enabled him to collect and verify.

Our fisheries employ upon an average on sea and shore upwards of two hundred and ten thousand persons, who being principally heads of families, represent a population of more than three times that amount. These man a fishing-fleet of thirty thousand vessels, the greater part of which consists of herring-boats. This fleet is of two hundred and eighty thousand tons burden; and the capital employed in its outfit would suffice to farm six million acres of land, or one-sixth of the land at present under cultivation in Great Britain, calculating the necessary outlay for that at ten pounds an acre. Mr De Caux arrives at this conclusion from the consideration that land is indestructible, and that the improvements upon it are to a certain extent permanent; while fishing boats and gear depreciate so rapidly, that all fishing-property actually employed at sea has virtually to be replaced every eight or nine years. Every operation connected with fishing, whether it be boat building or repairing, or the making and mending of fishing-tackle, requires skilled and intelligent labour; even such an apparently simple operation as counting the herrings landed at the fish-wharf at Great Yarmouth in the course of one season, costing upwards of two thousand two hundred pounds.

Comparatively little is known of the habits of sea-fishes. Some naturalists have divided them into three classes—'those which invariably live at the bottom of the sea; those which invariably live in mid-water; and those which invariably live at or near the surface.' This classification, Mr De Caux considers very misleading; and is so far from being the fact, that herring and mackerel, which are classed as surface-swimmers, are often caught in trawl-nets which drag the bottom. As a rule, fishes have keen sight, but only possess the sense of hearing in a very limited degree. All fish are carnivorous; the large prey upon the small; and both large and small feed upon the different species of medusæ that at certain seasons swarm in incalculable myriads in the sea.

The herring is the most important of all the fish that swim in our seas. It abounds through an ocean area stretching from France to the North Cape, and in the North Atlantic Ocean between forty and seventy degrees of latitude. It is a rare fish on the southern coast of Greenland, and on the northern coast only a small variety is found. The old idea that the Polar Sea was the chosen home of the herring, and that it resorted to our shores only for the sake of spawning, is now entirely exploded; but of its habits little is as yet accurately known. It is gregarious, as most fishes are, and swims in shoals; and even among those which swim around our shores, there are many varieties, the Loch Fyne herring being quite different from the small black-nosed species caught off the coast of Norfolk, and these again varying considerably from the herring caught off Kimblington or Cromer Knowl. Their movements, as Mr De Caux, with much appearance of truth, conjectures, depend altogether upon the temperature of the water and the supply of food.

The spawning of herrings has long been a vexed question with naturalists, and in spite of many theories confidently advanced, it is so still. Mr De Caux, from long and careful observation,

has been led to conclude, among other things, that herrings spawn much oftener than once a year; and that when they leave the deep water and come inshore, as they undoubtedly do in the late summer and early autumn months, it is not for the purpose of spawning, but in pursuit of the multitudes of medusæ of different kinds that then appear along our coasts. 'In my opinion,' he says, 'herrings spawn wherever they may happen to be at the time they are ripe, whether they be in deep water; over a sandbank, or near to the shore.' The general idea that herring-spawn is invariably deposited at the bottom of the sea, is erroneous, for much of it floats at the surface of the water, and is vivified there. When engaged in catching herrings that were ripe for spawning, fishermen have sometimes observed the sea to have a milky appearance; and on drawing buckets filled with this water on board, they have found it to be not only full of spawn, but of live herring-fry newly hatched. This fact shows that on some occasions at least the herring-spawn vivifies and develops near the surface of the water.

That herrings spawn at least twice a year, is certain; and our author is inclined to believe that they spawn all the year round, 'and that with the exception of short intervals to recuperate their physical powers, they are always either secreting spawn or spawning.' The period of time which elapses between the spawning and the hatching of the fry, is various; Mr De Caux sets it down as usually from three to four weeks, though something depends upon the time of year and the temperature of the water. Extreme cold retards the process, and moderate heat facilitates it. Sprats, he considers not as small herrings, but as an entirely distinct species; and instead of giving the herring seven years to arrive at maturity, as some writers have done, he thinks that it is full grown within the twelvemonth. The largest herrings are taken off the coast of Labrador. Those caught on our eastern coasts rarely exceed ten or eleven inches in length; and Mr De Caux, in the millions of herring that have passed under his observation, never saw one longer than fifteen and a half inches.

Our herring-fishery is believed to have originated on the east coast, somewhere near the place where Great Yarmouth now stands. Such a fishery was already an institution in the time of the Romans, who considered the herrings caught off this coast a dainty dish. About the beginning of the Christian era, the sandbank on which Great Yarmouth now stands first began to appear above the surface of the waves, and gradually became a favourite resort of fishermen, particularly during the latter part of the Roman occupation, as the Roman garrison at the mouth of the Yare afforded them protection from pirates. The advent of the Saxons gave a fresh impetus to the herring-fishery; and early in the sixth century the Saxons built a stronghold on the sandbank, and thus laid the foundations of a herring emporium, which has continued to flourish ever since.

In 1755, the Yarmouth and Lowestoft fish-curers were threatened with serious competition in their own peculiar trade of curing red herrings, by the Scotch and Manx. Large smoke-houses were established for the purpose in Scotland

and the Isle of Man; but after a short trial, it was found necessary to disuse them, the quality of the herring caught being too inferior for smoking purposes. In 1794 great quantities of herrings were caught in the Forth, and a new epoch in the trade was inaugurated. Instead of being cured upon the spot, the fresh herrings were packed in ice and sent to London in boxes by fast-sailing vessels. The use of ice as a preservative for fish in a fresh state, had been discovered a few years before, in 1780, by a Scotchman named Dempster, who preserved salmon in this way.

During the present century, especially after the railway system came into active operation, herring-fisheries have developed largely, and are in a very prosperous state all along the coasts of the northern seas and in the northern parts of America. No nation has, however, made such progress in this particular branch of industry as the Scotch; the ancient mantle of Great Yarmouth has fallen upon them, and they are now by far the greatest herring-fishers in the world. 'They possess the enormous number of fourteen thousand five hundred herring-boats, which are manned by some fifty thousand men and boys; and the season of 1880 was the heaviest they have ever known.' The season of 1881 will long be remembered by the fishermen off the east coast of Scotland, for then occurred what was perhaps the most violent and fatal storm ever known, and not a fishing-village in the district affected but was more or less desolated by its ravages.

The herring-fishery partakes somewhat of the nature of a lottery—one boat may have a great haul; and another at no great distance from it, equally well found and well manned, may catch so few as barely to pay her expenses. In 1857, a boat belonging to Yarmouth, with ninety-one nets, caught so many herring, that it was impossible for her to carry them; and after filling the boat, the rest were thrown into the sea. In 1880, a French fisherman caught four hundred and twenty barrels; and in the early part of August 1881, a French fishing-boat, the *Gabrielle*, after taking on board as many as she could carry, had still such a multitude of fish left in the nets, that her crew were obliged to shake the remainder into the sea.

In 1835, a fish-curer of the name of Bishop discovered by chance the way to make Yarmouth bloaters. One night, after his workpeople had left, he came upon a small quantity of prime herring that had been overlooked. Unwilling to lose them, he sprinkled a little salt over them, spitted them, and hung them up all night in a smoke-house in which an oak-billet was burning. Next morning, he awoke to find himself famous in the annals of the herring-trade, as the happy possessor of the first Yarmouth bloaters, the cure of which he henceforth made his special pursuit. In the same accidental way, Newcastle kippers were discovered in 1843 by Mr John Woodger of Newcastle.

The period when herring-nets were invented is not known; but the square mesh used for them is much the same in all countries. Formerly, they were made by the hand, of hemp; but now they are made by machinery, and invariably of cotton, which is found to be more suitable. The inventor of the herring-net loom was a

Scotch working-man named James Paterson, who was born at Musselburgh towards the close of the last century. His greatest difficulty in perfecting his machine was the formation of a knot that would not slip. He never could succeed in making one similar to that made by the hand, although he made one firm enough for his purpose; but what baffled him all his life, was subsequently discovered by Walter Ritchie, a working plasterer in Leith, and the machine-made knots now exactly resemble those made by the hand. Musselburgh is now the centre of a large trade in nets, the factory of Messrs J. & W. Stuart being one of the best known in the country.

The future of our sea-fisheries is of course an object of the greatest interest to the nation at large; and it is of vital importance to avoid the needless destruction of fry and small fish, lest in this case, as in others, 'wilful waste should lead to woful want.' To insure this desirable end, Mr De Caux is of opinion that nets of a wider mesh than those presently in use should be made compulsory, so that only large herring be captured. He also thinks that shell-fish should be protected, especially mussels, as the demand for these molluscs greatly exceeds the supply. They are used for bait, and one Scotch fishing-port alone requires five million annually. The foreshores around our island are admirably calculated for mussel-farms, and should be utilised in this manner as soon as possible. Our thrifty neighbours in France have long been alive to the advantage of this, and one mussel-farm at Aiguillon, which has been systematically cultivated since the thirteenth century, yields at present a yearly revenue of fifty thousand pounds.

THE FISHERWOMAN OF HONFLEUR.

A TALE OF THE FRENCH COMMUNE.

IN FIVE CHAPTERS.—CONCLUSION.

'O MONSIEUR, in mercy's sake, delay not an instant!' cried Madeleine.

The General drew forth a printed document, at the head of which the word 'Pardon' was conspicuous in huge letters. He inserted the name of Antoine Duroc, and hastily signed his own name to the parchment. 'I have taken a great deal upon myself, young woman,' he said, as he handed the document to Madeleine. 'But hasten with this pardon to the prison. Lose no time, or you will arrive too late. If, on your arrival, the prisoners have been removed, hasten to present the pardon to the officer in command of the firing-party— Yet stay—you know not the way about Paris.'

'My carriage is in waiting, Monsieur le Général,' said the préfet. 'My coachman will drive the young woman to the prison. I will accompany her thither.'

'It is unnecessary, Monsieur le Sous-préfet,' said the General. 'A commissaire from this bureau shall accompany her. He will know how to proceed.'

A commissaire was called, and instructed to present the pardon of Antoine Duroc to the chief jailer of La Roquette, or to the officer in command of the firing-party. But Madeleine insisted upon being herself the bearer of her

husband's pardon, and received the document from the commissioner. Then, bewildered between excess of joy, mingled with doubt and fear lest she should arrive too late, she followed the commissioner without waiting to express her thanks to the General.

The sous-préfet assisted her into the carriage, and wished her success; and then bade his coachman drive with all possible speed to La Roquette.

At length the prison of La Roquette was reached. The commissioner alighted from the vehicle, and ringing the large bell, demanded to see the chief jailer. But on stating his errand, he was informed that the condemned prisoners had already been marched to the place of execution. 'But there is yet time,' added the jailer. They have but just left. It is now half-past eleven o'clock. You have half an hour to spare, and the *fosse* is not far distant. But Madame must alight from the carriage and walk. The road is impassable to vehicles of any description.'

On hearing these words, Madeleine sprang from the carriage, and conducted by the commissioner, hurried breathlessly on. 'You know the shortest road, Monsieur Commissaire,' she said. 'For heaven's sake, hasten on!'

The commissioner nodded assent. But he was a comparative stranger to that part of the city, and he soon missed his way. Leaving Madeleine, in a fever of dread and impatience, he went into a shop to inquire the way to the Place Voltaire. To the anxious girl he appeared to be so long absent, that she hastened after him. She found the shop after two or three inquiries; but when she reached it, the commissioner had quitted it to return to her, and had missed her. The streets were thronged with people. Madeleine, almost crazed with dread, passed amongst them, inquiring her way of one and then of another; but the directions she received only served further to bewilder her, and she wandered further and further astray. A church clock near by chimed the quarters. Madeleine listened breathlessly. 'Three-quarters!' she cried in a paroxysm of fear; 'only a quarter of an hour to spare! I shall be too late!'

She had turned into a by-street, which was almost deserted. Two working-men, carrying the tools necessary to their trade, were approaching her. They were the only individuals in the narrow street. As they drew near, she entreated them to guide her to the *fosse* where the prisoners were to be executed. Her quaint garb was calculated to attract attention in Paris, and the men supposed her to be a country girl who had come to the city on a holiday visit.

'What wouldst thou do at the *fosse*?' asked one of the men. 'Is it a pleasure to thee to see poor, miserable, starving wretches shot down like dogs, because they demand a share of the wealth and food that of right belongs alike to all?' The man was hurrying on in disgust, when his companion remarked Madeleine's wild and distracted look.

'Perchance, Adolphe,' said he, 'the poor girl has reason to ask the way to the *fosse*. Maybe some friend or lover is doomed to be shot at noon. She looks as if she were crazed with grief.'

'Nay, then.—Is it so, young woman? Dost

wish to see the last of some unfortunate friend or relation? Whence comest thou?' asked the man Adolphe.

'I am a fisherwoman of Honfleur, Messieurs,' replied Madeleine. 'My husband has been falsely accused, and unjustly condemned to die. I bear his pardon, and have lost my way. I fear that I shall arrive too late! As you may some day crave for mercy, Messieurs, take pity upon me, and guide me to the spot. See, here is my husband's pardon;' and she drew forth the precious document from her bosom and held it before the two men.

'Poor woman! Thou art coming away from the Place Voltaire, where the *fosse* is situated,' said the man who had spoken last. 'Thou hast little time indeed to spare. But come with us; we will guide thee thither.' The men turned and quickened their steps, and Madeleine breathlessly followed them.

Meanwhile, the commissioner, on leaving the shop, could see nothing of the young woman whom he had told to wait his return. He hurried to and fro, and inquired for a young woman dressed in fisherwoman's costume; but all in vain. 'Perhaps,' thought he, 'the young woman has gone on to the *fosse* by herself, being too impatient to wait for me.'

At all events, he thought his wisest plan would be to hasten on; and if the young woman had not arrived when he reached the spot, to inform the officer in command of the troops that the prisoner Antoine Duroc was pardoned. It wanted but three minutes to twelve o'clock when he reached the *fosse*, around which a great crowd had assembled, and in which—their backs placed against a low mound—the doomed prisoners were already drawn up. Approaching a young lieutenant, who was coolly smoking a cigar, as he paced leisurely to and fro, the commissioner informed the young officer that a pardon had been granted to Antoine Duroc, one of the condemned prisoners, and begged him to stay the man's execution.

'Where is the pardon you speak of?' asked the officer. 'Produce it.'

'I do not have it with me,' replied the commissioner; and then he told how he had missed the young woman who was the wife of the pardoned man, and who carried the pardon in her bosom.

'You missed the young woman after you and she alighted from the carriage of Monsieur le Sous-préfet de Police?' said the officer. 'A likely story, is it not? Are you crazed, man, that you imagine the execution will be stayed at the bidding of the sous-préfet? Or is this some trick to gain time? Do you see yonder clock? The minute-hand points at two minutes to twelve. At twelve o'clock I shall give the order to fire.'

There was much jealousy existing at this period between the civil and military authorities, in consequence of the supreme authority being for the time in the hands of the latter; and when the commissioner spoke of the Sous-préfet de Police, the young officer seized the opportunity to snub the police authorities.

'You will repent it, Monsieur Lieutenant, if you do not delay,' replied the commissioner. 'The pardon is signed, by Monsieur le Général

Beaumont, by whom I was directed to guide the young woman to this spot, that she might deliver to you her husband's pardon with her own hands.'

'Signed by whom?' asked the lieutenant.

The commissionaire repeated the name of the General.

'Monsieur le Capitaine!' called the lieutenant to another officer who was standing a short distance off.

The captain approached, and the two officers conferred together. They decided that they would at all events delay the execution for five minutes.

'Then I shall give the order to fire,' said the captain. 'I transgress my duty even in delaying five minutes, unless the pardon be produced.'

The church clock struck the hour of noon. The prisoners, when the first stroke sounded, were seen to shudder, and a low murmur was audible amongst the spectators; but Antoine Duroc, though his face was pale, stood firm and erect, awaiting his doom, while the greater number of the other prisoners appeared to be completely cowed. The handsome, manly appearance of the young fisherman, contrasting so remarkably with the miserable creatures who were doomed to die with him, had attracted the notice of many of the spectators, especially amongst the females. But they were not generally moved to pity. It appeared rather as if they regarded it as a novelty—a fresh attraction to see a handsome young man doomed to share the fate of the other prisoners, and yet so different from the generality of the wretched Communists who, almost every day, were doomed to death.

When, however, the last stroke of twelve had sounded and the order to fire was withheld, the low murmur among the spectators increased to a cry of anger and complaint. 'Why do not the soldiers fire?' they asked of one another. 'What is the cause of the delay? Are we to wait all day long?' And when it was whispered amongst them that a pardon had arrived for one of the doomed men—and it was suspected that the favoured individual was the handsome young fisherman Duroc—they betrayed manifest signs that they considered themselves defrauded of a portion of the spectacle they had assembled to witness. At length the five minutes of delay expired. The order was given to the soldiers to fall into rank and prepare to fire.

'The pardon will arrive, I assure you, Messieurs Officers,' said the commissionaire. 'You had better yet further delay the execution.'

'I will wait two minutes longer, and no more,' replied the captain. 'I have already transgressed my orders. I must do my duty, pardon or no pardon. I have no business to know anything of it until I have seen the document.'

The prisoners had learned that one of their number was to receive his pardon, but they knew not whom, though they somehow suspected that it was the young fisherman who was to be pardoned, and they bitterly resented the favour shown to him by the government.

The two additional minutes of delay had expired. The soldiers drew up. The rattle of their arms was audible.

'Attention! Present arms!' shouted the officer in command, throwing away his half-smoked

cigar. Such events were now every-day affairs to him and his brother *militaires*. Still he hesitated to give the final dread order.

Tir, the word *Tirez*—draw, or fire—was upon his lips, but it was not yet pronounced, when a young woman in a state of wild distraction appeared upon the scene. It was Madeleine.

'You are yet in time, Madame,' said one of the two men who had guided her to the spot. 'I feared we were too late.'

'Thank God!' exclaimed the young girl, raising her eyes and clasped hands to heaven. She caught sight of her husband. 'Antoine, my dear Antoine, my loved husband, thou art pardoned, thou art free!' she cried; and heedless of everything around her—seeing no one save her husband, she was rushing swiftly towards him, when the young lieutenant placed his hand, not unkindly, upon her shoulder and drew her gently back.

'Why do you stop me, Monsieur?' she fiercely cried. 'I go to embrace my husband, who is free. I have brought his pardon.'

'Will Madame produce the pardon?' said the young officer. 'If it be correct, the husband of Madame will be instantly liberated.'

The pardon was produced, and closely examined. The General's signature was well known to both the officers; and the young fisherman, to whom the whole affair appeared like an ugly dream, was set free.

Antoine could scarcely satisfy himself that he was awake, and that everything he beheld around him was reality; for he had heard nothing of his wife's arrival in Paris, and had believed her to be still waiting at Honfleur for his return.

'Is it a dream—a horrible dream?' he asked himself—the legacy, the visit to Paris, the assault of the mob, the rescue of the poor country lad, my own arrest, and trial, and condemnation—everything? These thoughts passed through his mind in an instant. He was dazed; his brain was bewildered; he staggered like a drunken man, and gazed wildly around him. He did not even respond to the embrace of his young wife!

Meanwhile, the spectators continued to murmur; and the miserable men who still awaited their doom scowled enviously and savagely upon him.

'Why is he pardoned, while the other poor wretches are left to meet their doom?' some of the spectators asked. The people were getting accustomed to such spectacles. Still, there were some among the female onlookers who sympathised with the young fisherman and his pretty wife, and wept tears of delight when Madeleine embraced her husband—as they would have done had they beheld such a scene in a theatre.

At length a soldier on furlough stepped forth from amongst the crowd and laid his hand upon Antoine's shoulder.

'Come, *mon brave*, come away,' said he, 'unless thou preferrest to remain to be shot.' And he led the young fisherman away from the *fosse*, Antoine walking like one in sleep.

Scarcely had they gone twenty paces beyond the mound in the rear of the *fosse*, when the sharp stern word of command was heard, instantly followed by the clang of arms and the report of a volley of musketry.

Antoine shuddered, and awoke, as it were,

instantly to consciousness. 'But for the pardon that arrived at the last moment,' he thought, 'that report had been my death-knell! I should be now lying a senseless clod stretched in the ditch!'

Madeleine, uttered a sharp cry of horror and clung tightly to her husband's arm.

The soldier alone seemed to think nothing of the matter. 'Bear up! bear up, comrade,' he said kindly. 'I felt something as thou dost now, when, years ago, in the Crimea, I came near being shot by the Russians as a spy, and when two of my brother-soldiers, as innocent of the charge as I was, suffered death. But I must leave thee now. It will not do for me to be seen fraternising too closely with one who has been condemned as a Communist thief and assassin; though I believe thee to be as innocent of such a crime as I am. Bonjour, Monsieur—Madame, adieu!' And touching his shako, he turned aside, and left the newly restored husband and wife to themselves.

A solemn silence had succeeded the volley of musketry, and then there was a tramp of many feet, and a chattering of many voices, and the crowd dispersed, possibly to gather again and witness such another scene on the morrow. Some overtook, and looked earnestly at the young fisherman and his wife as they passed them by; and one pretty girl stepped up to Madeleine and embraced her lovingly and placed a posy of wild-flowers in her hand.

Antoine and Madeleine had much to tell each other of what had occurred to them since they had parted in the railroad dépôt at Honfleur.

'My beloved husband,' said Madeleine when she ended her story, 'I felt a presentiment of approaching evil when I left thee at the dépôt to return home alone. Could I have had my will, I would gladly have forfeited thy old aunt's legacy, to have restrained thee from visiting this wicked city. But I cannot explain to thee what I felt when thy letter arrived in place of thyself!'

Antoine and Madeleine returned the next day to Honfleur, after having paid a visit to the fair and gentle daughter of the sous-préfet, to thank her for the generous sympathy which had induced her father to exert his influence with General Beaumont in Antoine's behalf. They cared little for the gaiety of Paris, where, amidst so much splendour and wealth, there is also so much poverty, misery, and crime; and determined never, of their own free-will, to set foot in it again. 'Adieu, Antoine!' said Madeleine, as her husband parted from her for his next voyage; 'I would rather trust thee with the wild sea, than with the people of that terrible city.'

BOOK GOSSIP.

IN 1839, a book, written by an Indian administrative officer, was being printed in London, and in this book the Queen had become so interested that she directed the publisher to send her the work sheet by sheet, as it was passing through the press, for her perusal. The book thus distinguished by Her Majesty was the *Confessions of a Thug*, by Colonel Meadows Taylor, then home from India on sick-leave. It has since been read by thousands of readers, alternately charmed

by its graphic and faithful pictures of Indian life and scenery, and awed by the startling revelations of secret and systematised crime which its pages reveal. This was not the only work of its author, though it is that perhaps by which he is most widely known. He finally retired from active life in India, and died at Mentone in 1876; previous to which time, however, an autobiography which he had written was given to the world. It was an expensive work, in two volumes, and thus not within reach of many who would have been prepared to appreciate its pages. We are glad, therefore, to observe that a popular edition in one volume has now been issued of Colonel Taylor's *Story of My Life* (London: Blackwood and Sons); and we can recommend it heartily as a book not only interesting for its personal details, but of historical value for the insight which it gives into the internal administration of India during the last fifty years of the Honourable Company's rule.

Although Colonel Meadows Taylor never rose to a high rank in the civil and military administration of India, 'there were,' says Mr Henry Reeves, editor of the *Edinburgh Review* (who writes a preface to this edition), 'circumstances in his career not less remarkable than in the lives of greater men. He was one of the last of those who went out to India as simple adventurers—to use the term in no disparaging sense, for Clive and Dupleix were no more—who achieved whatever success he had in life by his own energy and perseverance, independent of the patronage of the great Company or the authority of the Crown.' The story of his early life, as narrated by himself, is full of interest. He was comparatively a poor boy, his father having been reduced in the world by unfortunate commercial transactions; and he went out to India, at the first, in no higher capacity than that of a prospective merchant's apprentice. His first appointment proved illusory, and but for the services of kind friends, he would soon have been left entirely to his own resources. In 1824, and while still but sixteen years of age, he procured, from the Resident at Hyderabad, through the interest of friends, a commission in the army of his Highness the Nizam; and this proved to be the first step in a fairly successful military career. It was principally, however, as a magistrate and civil administrator that Colonel Taylor distinguished himself; and even at the very outset of his career he showed a readiness of resource, a firmness of character, and a native instinct towards justice, which were certainly remarkable in one so young. One instance may be given.

While still under twenty years of age, he was acting as Superintendent of Bazaars at Bolarum, in which capacity it was his duty to regulate the markets and the prices of grain, and to act generally as a judge in civil cases. In the course of a journey of inspection through the district, his tent was at one place beset by hundreds of pilgrims and travellers, crying loudly for justice against the flour-sellers, who not only gave short weight in flour, but adulterated it so completely with sand, that the cakes made of it were uneatable, and had to be thrown away. He privately sent for and bought samples of the flour, which he

tested, and found in all cases that it was like sand under his teeth. He thereupon ordered the dishonest merchants to be sent to him, with their baskets of flour, their weights and scales. 'Now,' said he gravely, 'each of you is to weigh out two pounds of flour.' This was done. 'Is it for the pilgrims?' asked one. 'No,' said the young magistrate quietly; 'you must eat it yourselves.' They saw that he was in earnest, and offered to pay any fine he might impose. 'Not so,' he replied; 'you have made many eat your flour, why should you object to eat it yourselves?' They were horribly frightened; and, amid the jeers and laughter of the bystanders, some of them actually began to eat, sputtering out the half-moistened flour, which could be heard crunching between their teeth. At last some of them flung themselves on their faces, abjectly beseeching pardon. Mr Taylor took surety of the flour-sellers that they would not again 'fill the mouths' of the pilgrims 'with dirt;' and so the episode terminated, no more complaints being afterwards heard of bad flour.

This natural sagacity stood Colonel Taylor in good stead on many other occasions, when more than his own life was in imminent danger; and the story of his adventures, difficulties, and triumphs, reads like a page of historical romance. He was proof against that curse of Anglo-Indian administration in those days—bribery; and though many tempting baits were offered him, he proved true to his honour, and carried that honour untarnished to the end.

.

In the death of Emerson, America lost perhaps the most philosophical and thoughtful of her literary men. His works have been long and favourably known in this country, commanding the respect and admiration of thousands of thinking men and women. To Englishmen one of the most endearing features of Emerson's character is his early recognition and loving appreciation of our Thomas Carlyle, Emerson having indeed been among the first, either in the Old World or the New, to see into the depths of *Sartor Resartus*, and to acknowledge the breadth of thought, the manliness of character, the pitiful tenderness towards the poor and distressed ones of the earth, that existed under the satirical veil in which the large-hearted Professor Teufelsdröckh chose to envelop himself when he spoke with the public. Emerson gathered the chapters of *Sartor Resartus* from *Fraser's Magazine*, in which they first appeared, and had them printed and published in America at his own expense, afterwards remitting to Carlyle, at a time when such a gift was very acceptable, the sum of one hundred and fifty pounds as the profits arising from the sale of the first edition of the book.

Emerson visited this country for the first time in 1833; and while in Edinburgh, he was handed over to a young gentleman, a native of the place, who was to act as his guide through the scenes of historic and romantic interest that lie in and around the Northern Metropolis. The young man so introduced to the American writer was Alexander Ireland, who for many years subsequently filled the editorial chair of the *Manchester Examiner*. The intercourse thus begun was continued between them till Emerson's death. Mr

Ireland, now that his illustrious friend is departed, has thrown into book-form a number of reminiscences of their friendship, which he has published under the title of *In Memoriam: Ralph Waldo Emerson* (London: Simpkin, Marshall, & Co.). The little work cannot fail to attract and interest the admirers of Emerson in this country. It is composed of recollections of his visits to England in 1833, 1847-8, and 1872-3, and of extracts from unpublished letters, to which is prefixed a brief but admirable biography.

We have not space for lengthened extracts, but one anecdote may be given characteristic of Emerson's gentleness and patience, even under somewhat trying circumstances, towards those who differed from him. Some twenty years ago, he addressed a literary society at Middlebury, Vermont; and when he finished, the president called upon a clergyman to conclude the service with prayer. The latter, a Massachusetts minister, stepped into the pulpit which Mr Emerson had just left, and uttered a remarkable prayer, of which one sentence was: 'We beseech thee, O Lord, to deliver us from ever hearing any more such transcendental nonsense as we have just listened to from this sacred desk.'—'He seemed a very conscientious, plain-spoken man,' was Emerson's charitable comment on the clergyman and his utterances.

AN UNFASHIONABLE DINNER-PARTY.

SIXTEEN years ago, there was established in London (see *Chambers's Journal* for July 4, 1868), at 47 Earl Street, Lisson Grove, what would perhaps in those days have ventured to call itself an Institution; its object being to provide invalid and sickly children in that airless and over-crowded neighbourhood with a good meat-meal three times a week. The Lady Superintendent had only her own slender purse to draw upon, and the contributions of a few charitable volunteers; the house was small, and one little garret—formerly a workshop—was all the room that could be given up to the little people. Yet nevertheless, in the first year, very many guests were entertained there with such benefits as only doctors—several of whom attend these tiny patients gratuitously—can understand. 'The blood is the Life;' it is the meat that makes the blood; and in many cases the improvement in health wrought by this modest charity has been little short of a resurrection. Those who visit 'the Children's Dinner-table'—they dine at a most unfashionable hour, half-past twelve—do not of course see these convalescents; to get well is their sentence of banishment from this hospitable board; but they will see enough to convince them of the efficacy of the treatment.

Let us introduce you, readers, up the short flight of stairs, with a preliminary caution not to knock your heads against the low doorway, into the Banquet Hall. It looks like a carpenter's shop, scrupulously clean, but with nothing in it to speak of. There is a table on which the meat is carved, and a long low shelf on which the plates are arranged for the convenience of these

'Tiny Tims.' Through the window is seen a vista of squalid buildings; 'back-gardens' that are no gardens, wherefrom this July day the air comes laden with not one summer scent. Not a blade of grass is to be seen anywhere; not a sound is to be heard indicative of the fresh and joyous season. The roar of distant traffic, and the snarling of a hundred cats—the only creatures visible—are the musical accompaniments of the entertainment. The children come dropping in, their little feet toiling painfully up the stairs, by ones and twos. Some are too young—under four years old—to come alone; and almost all are late. Anything more sad than their appearance, though their eyes have a bright gleam in them because of the coming feast, it is impossible to imagine. To those who do not know what sickness means among poor folks, they would appear very ill indeed; but this is not so. Some, indeed, are scrofulous, some have hip-disease, some have abscesses—all, be it remembered, ailments requiring what doctors call 'constant support,' but all are capable of improvement.

The difference between the new-comers and those who are habitués of the Children's Table is very clearly marked. Each has a halfpenny in his or her hand, which he or she gives up to the Lady Superintendent, who finds that this nominal payment renders the benefit conferred more valued by the children's parents. Then they take their seats at a feast such as, except at No. 47 Earl Street, they never partake of save in dreams. The meat is excellent, with plenty of potatoes and gravy; and in summer-time they have always a little fruit. An allowance of half a pound of meat is provided for each; but while some consume that portion eagerly, others—the new-comers—are at first unable to cope with such abundance. As this is well understood beforehand, a portion of the joint always remains; and when the rest have done, the Superintendent gives the order: 'Send out for Somebody.' In Paris, the gentlemen who hold themselves ready to make up dinner-parties are called *quatorzièmes*, and form a comparatively small class. But in the neighbourhood of Earl Street, they are very numerous. It would remind one of the guests who were bidden from the highways to a certain marriage-feast; only in this case they are by no means 'compelled' to come in, but do so with great alacrity. Unlike many of their elders, who feast on rich fare, our little folks know when they have had enough, which they signify by turning round on their bench; and the way in which a very tiny guest will resent being turned round—under the misapprehension that his banquet is concluded—is an amusing spectacle. There is a little creature called 'The Footman,' aged five, an orphan waif of the neighbourhood, who 'waits,' and is himself an example of what continuous good feeding can effect in a child; his wholesome and plump appearance contrasts strangely with that of his less fortunate contemporaries, and forms an excellent advertisement of the Institution.

The good done by the humble charity, as any one may read in its Reports, is as great as the pleasure given, which is saying much indeed. Nor do the benefits it confers stop with this meal, though it is the chief one. Not only can tickets be purchased for sixpence each, or books containing ten for five shillings, to admit sick

children to these entertainments; but tickets for milk and eggs for those who are not equal to beef and mutton. No one who has seen them at their mid-day meal, would refuse his mite to feed these little ones. The faces of some of these invalids, softened by pain and timid from privation, are inexpressibly touching and tender.

Those who help them will be giving the best kind of help. The position of the little Institution is a sad one. Nothing is wasted, nothing save what is barely necessary is spent on 'working-expenses,' and it strives its best to keep going. But the neighbourhood is poor, and the existence of the Children's Dinner-table almost unknown. During the first year of its existence, it supplied seventeen hundred and forty-seven dinners; last year, through want of funds, only fifteen hundred and twenty-nine. Moreover, it has incurred a debt of fifty pounds; a small sum, but one which to this small charity is a heavy burden. Need we say more to those who have hearts and the means to remedy this state of things? It is no form of words to say that 'the smallest contribution will be thankfully received' by The Matron, 47 Earl Street, Lisson Grove, London, W.

THE MONTH.

SCIENCE AND ARTS.

THE case of Electricity *versus* Gas continues to be waged with undiminished ardour on each side. Hitherto, we have had no really reliable data to go upon as to the cost of electric lighting; but now that that form of illumination has come into such extended use, trustworthy figures begin to show themselves. Professor Crookes, who knows a great deal more about electricity than most people, has, in a letter to the *Times*, detailed his experiences of the incandescent system, which for some months has been in use at his house in Kensington. The installation of the new light cost three hundred pounds. He uses a small Bürgen dynamo machine, driven by a three and a half horse-power gas-engine. Through circumstances into which it is unnecessary here to enter, only two horse-power of this engine is available, so that the engine is not able to bring out the full power of the dynamo machine. The system comprises fifty lamps (not all in use at the same time), distributed to different parts of the house; and the cost per annum, as compared with gas, shows a balance in favour of electricity of four pounds seventeen shillings and sixpence. This estimate takes no account of the interest on the capital sunk; but Professor Crookes maintains that this, and the cost of wear and tear, also omitted, are more than counter-balanced by the absence of blackened ceilings, soiled curtains, tarnished gilding, unhealthy atmosphere, and all those minor evils which are commonly urged against the use of gas.

Mr Preece, the eminent electrician to the Post-office, has also done good service in pointing out and correcting the common mistake of

confounding the subdivision of the electric current with its distribution. A given current produced, say, by one horse-power may give an arc-light equal to two thousand candles; but by no known means can this be so completely utilised, when subdivided, as to feed twenty lamps, each of one hundred candle-power. The best that has yet been done with one horse-power is to produce eight incandescent lights, each equal to sixteen candles, distributed as desired. As an example, he points to the largest machine yet made, that of Edison, which maintains twelve hundred incandescent sixteen-candle lamps with an expenditure of one hundred and fifty horse-power. The same power applied to the production of one stupendous arc-light ought to give a light of many million candles. We therefore see that although the incandescent system in the hands of Edison, Swan, Maxim, and others offers at present the only feasible plan of house-to-house distribution, it is a most extravagant way of using the electric current.

The steamship *Labrador*, in a recent passage from Havre to New York, was, by means of Faure's accumulators, lighted by electricity during the whole of the voyage. The 'boxes of electricity' were charged by a dynamo machine on shore just before the vessel sailed; and although eight lights were kept continually in use, the supply of electricity was not exhausted at the end of the voyage. The lamps used were on the incandescent principle, and included those of Edison, Swan, and Maxim.

Captains Burton and Cameron, who accomplished a joint exploration of the gold-fields of West Africa, which only terminated a few months ago, recently gave an account of their experiences before the Society of Arts, London. They found gold in the black sand, in the washings from the hills, not far below the surface of the ground. In the streets of Axim, which must be considered as the chief outpost of this future California, gold spangles glittered after a shower. Gold is even yielded by the 'swish' which passes for mortar, cementing the walls of the houses; and gold-dust is collected by the native women from the sand of the sea-shore. In a word, the country seems to teem with the precious metal, only waiting for capital and labour to pick it up.

The French government have organised a meteorological expedition to Cape Horn, and the French Academy have urged the importance of appointing specialists to the mission for zoological, geological, and botanical researches. Special attention is to be given to the large mammalia, seals, sea-elephants, &c., which are rapidly disappearing; and many other orders of animal life are recommended by the Academy for study.

Some years ago, there was exhibited at South Kensington a number of paintings of plants and flowers, the work of Miss Marianne North, which at the time were greatly admired. Miss North has now presented this unique picture-gallery to the nation; and it finds an appropriate abiding-place in the Botanical Garden at Kew. Miss North is not only an accomplished artist, but an intrepid traveller, for all these pictures have been executed on the spots where the originals grew. And when we note that these spots seem to comprise

every country on the face of the globe, we cannot help feeling both astonishment and admiration at the courage and perseverance of the artist. Miss North is not a botanist in the technical sense of the term; but her drawings are so truthful, that in the opinion of those qualified to judge, they must ever remain a most valuable addition to a botanist's resources. Sir Joseph Hooker writes of these pictures: 'Many of the views here brought together represent vividly and truthfully scenes of astonishing interest and singularity, and objects that are among the wonders of the vegetable kingdom; and these, though now accessible to travellers and familiar to readers of travels, are already disappearing, or are doomed shortly to disappear before the axe and the forest fires, the plough and the flock, of the ever-advancing settler or colonist.' It will thus be seen that Miss North has done a great work in preserving the likeness of plants which in many cases are being pushed out of existence.

The study of optical phenomena would hardly seem to be profitable to one who has the misfortune to be blind; yet it is a fact that one of the most eminent of living authorities on optics, M. J. Plateau, of the Royal Academy of Belgium, has for the past forty years been totally blind. With the view of helping fellow-sufferers, he has lately written a pamphlet describing the curious sensations and experiences which his affliction brings before him; and his account of the spectral tints and lights and shades, which seem to appear before his darkened eyeballs, are specially interesting, and may possibly lead to some practical result. He traces his blindness to a habit which he in his younger days adopted, of looking steadfastly at the sun, in order to study the after-effects upon his eyes. It was several years later that he was smitten with blindness, but not before he had been subject to coloured appearances which seemed to form themselves round gas-flames, candles, &c. He alleges that Galileo records his experiences of similar halos, before blindness supervened in his case. M. Plateau therefore advises any one whose eyes give persistent coloured halos round light sources, to take warning, and at once to consult an oculist.

In the *Nineteenth Century* for May appears an anti-vaccination article by Mr P. A. Taylor, into which a curious error has crept. He gives the mean annual death-rate from smallpox for five years at more than four times the sum it ought to be. Dr W. B. Carpenter, the champion of vaccination, has examined the figures, and shows conclusively that they refer to measles instead of smallpox. Had the figures been correct, they would have formed a strong argument—as Mr Taylor intended they should—as to the impotence of vaccination. Corrected by Dr Carpenter, they go far to prove its efficacy; for they show that the actual mean for the five years in question is little more than half that of the lowest previous period.

Visitors to the Zoological Gardens are familiar with the ludicrous appearance of that long-beaked bird the Malay adjutant, which Mr Marks is so fond of introducing into his pictures. An interesting account of these curious birds appears in a series of notes by Lieutenant Kelham, published in a recent number of the *Ibis*. The two birds in question were kept as pets by the 74th

Highlanders when stationed at Penang in 1877. Although they were not kept in confinement, they never seemed inclined to stray far away from the camp, but would spend the greater part of their time standing opposite to one another, bill to bill, with outspread wings, never uttering a sound. After a time, one of the birds died, and the post-mortem examination—in which the living bird seemed to take the greatest interest—showed that the indigested leg of a fowl was the cause of death. The survivor banqueted on his friend's remains without compunction!

A new disease has been noted as occurring among workmen engaged in the manufacture of bichromate of potash, that brilliant red salt which is used for mahogany-staining and for many other purposes in the arts. The disease commences by a tickling sensation in the septum or partition of the nose which divides the nostrils; and although no actual pain is felt, and to the outward observer no change is seen, the partition is gradually but surely destroyed. No other part is affected, the lungs and throat even retaining their normal condition. At some works in Russia, fifty per cent. of the men proved on examination to be suffering from this new malady. The same salt is used largely in many photographic printing processes, and proves very poisonous to some people, who cannot with impunity touch a solution containing it.

By the government measure termed the Ancient Monuments Bill, certain ancient remains in the three kingdoms are selected for special attention. The owners of these may empower the Board of Works to become guardians, to cleanse, fence, repair, and do whatever is necessary to preserve the remains for all time. The Bill also confers upon the Commissioners of Works the power to purchase any ancient monument to which the measure applies, out of moneys which may from time to time be provided by parliament for that purpose. The Bill further provides an Inspector of ancient monuments, and imposes a penalty not exceeding five pounds, and damages for wilful injury. We wish that it were possible by Act of Parliament to prevent heedless people from cutting and scratching their names on public edifices and monuments. St Paul's Cathedral is a disgraceful example of this abominable practice. The various staircases and galleries leading to the top of the dome are defaced by the names of those who have thus tried to immortalise themselves. Even the trees in Epping Forest bear copious evidence of this nonsensical mania. Can nothing be done to stop it?

Mr Cecil N. Shadbolt has kindly forwarded to us a photograph which he took from the car of a balloon which started from the Alexandra Palace on Whit-Monday last. Mr Shadbolt has written a most interesting account of this, his first essay in aëronautics, which appears in the *British Journal of Photography*. The photograph is a success; but, as may be imagined, has far more the appearance of a map than of a picture; houses, railways, vehicles, and even people are distinguishable; but as the photograph was taken from an altitude of two thousand feet, the said people can be easily covered by the point of the finest needle. Mr Shadbolt has the credit of producing the first balloon-photograph in

which anything at all can be recognised, and although it is far from possessing the perfection which we look for in a picture taken on terra firma, it is, as we have said, a success.

Some balloon experiments have lately been tried in Germany with a new form of aërostat. Although filled with hydrogen, it will not of itself ascend, for its total weight is twenty-one pounds above that of the air which it displaces. A system of vanes actuated by machinery in the car causes the balloon to ascend, or to travel in any required direction. The motor, the nature of which is not stated, is said to weigh eighty pounds, and to give a force of four horse-power. The experiments were thoroughly successful; but—and there is a good deal in this 'but'—the weather was exceptionally calm.

'There is,' says *Iron*, 'a curious work of art in the grounds of the State-house at Columbia, South Carolina. It is an iron casting, commemorative of the soldiers, natives of that State, who died in the Secessionist War, whose names are inscribed on brass tablets at the base. The casting is a perfect imitation of the living palmetto, the favourite tree of South Carolina. The long, thin leaves of iron, lifelike, even to the hair-like fibres of the twigs and branches, wave tremulously in every breeze; and the whole tree, painted artistically, has so close a resemblance to the real tree as to deceive the acutest observer at the distance of five rods. In fact, the tree is a perfect success of the founder's art, and only those who have actually seen it are able to realise to what perfection that art may be brought.'

American Cheddar is the polite name for a mixture of skim-milk and lard, or skim-milk and oleo-margarine, which, according to the Secretary of the Royal Agricultural Society of England, competent judges cannot distinguish from the cheese of which it is an imitation. The food is said to be perfectly wholesome so long as it is made from pure ingredients; but unfortunately, when adulteration creeps into a manufacture, it does not know when to stop. A slaughtered hog in America when found from disease to be unfit for bacon, is boiled down for lard, and it is too probable that such lard might find its way into the newly invented Cheddar. It is suggested that the manufacturer should be compelled to stamp the nature of the commodity 'artificial cheese,' so that buyers should at least know what they are purchasing. From America we are also promised imitation Stilton and other well-known English cheeses.

A lively controversy has been going on in the *Times* relative to the frozen meat which has lately reached the English market from New Zealand. Every one wishes to know what has become of it. A London butcher writes to say that the meat is no better than offal, and that the poor buy it for a few pence per pound. Another correspondent says that the carcasses were eagerly bought up by some of the leading London butchers, whose names he could furnish if required to do so. An importer says that the meat costs him from threepence three-farthings to fourpence per pound, and that he gets from the London butchers fivepence-halfpenny to sixpence farthing per pound for it. We have no desire to sift these conflicting statements. Perhaps the most satisfactory letter of all is that

of one who states that the public will before long be able to decide upon the quality of this class of meat, as arrangements have been made for the direct disposal of future shipments.

Herr Schneider, of Berlin, is supplying horse-shoes of a new pattern, which are said to insure a firm footing upon modern asphalt. The prominences, or calks, are of india-rubber instead of metal, and are fixed in pockets in the malleable iron body of the shoe. The rubber wears out uniformly with the iron; but even if this should not be the case, the calks can easily be inserted by any unskilled hand. Provision is made for a special form of calk for slippery weather.

The Citizens' Sanitary Society of Brooklyn are carrying on a warfare against the use of the ailantus tree, which was introduced from China some years ago, and now shades many of the streets of Brooklyn and New York. Its rapidity of growth and its hardness soon won for it general approval; but it is now urged that the odour of its spring blossoms is unhealthy, causing prostration of the nervous system, swollen joints, and other ailments. The householders and medical men are therefore signing petitions for its removal.

A recent communication by M. Boizard to a French horticultural Society recommends the employment in hot-houses of the vapour of tobacco-juice for the destruction of insect pests. The mode of procedure is as follows: A small quantity of the juice is boiled for two hours, then water is added, and the mixture is boiled more briskly until it all disappears in the form of vapour. The tenderest plants are not injured by this treatment; but it should not be attempted on a hot day. The greater part of the insects fall to the ground; the rest die on the plants. Plants thus treated may be considered safe from the attacks of most insects for about six months.

Mr Maybridge, the famous photographer of America whose 'trotting horse' and other studies of animals in motion have recently made so much stir in artistic circles, recently read a paper before the Society of Arts, London, in which he gave examples of the impossible attitudes given to animals by even the most experienced painters. He regretted that his efforts to get photographic records of the flight of birds had, from the extreme difficulties presented, been only partially successful. But he pointed out the curious circumstance that there were only two nations whose artists ever showed a bird's wings during flight in the downward position. These were the ancient Egyptians and the Japanese. He assumed that painters must be aware that a bird's wings take that position, but that they consider it inartistic so to draw them. We are inclined to think that this new photographic criterion of art may be carried too far. As we have before had occasion to remark, the camera is so much quicker in its appreciation of a moving object than the human eye, that it really has the power of recording attitudes which to us are practically invisible. We require artists to hold the mirror up to Nature as we see her, and not as a rapid gelatine plate observes her. Regarding this a contemporary writes: 'What seems unmistakably true to one expert, seems ludicrously false to another; but happily the world at large need

not greatly concern itself with the disputes. After all, a man's poor eyes are the best visual organs he possesses, and he must do what he can with them. If artists draw horses which convey to the spectator the notion that they are going at extreme speed; if the trot is so represented that it strikes the man who has carefully observed the trot as a truthful illustration of the pace, such drawings will be received and will give pleasure, though hundreds of photographers and scientific men should maintain that they were ridiculous.'

OCCASIONAL NOTES.

A NATURAL BALLROOM.

ABOUT a mile from the market-town of Adelsberg in Austria, and three miles from Triest, is to be seen the most wonderful cavern in Europe, and possibly in the world, called the Adelsberg Cave, and which has been explored for a length of nearly three thousand yards, as far as a subterranean lake. This cavern consists of several grottos from sixty to eighty feet high. The interior resounds with the noise of water, as a little river runs completely through it, forming many cascades on its way, and being finally lost to view in a fissure. This river continues its subterranean course for about eight miles; and after a time, it disappears into the caverns of Laase, whence it emerges as a navigable river called the Laibach. The entrance to the cave of Adelsberg is illuminated by hundreds of candles, and a transparent curtain, composed of large sheets of crystallised limestone, is seen hanging from the roof. The vast hall or ball-room is about one hundred and eighty yards from the entrance. It is three hundred feet long, and one hundred feet high, and is adorned with transparent stalactites of every kind of fantastic shape and form. Until the year 1819, this ball-room was the only part known; but at this date, the wall of stalagmite was broken through, and a series of chambers exposed to view possessing a cathedral-like appearance, from the stalactites in many instances forming vast columns, by meeting the stalagmites below. In the Adelsberg Cavern, numerous specimens are found of the proteus, a kind of lizard that dwells in the bottom of cavern-lakes.

AUSTRALIAN BUSH-TRACKING.

'An extraordinary instance,' says the *Brisbane Courier*, 'of the powers of Australian bushmen in "tracking" is reported from Carcoar. On Monday morning last, 30th January, a Mrs Green, living at Mile-post Creek, in the Carcoar district, had occasion to go away to her neighbour's, leaving her child, aged two years and six months, in bed, believing it would not attempt to get up during her absence. In this Mrs Green was mistaken, for on her return the child could not be found; and the fact of its being clothed only in a little nightgown caused the parents more anxiety, especially as it was a fiercely hot day. A search was made by the neighbours, assisted by a man named Judd, noted as a clever tracker, who followed slowly on the infant's tracks (which were at times lost in the scrub) for about thirty

hours, when the little thing was found, safely quartered in a hollow log twelve miles from its home. The child was somewhat sunburnt, but otherwise quite well.'

THE CASTOR-OIL PLANT AS A FLY-DESTROYER.

We have long been accustomed (says a correspondent of *Land and Water*) to look upon the castor-oil plant as an ornament for our apartments; but I recently came across an article in *La Nature*, wherein M. Raffard, member of the Horticultural Society at Limoges, stated that a castor-oil plant, raised in a pot, placed in a room infested by flies, caused them to disappear as though by magic. On seeking to ascertain the cause, a large quantity of dead flies were found scattered around, whilst several others were stuck to the under part of the leaves. It appears that the leaves of the castor-oil plant exude an oil which is poisonous to all the insect tribe. It is not without interest to have it proved that the castor-oil plant, which is so ornamental, can resist the air of a *café* or other heated room where the temperature is so variable. As this plant grows very large, and is cultivated in almost all gardens, would it not be worth while to try a decoction of these leaves to destroy the blight and other insects which injure our plants and fruit-trees?

THE RUNNING-MAN TARGET.

Last year we took occasion to notice the invention and patenting, by Mr W. B. Blaikie, Edinburgh, of a running-man target for rifle-practice. The target, as then explained, is made of stout millboard, cut to represent a man, life-size, and painted to the fancy of the shooter. It is suspended from a wire, along which it runs; and can be worked by one man, who, while operating, is protected in the ordinary marking-butt or mantlet, and can signal the hits without leaving cover. The purpose which this target is meant to serve—namely, to test a rifleman's ability to hit a moving object—is a commendable one. To shoot at a fixed target, and to shoot at a moving figure, are very different things; and if our Rifle Volunteers are to be serviceable in the field, they must be able to do more than merely make 'points' at an object that never moves. To show how much practice is needed in shooting at some such moving object as the running-man target, we have only to instance what took place at this year's meeting of the Edinburgh and Mid-Lothian Rifle Association. There were competitions at the running-man target (life-size), moving at from four to eight miles an hour, and at two hundred yards' distance. The great proportion of the competitors were crack-shots; yet the following was the result: Out of eighty-four shots fired on the first day of the meeting, there were seven hits; on the second day, out of eighty-eight there were four hits, and out of a hundred, nine hits; on the third day, out of seventy-two shots, five hit; and on the fourth day, out of two hundred shots, eighteen hit. That is, out of five hundred and forty-four shots fired by otherwise competent marksmen, only forty-three in all—or eight per cent.—struck the 'running-man.' This seems to speak strongly for some more efficient means of rifle-practice than by fixed targets, being

adopted both for our Volunteers and the regular army.

WATER-SPECTACLES.

During this the bathing season, some of our readers may hear with interest of a recent invention calculated to enhance the pleasures of that healthy and agreeable pastime. Most practised swimmers vary their watery evolutions by an occasional dive; in these descents, however, all attempts to discern objects generally result in little more than a vague vision of shimmering patches of light and colour. This indistinct perception is caused of course by the very different refractive power of water from that of air—the medium to which the complicated and delicate apparatus of our eyes is adapted. To restore, then, distinct sight to the immersed eye, such a lens is needed as will compensate for the difference in refractive power between air and water, and cause the focus of rays of light, reflected from visible objects to our eye, to fall flush upon the retina, as is the case when we are in our normal element, instead of falling beyond it, as occurs when the eye is submerged. Such a lens has been devised by Dr Dudgeon; and diving-spectacles fitted with a pair of such glasses are manufactured by a London optician, Mr Adie of Pall Mall.

EVENTIDE.

Tired of its own bright charms, the golden Day
Rests in the arms of Evening; all is still;
Nor leaf, nor flower moves, lest the spell might break
Which holds the Earth bound fast in twilight chains.
From yonder hawthorn tree, some leaf-hid bird
Breathes to the dying day a soft farewell,
That, mingling with the stillness, seems to weave
Into the silence threads of melody.
Wild roses, since the dawn, have deeply blushed
Beneath the Sun's warm kisses; now at Eve
Faint odours, passing sweet, possess the air—
Rich incense offered to the Queen of Night!
For lo! a silvery light falls all around,
As up the violet heavens a pale young moon
Climbs high, and higher still.

A low-voiced breeze,
Rising with balmy sigh amid the hills,
Comes ling'ringly adown the rocky glen,
Floats o'er the uplands, kisses every flower,
And whispers that the fair, sweet Day is dead!
Now restful thoughts and calm enter the heart,
And soothe the tired brain; as from on High
A blessing falls on everything below:
Cool shades to Evening—rest and peace to Man.

AGNES M. MACONACHIE.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. To insure return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. MANUSCRIPTS should bear the author's full *Christian* name, surname, and address, legibly written; and should be written on white (not blue) paper, and on one side of the leaf only.
- 4th. Poetical offerings should invariably be accompanied by a stamped and directed envelope.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

GOLD.

WE understand better than the ancients the cause of what has been aptly termed, the hunger for gold. It is not a mere lust for wealth, a passionate avarice, a heartless selfishness that makes mankind seek the royal metal wherever it may be—a metal which alone furnishes a basis by which the transactions of international commerce can be carried on. As the frontiers of trade invade the savage parts of the earth, all local standards of value are discarded in favour of gold. Cattle, cloth, shells, and other things, useful or conventional, lose their exchange utilities; and a time is coming when gold will be the universal intermediary. The consequence will be a general levelling of values all over the world, and that means that the enjoyment of the fruits of his labour will be assured to every toiler. Thenceforward, no savage will dispose of the products of his native land for beads, bits of glass, rum-bottles, or Birmingham-made idols. Between him and the trader's greed, gold will mediate. In Britain, during the abundant supply of the metal, it has banished the truck-system, and brought master and man into truer financial relationship.

The history of modern commerce is the history of gold-discovery. Looking through the four centuries that have elapsed since Columbus revealed a New World to the Old, we see how much gold had to do with the exploration and settlement of the West. It was owing to the mass of precious metal poured into Europe by the Spaniards from the plunder of Mexico and Peru, that the commerce of the sixteenth century sprang forward more than it had done in all preceding time. A hope to obtain gold in fabulous quantity led to the immense emigrations from East to West. No other lure could have induced men to undergo the perils of the menacing Atlantic, which had held the boldest at bay. The desire for American gold, like another Crusade, blended many races into a mighty host, and broke down many insular barriers for ever.

In a wonderfully short time, considering the strange character of the adventurers and the smallness of their ships, much of the New World was explored by the searchers for the Eldorado. If they failed to find that wonder-land, other marvels were achieved. New nations were added to the human family, invaluable productions were added to the stores of trade, and the huge Pacific Ocean to the water-ways of commerce. Geography became a science.

The business of Europe was phenomenally vitalised by Spanish-American gold. It quickly found its way to the real centres of trade in Italy and Holland, leaving Spain as fast as it entered. For gold then, as now, gravitated to those who knew best how to use it. By rapine and fraud, the mild natives of Mexico and Peru had been dispossessed, and their spoilers fell under the ban which blights ill-gotten wealth. Wherever there was commercial ability in Europe, the new gold and the new domains of trade were taken advantage of. England felt the impulse of the time perhaps more than other countries; but every one, even the most barbarous, was precipitated upon that mercantile path which all pursue today.

After the supply of American gold had diminished, Africa was sedulously explored, and the Gold Coast furnished the Dutch, Portuguese, French, and English with what sufficed to keep up the accelerating movements of commerce that went on through the seventeenth century. India, China, and other parts of the Eastern world contributed; but the demand was never appeased. In the eighteenth century, as the British dominion began to supersede native rule in India, large quantities of gold found their way westward; with the result of expanding trade both foreign and domestic.

But owing to ignorance of the real part gold plays in commerce, the development of international trade was retarded, and at times suspended by the follies and crimes of merchants, and by the policy of governments. Commercial wars and national piracies retarded the progress

of business, and perpetuated the savagery of human nature. Men had to learn by painful errors that gold is the machinery of trade, nothing more. To get it and keep it in the country was the object of nations; to get it and hoard it, the object of individuals. Only a few scientific men understood that all trade, whether internal or external, was simply a bartering of commodities or an exchange of services; the vast majority believed that gold was all in all. Hence it was sought for everywhere, and some of the greatest *savants* devoted life and knowledge to the search for a chemical agent which should convert the baser metals into gold. As the light of to-day's effulgent science falls upon the blunders of philosophers and upon the errors of economists, we are amazed that men could have been so misled as to the true way to wealth. Yet, coming generations, judging us by a still more potent science, may also be astonished at *our* errors. Barbarous policies still divide the foremost nations from each other, and forbid that fraternal reciprocity of service upon which human happiness and progress wholly depend.

The acceptance of gold as a common medium furnished mankind with an instrument of illimitable potency, and one that was indispensable for the solidarity of nations. Political economy had to discover its relationship with commerce, and some fundamental truths were arrived at by the close of the eighteenth century. How they were applied in knocking off the fetters of commerce, is well known. Our present object, however, is to note the consequences of the great gold-findings, which took place when the value of gold was better understood. Steam-industry and locomotion were among the factors of trade when the Californian discoveries sent a thrill of excitement throughout the world; and the electric telegraph just starting to girdle the earth, spread the glad tidings that the true Eldorado was found at last. The new gold multiplied railways everywhere; mechanical industry supplanted handwork in every department of activity, and all the concrete sciences and useful arts were greatly improved. Each became prolific causes of material and intellectual wealth. Vast multitudes went to California from every state in America and Europe; and an immense sutler-host followed the army of gold-diggers, to supply its wants and its whims. This large draught upon labour facilitated the transformation of industry from its individual methods to the associated system. Lancashire and Yorkshire no longer rebelled against steam-power and factory organisation. Californian gold bridged over the terrible chasm which had threatened to engulf thousands of cotton and woollen operatives in an abyss of hunger. A hundred new employments absorbed the people whom steam had dismissed from their wonted occupations, to re-engage them in other and better ones. The inventive spirit of the time was not less manifested at the gold-fields than in the domain of industry. Mining was immensely facilitated by the machines and contrivances which came to help the gold-getter to liberate the metal from its rocky matrix and to wash it from its hiding-place. Moreover, geology stepped in and explained the mystery of auriferous deposits, and saved mankind from a vast waste of time and money.

Just as Europe had shot forward meteor-like in the sixteenth century, by the impulse it received from American gold, so in the nineteenth century, another and infinitely greater movement followed the discovery of Western treasure. A reverberation of activity, of speculation, of adventure thundered into the remotest villages, and aroused the supinest to fevered expectation. Ranks and classes began to assume new attitudes to each other; social rigidities gave place to unloped-for elasticities; external events settled internal disputes; emigration liberated energies from dangerous restraints at home to beneficent activities abroad.

While Californian gold-finding was electrifying mankind, astounding reports came from Australia of auriferous deposits unparalleled by all previous discoveries. The precious metal was said to be picked up in boulder-like masses upon the surface of the ground. When nuggets of incredible weight were shipped to England, and gold markets quaked with apprehension of a deluge that would utterly subvert all values, such a furor set in as had never perhaps been known in the world before. A gold-fever pervaded civilisation. The 'finds' in California had prepared men for almost anything; but this preternatural quantity of gold lying in the mysterious solitudes of the 'newest world,' made the placers and the mines of America seem insignificant. A frenzy to possess the fascinating metal waiting for owners seized upon multitudes of every order of mind, and almost every grade of society sent representatives to the Australian diggings. The strong, the weak, the poor, the rich, the learned, the illiterate jostled in a mighty stampede to the Southern Eldorado. But speedily they were differentiated into ranks and conditions, that few had dreamed of when starting on the common quest. Civilisation shaped their ends in spite of themselves. Extraordinary metamorphoses took place. Gold-getting was an art that only some could prosecute. More than *desire* was needed to win the metal from its recesses. The idle, the incompetent, the unstable, the vagrant, failed in the gold-fields, as they had failed in other fields at home. The head-learned became subordinate to the hand-learned. University-men became the cooks and washermen of navvies and sailors who tracked the ore to its home. Young curates took to a pastoral life of another kind than they had known in Britain, and tended sheep on the Plains. Cockney roughs, who had disturbed the peace of their native Metropolis, maintained order in the antipodeal mobs. Country bumpkins were transformed into colonial magnates, wandering pedlers became merchants and bankers. Convicts rose from ignominy and despair to honour and wealth. Such a terrific sifting was never seen previously, as went on in Australia during the rushes from one gold-field to another, and while the social edifice was being sketched. The fate of millions was profoundly changed, not only in Australia, but at home. So great a commingling of men and ideas had never occurred before. California had interfused many tribes, kindreds, and tongues; but things went on in Australia on a larger scale and with greater rapidity.

Great as were the social consequences of gold-finding in Australia itself, they were still greater in England and Europe, as the golden river poured

into the channels of trade. The last vestiges of feudalism tottered to their fall; and associated industry spread into every country. Joint-stock Companies began to supersede individuals in commerce; for the wealth of the world was now in many hands. Wages rose, and the hours of labour fell universally. The education of the masses of the people was also thereby rendered more than hitherto possible. A new and remarkable confidence in the *future* began to affect mankind. Heretofore, the Golden Age had been placed in the irrecoverable past, and men had accepted the doleful belief that an inevitable degeneracy was the fate of humanity. With the new gold and the innumerable instruments of wealth it created, a new faith in the brilliant destiny of posterity arose. The deductions of science warranting this were eagerly caught up. Theories and speculations that would have been rejected with contempt twenty years before, found ready acceptance.

For thirty years this time lasted, and then the golden harvest shrank into smaller and smaller crops, men's hopes falling proportionately. Gold was still got in California and Australia, and new fields in New Zealand had been discovered. But the yield was not encouraging; the fever was over. The demands of commerce were infinite; for it had dilated to the extremities of the planet. Moreover, the influx of gold had affected the monetary equilibrium of the world, compelling all states to make it their standard, while the wear and tear of coin was vastly greater than in earlier times, from the rapidity of circulation. Gold, like other substances, perishes in use. Tough and coherent as it is, the transfer from hand to hand and from pocket to pocket grinds it into impalpable dust, which is withdrawn from man's service for ever. Nevertheless, though some may talk of a gold-famine, we may be on the eve of a gold-supply far more abundant than any previous ones.

Recently, Captain Burton, the celebrated traveller, has reported that almost illimitable gold can be obtained at the Gold Coast, Africa, a district which has been auriferously prolific for centuries. He says the region is equal to half a dozen Californias, a statement that might be doubted if made by a less capable authority. The testimony of the great traveller is supported by another illustrious discoverer, Commander Cameron, who visited and investigated the Gold Coast along with Captain Burton. Gold is found in the sea-sand, in the dust of the roads, and in the mud walls of native huts. Several mining Companies are engaged in gold-finding in the district, and they testify to the great possibilities it affords. A subject of such importance has of course been widely discussed by experts in England; and by this time large numbers of prospectors are doubtless verifying matters on the spot.

There are many difficulties in Africa that did not confront the gold-diggers of California and Australia. The climate has its dangers; the inhabitants are savages; the rulers, suspicious and hostile to strangers. But where abundant gold is to be got with ease, white men will go; and the capital of civilisation will flow thither, bearing ten thousand energies to confront those of nature and barbarism. The want of gold is

so great, that the world must have it at any risk; and were it guarded by all the savages of Africa united into a single host, it would become the possession of commerce. When geologists and specialists have pronounced a favourable opinion, and diggers have proof positive that a great gold deposit remains to be worked, the difficulties with natives will soon be solved. Medical science can mitigate the evils of the worst climate. During the thirty years of great gold-discovery, the art of mining and washing for the metal has made more progress than in all antecedent time. Everything favours a speedy translation of African gold into the channels of international trade, should it be found in the quantities alleged by Captain Burton.

But beside enlarging the possibilities of external civilisation, African gold would introduce an enduring civilisation into Africa itself, in those equatorial regions that have hitherto remained barbaric. California and Australia have given their auriferous treasures to the world, and in return have received a far greater enrichment in agricultural, pastoral, and mechanical wealth. Metallic deserts have been changed into industrial empires, that will enrich man for all coming time. So, in equatorial Africa, when gold has disappeared, civilisation will remain. Who can say what commercial future awaits the inhabitants of the Dark Continent, when once they are affiliated with the rest of the human family in the bonds of trade?

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

BY DAVID CHRISTIE MURRAY.

CHAPTER XXX.—SHORN OF WEALTH AND SHORN OF ALL.

THE strong spring sunshine lay, at random broadcast, on sea and shore, and the great spring wind came roaring like the voice of a lusty giant. There was scarce a cloud in the sky, and scarce a cloud in happy Gerard's mind. Stout Roland, feeling the spring in his veins, caracoled hither and thither with arched neck and mincing feet; and Gerard felt all the horse's joy, and in the pauses of the ride lifted up his voice and sang for gladness, at the eager wind and the wide sunshine and the hope of half an hour hence. He was riding to see Constance, and that of itself was enough; and besides, Gerard was one of those men to whom riding is the most delightful of all physical pleasures. So, with Roland curveting and prancing and making a mighty pretence of scorn at all things—with a tender measured fineness in every motion the while—Gerard came up to the lodge-gates of the Grange, and called for the lodge-keeper with a voice of jollity. Out she came, shading her eyes from the bright light, an old woman, who had kept the lodge for the old family.

'They be all gone to town, Muster Lumby,' said the old woman.

'Gone to town?' repeated Gerard in a voice of disbelief.

'Yes, sir,' said the old lady, 'all the fambly.'

Gerard sat without reply for one dismal minute, and then turned away.

A happy lover, who has come
To look on her that loves him well,
Who lights and rings the gateway bell,
And learns her gone and far from home.

He saddens; all the magic light
Dies off at once from bower and hall,
And all the place is dark, and all
The chambers emptied of delight.

He hung his head on the way back. There was no pleasure in the keen wind and bright sunshine on the homeward ride. Home reached, he found a note, just delivered by one of the Grange servants. It came from Constance, and ran thus:

DEAR GERARD—My father and Reginald are both going to town, and since I cannot be left in this great house alone, I am to go with them, and be taken to my Aunt Lucretia's. You will not forget to write to me. We shall be away for at least a week.—Yours truly, CONSTANCE.

The note was cool enough, but all Constance's missives had been cool, and so Gerard felt the absence of no accustomed warmth. Yet none the less the brief iciness chilled him, and he was puzzled by the command to write, and by the absence of an address to write to. This was the first he had heard of Aunt Lucretia, and he knew no more of her whereabouts than the note told him. He had a reticence about writing to Constance through her father, whose address he knew; and he felt, with a proud sense of undeserved injury, that if she had of purpose aforethought omitted her address, he would wait until she sent it to him. The bright spring hours began to go heavily. Val Strange had mysteriously disappeared, and Gerard was lonely and altogether ill at ease, until on Thursday morning came a telegram from the offices of the firm, under the hand of Mr Barnes: 'Please come to town by first train. Make no delay.'

'Your father has been away four days, Gerard,' said Mrs Lumby, 'and has never written me a line. That is very unusual, and it makes me a little anxious. You must tell him to write at once.'

The call to town revived Gerard's spirits. He was going to have a fortune put into his hands, and that meant freedom to marry so soon as Constance could be persuaded.

'All right, mother,' he answered lightly, kissing her. 'I won't forget.—Good-bye, Milly. Get ready,' he added with a compound smile, in which a most hangdog aspect blended comically with a beaming joyousness—'get ready for your orange blossoms.' Milly nodded gaily from the hall; the young fellow got into the dogcart beside the groom, and waving his hand, drove away. Pleasant thoughts were with him on his journey, and his spirits seemed to leap the higher for their late depression, as a branch released swings upward. His little bitterness about Constance was all dispelled; and as he rode through London streets towards the offices, he whistled like the mavis. Looks are not easy to define, or Gerard might have read pity in the face of the very porter at the doors, and

pity again in the face of elderly Johnson at his desk.

'Good-morning, Johnson,' said Gerard cheerily. 'Is my father here?'

'No, sir,' said the old clerk. 'Mr Lionel and Mr George are up-stairs.'

Mr Lionel and Mr George were the junior partners, Gerard's cousins. There was a marked sadness on the old man's brow, and a melancholy quaver in his voice.

'How glum you Londoners are, Johnson,' said the young fellow. 'Why, if you meet a ploughman in the country, you hear him whistling—out of tune most likely, but still whistling. They catch the habit from the birds, perhaps. But all you people look as if you were assisting at a funeral.'

'This way, sir,' said Johnson. 'Allow me.' He led the way up-stairs, turning half round to Gerard with a respectful bend. In the room which had been Garling's, sat Mr Barnes and the junior partners.

'Good-day, George,' said Gerard cheerily.—'Good-day, Lionel.—How d'ye do, Barnes? All here to help me into El Dorado, I suppose.—Where's the governor?'

The cousins shook hands with him solemnly, and Barnes bowed with saddened visage.

'Well, upon my word,' said Gerard, looking from one to the other, 'you're a cheerful lot, to be sure!' As he looked, his own face caught something of the shadow which lay on theirs.

'Sit down,' said his cousin Lionel. 'We are in trouble here.—Mr Barnes, tell him all you know.'

'First of all,' said Gerard, anxiously looking from one to another, 'where is my father?'

'At his hotel,' said Cousin George. 'He is not well; in fact, he is seriously unwell; but don't be afraid for him. Sit down.—Tell what you know, Barnes.'

At that, Barnes told all he knew, as we know it already; and Gerard listened amazed, almost beyond amazement.

'In the course of the evening,' pursued Barnes, 'I met Mr Lionel and Mr George. They had heard of the unfortunate circumstance of the cheque, and I gave them your father's assurance that everything would be right to-day. We were all naturally anxious, and we arranged to meet here at nine o'clock this morning—an hour earlier than usual. Mr Lionel and Mr George will tell you that they called at your father's hotel and could hear no news of him.'

'I called,' said Lionel, breaking in gravely, 'at Garling's place, to see if he knew anything. They told me he was away—the people at the shop beneath the rooms he lived in—he had gone away with a lady on Tuesday night.'

'With a lady?' cried Gerard.

'A young lady,' returned Cousin Lionel. 'He had taken an extra room for her some days before, and spoke of her as his daughter. She called him her father; and their joint story was credited.'

Gerard sank back in his chair, feeling like a man in a nightmare.

Barnes went on with his story, from which it appeared that the three reaching the offices at the appointed hour, found the night-porter and his wife in a terrible flutter of alarm and

excitement, having two hours before discovered the head of the firm insensible upon the floor of that room.

'It was probably providential,' said Barnes in conclusion, 'that in falling, he had slightly wounded himself and had lost a little blood. I am bound to say that the watchman and his wife seem to have acted with great promptitude. The man ran at once for a surgeon. Your father was removed to his hotel; a physician was sent for, and everything that skill could suggest had been done before our arrival.'

Gerard saw despair confronting him, and but an hour ago he had been so happy!

'We have done what we could here,' said George Lumby, rising and folding his arms across a burly chest. 'We have turned over the whole of our private balances to the credit of the firm. That is but a drop in the ocean,' he added sorrowfully; 'but'—lifting his head and striding across the room—'it may help us after all.'

'We conjecture,' said Lionel, 'that your father knows something we do not know, and we think that if we can tide over a day or two, he may save us. George and I have given instructions to realise on all stock we hold, and we *may* make a stand. But the cheque yesterday, and Garling's flight, and your father's sudden illness, have an ugly look. We are talked about everywhere, and we expect to be pressed. The small-fry have been at us already, and have been paid. We shall stand out as long as we can.'

The very prosperity of the firm had led the partners to their ruin. It had been so profitable to pour their profits anew into that great reservoir, that they had invested but little outside it, and now the treasures of the reservoir had sunk, as into some great subterranean cavern.

All day the ominous City talk went on, and men spoke of the great House as doomed. It was believed that Garling had got away with prodigious sums, and so his pre-eminence amongst keen fellows remained undisputed still. There were some adventurous spirits who were willing to take long odds against the breakage of the firm; and sportive clerks offered the market betting on the event, as if it had been a sort of City Derby. Once that day the firm was hit hard; and the junior partners took up a great bill of which, until then, they had known nothing, and waited with what stoicism they had for the next blow to fall. Gerard, feeling as if his heart had been one great ache, sat down and wrote a letter to his mother, disguising from her the ills that had befallen, and striving to write lightly, whilst his heart sank over every word like lead. 'Do not expect to hear from either of us for a day or two,' he wrote, 'for we are most prodigiously busy, and have no news which you unbusiness-like country-people would care to hear.'

Mrs Lumby reading this next day, took it for a jocular affectation of the cares of commerce worn for her amusement by the new partner, and she and Milly had a laugh over it. But a day or two actually going by, and she hearing no more, she wired a message of inquiry to the offices.

'You must answer it,' said George Lumby, who took it down to the hotel to Gerard. 'She

will be up here, otherwise.—How is he?' nodding at the door of the sick-room. Gerard had taken the dressing-room outside the chamber in which his father lay, and stayed there day and night.

'He knows nobody,' said Gerard sadly. 'Smiles at his fingers like a child, when he awakes.'

'Have you spoken to him?'

'Yes. He knows nobody. The doctor says he is out of danger, bodily.'

'He fears for his mind? Permanently?'

'I am afraid so,' answered Gerard with a dreary sigh.

'We may go at any hour,' said George gloomily—'at any hour.'—Gerard answered only by another sigh.—'We are all in the same boat, Gerard. Wire to your mother, and tell her not to be alarmed, and then write to-night.'

'Yes, yes,' answered Gerard; and his cousin went sadly away again. At that moment the door was rapped by a waiter, who brought in letters for Gerard, re-directed and sent on from the Hall by Milly. He looked at them absently, and seeing that one came from Constance, he opened it and read it. She wrote as coolly as ever, but bade him come to see her if he should come to town, and gave her address this time. Icily brief as it was, the note would have made him happy a day or two before; and now, having read it, he laid it to his breast with a great sob, and hung his head, as if to hide from the mere daylight the blinding tears in his eyes. But recovering himself after a while, he answered his mother's message, and afterwards sat down and wrote her a cheerful letter, asking her to come to London, and telling her that his father had been unwell, but was recovering now. 'She will think it a slight matter,' he thought; 'and why should she be troubled, poor soul, before her time? She will be troubled enough, when she knows.'

When she came next day with Milly, she found her husband sitting up in bed, with a pinched and vacant look upon his face. He knew nobody, but smiled at her—an awful smile—and talked disjointedly of things that had happened years ago. Then Gerard discovered that his kindly meant deceit was cruel; for the shock well-nigh cost his mother her wits, and for an hour or two she was pale and helpless and as cold as marble. But a great fit of crying coming to her aid, she recovered herself, and sat down beside her husband's bed; and she and Milly watched there to the exclusion of all others but Gerard and the doctors. They told her nothing of the affairs of the House, thinking one trouble enough at a time. Gerard sent no word to Constance, but waited like a man condemned until the last stroke should fall. It fell on Tuesday, a week and a day after the elder Lumby's arrival in town. The two junior partners came together in the dusk of the afternoon, and he saw the doom of the House in their faces.

'It is all over,' said the elder of the two in a commonplace voice.

'Yes,' said the other. 'We closed the doors at half-past two. We heard it cried by the news-boys in the streets as we came here.'

Gerard took up his hat and made as if to leave the room; but there was such a look upon his face, that the two cousins, exchanging a swift glance, stepped between him and the door, and

each laid a friendly hand upon him. 'Where are you going, Gerard?' asked George.

He looked at them, first at one and then at the other, and reading their fear, shook his head, and tried to smile. 'I am going to see my sweetheart,' said the simple Gerard, choking down a sob. 'I must tell her what has happened, and say good-bye. She can't marry a pauper; and I don't want her to learn the news from the papers. I sha'n't be long away. You can keep it from my mother for a time. She has enough to bear.'

'They know it in the hotel,' said George. 'The very waiters know it. We are all in the same boat, Gerard.'

They shook hands sadly, as men before now have shaken hands in shipwreck, waiting for the shock and the plunge; and Gerard passed into the streets, and walked, deep beneath the waters of despair. How he reached the little house in Chesterfield Street, he never knew; but he stood at last before the door, and asked quietly for Miss Jolly; and sent in his card and waited. To the day of his death, he will not forget that waiting. It seemed long, long before the little parlour-maid returned and marshalled him upstairs and into Constance's presence. She came with a languid grace to meet him, and held out her hand; but at the sight of his face, paused, and looked at him with greating eyes.

'I have come to say good-bye,' he said. His heart was like ice in his breast.

'Good-bye?' she answered. 'Gerard! What do you mean?' She fancied she read something like a threat in his manner. Looks are hard to read, and the reader is likely to see himself reflected in their characters. She was fresh from thinking of Val Strange. Of what was Gerard thinking?

'Yes,' he answered; 'I am here to say good-bye. You can't marry a pauper.' His voice was strained and harsh, and he spoke with difficulty. 'The House has failed. I have come to tell you so, and to give you back your freedom.'

'The House has failed? The firm?'

'The firm of Lumby and Lumby is bankrupt,' he responded. 'I won't detain you,' he added helplessly, not knowing what words found their way to his lips. 'Good-bye!' With that he turned, and suddenly flung both arms abroad with the ultimate gesture of despair, and dropped them, heavily, at his sides. What could she say? What comfort could she offer? What consolation could reach him? 'Work and hope, and I will wait.' Ah, she was not free to say that. She might have said it to the man she loved, and have dared her father's opposition, and poverty, and the cankering cares of waiting years, as many a maid had done before her for a true man's sake. But she had no such balm for Gerard, who being shorn of wealth, was shorn of all.

Perhaps in some inmost corner of his heart he waited for some command which should give him life again. Perhaps, at the sight of his despair, she half wished that she could give it. She touched him timidly on the sleeve, awed by the silence of his grief, for she knew that he had loved her well, and she guessed at something of his miseries. At that touch he turned, and for one passionate moment held her in his arms;

then, with a cry like that of some wild creature in extreme pain, he released her, and rushed from the room and from the house.

* * * *

Constance, thus left alone, was filled with many struggling emotions, amongst which it would not have been easy for any philosopher to discern the uppermost. Gerard had half frightened her by the wildness of his farewell; and she would have been less than woman had she been unmelted by his grief. His trouble, as it referred to her, naturally touched her less than did the loss of his fortune. 'Me?' she thought (and not unwisely, for she judged from what she knew), 'he will grieve because he has lost me, perhaps for a month or two; but he will feel the loss of his fortune all his life.' She could not, struggle as she might, disguise from herself the fact that she was pleased to be free. She had never greatly cared for him. Since that first day when the warmth of his ardour had a little touched her heart, he had never raised a thrill in her. And since then, Val Strange had risen on the horizon of her life, and in spite of herself, she had glided into such a love for him as she never guessed or dreamed before. Yes; she was sorry for Gerard, but she was pleased to be free. And yet, Val had gone away; resolutely bent on curing himself, and to that end had set an inexorable distance between himself and her, and might stay away for years. Why, since it was to come, could not Gerard's misfortune have come a week sooner? She hated herself for that cruel thought; but it was there, and she could not drive it from her. Poor Gerard! She respected him greatly, and liked him, coldly; and if she had been an empress with gifts to give, she would have given him a new fortune, and have taken joy in the gift. She could scarcely have been sorrier for his loss if he had been her brother. But he had many friends, and amongst them Gerard would do very well. Anything like the bitterness of downright poverty was of course impossible for him. He could never come to that.

Gerard pacing lonely in the gas-lit streets, gave the lost fortune little thought. There was grief enough for him in his mother's grief, in his father's helplessness, in his own loss of love, and hope of love. He had always been so used to money, that the prospect of poverty could take no hold upon him. Only those who have felt the gripe of poverty know so much as how to dread it. In the midst of his afflictions, poverty seemed likely to be the lightest, and it was certainly the only one amongst them which a heart at once sound and gentle could at first sight scorn. It was burned into him that he had come away without one word of farewell from Constance. That seemed hard. But she had never made any great pretence at caring for him, and his thoughts began to be bitter. Yet poor Gerard was too simply noble to hold that mood long, and by-and-by he began to defend her, and to yearn over her, and to pray that whatever came to him, she might be happy. He even tried to take pleasure in the belief that she had not loved him, on the ground that she would not grieve at his leaving her; but at that his sorely-tried heart rebelled. He would like her to feel some grief at that—a little.

Some thirty years ago, the Sage of Chelsea

preached one dogma, worded thus—'By all means, at all times consume your own smoke.' For the carriage of this dogma into practical every-day working, Gerard was peculiarly fitted. He said nothing of his personal griefs to any man or woman. He avoided all mention of them to his mother even, and resolutely and heroically fought them down. But the conflict wore him thin and pale; and in the midst of all their distresses, Milly and his mother had no keener grief than this of Gerard's. The days went on, the great bankruptcy was noised abroad, and other lesser bankruptcies followed it in due course. Garling's vast fraud widened and broadened in its consequences, as great crimes will; and people who had never heard of him, and never did hear of him, went hungry because of him. The properties of the firm were sold at auction; the very desk at which old Johnson had sat these fifty years was knocked down to the highest bidder before the veteran's sorrowing eyes; the very ledgers went for waste paper, all but the latest; the premises themselves were sold, realising a price so vast that creditors reading it grew easier in their minds; the senior partner's private properties were impounded with the rest, stocks and shares and balance at the banker's; and Lumby Hall was in the market.

Then it came out, when the panic was over, that there was enough for everybody, even the lawyers, and that there was a little to be saved after all. But in the middle of the distresses, and in this pale gleam of joy which followed them, the head of the great wrecked House of Lumby and Lumby sat like a child, with no more than a child's joys and a child's sorrows, smiling at the sunlight playing on his wall, or whimpering to be lonely in the dusk. His memory was a ruin. He knew nobody.

CANCALE AND ITS FISHERIES.

CANCALE is the name of a commune or parish situated in the department of Ille-et-Vilaine, a division of the ancient French province of Brittany. By the same cognomen are also known a small but deep bay within the larger one of Mont St-Michel, and a village standing on the summit of very high cliffs, a mile or so from the sea. But the long row of houses and cottages, the pretentious hotel, the wine and other shops built upon a narrow slip of land just above high-water mark, which tourists visit, and assume to be Cancale, is only the fishing-port of La Houle (Anglicè, 'The Surf'); and if the said tourists have been there when a strong north-wester is blowing, and have seen the waves dashing and foaming upon the shore, they will be satisfied that the place deserves its appellation. The bay along which La Houle stretches is nearly a crescent; one arm—its eastern—reaching towards Mont Dol; the other—its northern—jutting into the sea. This last bears so close a resemblance to the snout of a pig, that it has been called from time immemorial *Le Grouin de Cancale*—*grouin* being the French for the nozzle portion of porcine organisation. The bottom of the sea between the two headlands just mentioned, and indeed somewhat beyond them, is thickly covered with a sort of ooze, highly favourable to the production and habits

of the oyster, for which Cancale and its neighbourhood have been long celebrated. But as dredged some little distance from land, and brought and deposited nearer in-shore on what are called *parcs*—beds of mud and stones—the mollusc obtains no other food than that supplied from salt water, and although it grows under the diet, yet it acquires a strong briny taste, not agreeable to the majority of French epicurean consumers. To remedy this, the following plan is adopted. The oyster is taken while young from the *parcs* hereabouts, and sent to other localities where natural springs of soft water mix with the salt; and surprising effects result under the advantages of procuring sustenance from the elements of both fluids. Thus, at Marennes, near La Rochelle—one of the *parcs* of this nature—the Cancale oyster loses its bitter saline taste, increases enormously in size and thickness, and becomes that dark-green colour which is so repulsive to Englishmen, who are accustomed to white or pearly natives, though highly appreciated by Gallic gourmands.

The fishing-fleet of Cancale, both for dredging oysters and catching fish, numbers more than two hundred lugger-rigged craft of small tonnage. These boats are owned partly by single individuals, partly by their crews, who have clubbed together for co-partnership. Their tackle and gear cost as much as the boats and sails; the nets—which are chiefly made at Nantes—being the great item of expense. The seine is never used; the trawl, which is fitted with a huge head-bag or receptacle, being the sort of snare generally adopted. Each boat has a functionary called 'a mistress'; that is, a woman who has contracted, under certain conditions, for the sale of the take of the craft. The crew have therefore nothing to do with the disposal of the fish. The produce of the sale effected by the 'mistress' is generally divided into five parts—two to the owner or owners of the boat, one to her skipper, and two to the crew, the woman having previously deducted her legitimate profits.

The life of a 'Cancalais,' as these fishermen dub themselves, is one even more rife with danger than that of others of their calling. The bay of Mont St-Michel is one of the most perilous seas in the world. Equinoctial tides rise in it to the height of fifty feet, and ordinary tides to thirty-five feet. The distance between high and low water marks is more than six miles in some places; and the rapidity of the currents, especially on a stormy day, maelstrom-like. Quicksands, too, are numerous, and a boat shoaled on one of them during ebb-tide, has little chance of its crew being saved; as regards itself, none. In calm weather, the boats fish in the shallowest waters, their keels occasionally heeling in the mud; and here they take soles, turbot, doree, brill, and skate, in considerable quantities. Government forbids fishing within a mile of the shore; but so soon as night sets in and screens the fishermen and their fleet from the look-outs of the steam gunboat at Granville and the coast-guard sailing-schooner at Cancale, the boats are run within the proscribed limits, and the forbidden fruit is tasted. Oysters are allowed to be taken only on certain days at certain times of the year, a strict watch being kept by the two vessels above mentioned, from

which signals are made when dredging is to commence, and to cease. Fishing proper, however, goes on all the year, the only restriction—with the exception of the fixed distance from shore, as already mentioned—being that of *mailage*, or size of the meshes of the nets. Meshes wider by a fraction of an inch only, having been ordered by government to be used, and their use continued for a few years, brought the population of Cancale to the verge of starvation, fishes that were entangled before, escaping now. In fact, so momentous a question is this one of *mailage* among a class of individuals who earn their living from the depths of the sea, that candidates for state or municipal offices invariably promise the electors to obtain for them the privilege of smaller meshes for the fishing-nets; that promise, whether carried out or not, being the only safe 'card' for securing success. *Mailage* is the bugbear of the Canca-lais.

The hardy Cancale fisherman is essentially a religious man. The very words of the skipper of a boat as he directs his crew to cast the net and begin trawling, show him to be so. 'À la grâce de Dieu,' says he, as the huge snare goes over the side. The Canca-lais belong to the purest Breton race, a pious one in thought and in deed; and a single glance at the small pier of the haven of La Houle will be sufficient to reveal their character and that of their belongings. On that pier is erected a signal-post with a night alarm-bell, to notify danger to the fishing-fleet at sea; also, a stone cross, where the women come, when that ominous bell sounds, to kneel and pray. Many are the heart-rending scenes witnessed here, when, after hours of deep supplication and anxious watching, it is found that the boat on board of which is a husband, or a son, or a brother, is not numbered among those that have weathered the tempest, and happily reached the anchorage. As many as fifty or sixty boats have been lost in one tide, and one-fourth of the inhabitants rendered thereby objects of public charity.

The great man at Cancale is the Naval Commissary. He settles all vital questions, and represents the Minister of the navy. He looks to every minute observance which binds the fishermen—who are always under the articles of war—to the government; he can try them by court-martial, or send them to prison with a word. He is another of the 'bogies' of their surroundings.

The crew of each boat cannot be fewer than four—namely, the master or skipper, with two men and a boy. During the Crimean War, however, all the fishermen were drafted by government into men-of-war. A few disabled sailors, old men, and boys under fourteen years of age, and the women and children, were the only persons left in the villages of La Houle and La Cancale. Starvation stared them in the face; but the women set to work, and, with the aged and crippled seamen and the youths not in their teens, 'manned' such luggers as they could, fished as well as they could, and saved the district from commercial obliteration, although it has not even yet recovered from the depression this abnormal state of things entailed.

In the summer season, fewer hands are needed on board the fishing-craft than during the bois-

terous winter-time; hence all superfluous seafaring men, together with many a landsman unused to plough the main in any shape, but who has a fancy, nevertheless, for creating what he calls a little *pécule*—stock of cash averaging about twenty pounds for five months—embark for the Newfoundland cod fisheries, returning therefrom when autumn sets in. These Newfoundland crews are remarkably unmaritime, only a very few being genuine 'salts,' the rest being composed of individuals expert in the preparation of the fish, and of landmen to whom sea-sickness is an ordinary sensation. With elements like these packed in unseaworthy ships, many a Breton merchant is enriched, and many a Breton home desolated. However, as Kingsley sings:

Men must work, and women must weep.
And there's little to earn, and many to keep,
Though the harbour bar be moaning.

It may not be foreign to this paper to say a word or two on a phase of the law affecting the marine in France, since it has already been mentioned that the fishermen of Cancale are under naval subjection. Every sailor, whether in the merchant service, or enrolled in a reserve of that of the state, is liable at any time to be called 'to the flag,' and to do duty on board a man-of-war. While so employed, a part of his wages is assigned to the feminine portion of his relations—his mother, wife, or sister; and although the share is somewhat moderate, yet it is eagerly sought for by young women, who, if for nothing else, at least for the dole in question are desirous of obtaining Jack's hand. A *délégation* is the name of the document conferring upon the lady the right of drawing the assigned money, and among the Canca-lais maidens it has passed into a by-word. So, if you hear Marie or Céleste of La Houle say to her bosom-friend, '*Je vais être déléguée*' (I am about to be delegated), understand that she means that Pierre or Antoine, the smart fisherman, is about to lead her to the hymeneal altar, and to give her the right of pocketing the regulated part of his pay while he is serving.

In conclusion, as we stroll along the calcareous beach of the place we have faintly endeavoured to sketch, a host of children will follow our footsteps, asking for sous. Let us put our hands cheerfully into our pockets and give. The little supplicants are not beggars in the ordinary acceptation of the word; they are the sons and daughters of those whom the Crimean War made orphans.

PLAYING THE WRONG CARD.

IN FOUR CHAPTERS.—CHAPTER I.

At a distance of sixty odd miles from London, stands Fieldenham, a small town of some three or four thousand inhabitants, and consisting, as do many such places, of one long street, with branches leading in the direction of the various neighbouring villages, to which it stands in the relation of metropolis. It is as peaceful and quiet, as dull and monotonous, as any small country-town need be; so that the stray visitor from London is won, to exclaim against the stagnation of the place, and to wonder what its

inhabitants can find to interest them sufficiently to keep them alive, or at anyrate awake. In this manner do those who dwell in the great centres of population speak of petty towns and villages, forgetting that the drama of life has just as much engrossing interest for each of its actors when played on the tiniest stage in the world, as when it has the Metropolis itself for its theatre.

A little way from the town—a quarter of a mile, perhaps, from the hostel which marked the end of its High Street—stood a house known as the Elms Knoll, or more frequently 'The Knoll' only; and here dwelt Mr Maurice Hythe. This gentleman was highly valued by the townsfolk on account of his promptness in payment, and absence of cavilling at whatever prices were charged; yet they regretted that he was of such secluded habits as seldom or never to be seen in the town. Moreover, no guests ever came to the Knoll, nor were those who called out of courtesy, encouraged to repeat the ceremony. Mr Hythe was an invalid, which partly accounted for his recluse habits; but he was, besides, a man of silent, almost morose manners, and wherever he was, the place was the gloomier for his presence. This was the testimony of his servants, who were likely to be right in such a matter. He had neither wife nor children; it was reported that he was a widower; but even his servants did not profess to know with certainty. He had perhaps chosen his residence from his hermit-like tastes, for it lay a long way back from the road, and the demesne was fenced and screened on all sides by lofty hedges and tall trees—a screen which became denser year by year, as the owner would not allow the hedges to be trimmed, and so the grounds grew to have a wild, lonely aspect.

When Mr Hythe had been at the Elms Knoll some four years, another strange family came to reside near Fieldenham, in itself an uncommon event; but what made it more singular in this case was, that the new-comers bore the same name as the proprietor of the Knoll, and then it was found that the head of the new family—Mr Ignatius Hythe—was a brother of the elder resident. This was gratifying news to Fieldenham; for the new-comer was not only married, with five or six children, the eldest, indeed, being a young man of nineteen or twenty years, but he was a broad-faced, loud-speaking, bustling man; had been a surgeon in the army; was altogether different from Mr Maurice, and therefore likely, it was hoped, to effect a great change and improvement in the domestic economy of the Knoll. Time passed, however, and this improvement was not visible. Those who were on the alert to note what was going on in the neighbourhood—and these comprised, it is probable, every living soul in it from seven years of age upwards—reported that while Mr Ignatius Hythe was a frequent visitor at Elms Knoll, he was never accompanied by his wife or any of his children; nor did his brother ever return the visit. Thus far it was easy to see; but beyond this no explanation was obtainable; so the habits and peculiarities of Mr Maurice Hythe continued to be a tantalising problem to the townsfolk.

It was on an evening in midsummer, when

one of the long beautiful June days was declining, that the brothers were walking at the back of the Knoll House, pacing to and fro in a small meadow which, from its position and the closeness of its 'hedgerow elms,' formed the most retired spot of the demesne, and therefore, doubtless, the favourite retreat of the owner. It was so silent and gloomy indeed, as to be depressing for a man of Mr Ignatius Hythe's temperament, and of his own free-will he would never have sought such a promenade. He said something of this to his brother, by way of breaking a long silence. Maurice turned his thin sunken face towards him, and with a smile which was almost more bitter than it was sad, said: 'You have not gone through the discipline, Ignatius, which has been my lot.'

'Discipline!' began the other; but evidently altering a speech which was intended to be sarcastic, continued: 'But I was thinking, Maurice, that there was a time when you were the more hearty and lively of the two; and now'—

'And now I am a gloomy misanthrope—perhaps a madman, you would say,' interposed Maurice. 'But what I am, I have made myself; what I suffer, I have brought on myself—as you know.'

'I know that you brood too much on the past,' returned his brother. 'Why don't you let bygones be bygones? You can't recall the past.'

'No!' exclaimed Maurice; 'I cannot, or my grief would not be so bitter. I have had the vision again, Ignatius; that is twice. On its third coming, it will be my death-warning. I have seen my solicitor, and all is settled, as I have told you.'

Ignatius smoked his cigar in silence, and there was an increased depression about him, which implied that this announcement was not altogether to his taste. His brother, too, walked silently on, but there was nothing unusual in this.

'It is of no use my urging you to go among people again,' said Ignatius at last. 'I would stake my life that a single month of cheerful, rational society would get rid of all this hypochondriacal delusion. It is nothing more. However, I will not press the matter; I know what you are. You will not even see the doctor I recommended, I suppose?'

'No, no,' replied Maurice. 'If he saw my wasted and broken figure, he would try all the commonplaces of his art upon me, and perhaps, when he heard me speak, would suggest still greater seclusion, or even restraint. His remedy would not be yours—the mixing with cheerful society. My present mode of living may seem to you a kind of penance; but penance is now all that I ought to live for.'

Ignatius had probably anticipated some such ending to the discussion; for he made no attempt to prolong it, but spoke on different subjects, and ere long took his departure. The cheerfulness and bonhomie which had marked his manner during almost the whole of his interview with his brother, disappeared when he found himself outside the Knoll gates; and during the walk to his own residence, the expression of his face was as sombre as his brother's in his gloomiest mood.

His home was at a smart modern villa, much smaller, much brighter-looking than the Knoll, and commanding from its windows all the gaiety which the high-road could afford; for there, no overgrown hedges or shadowing trees intercepted the view. Mrs Hythe, a lady of middle age, was seated at work in a parlour commanding the aforesaid road; and to her the gentleman at once repaired.

'Well,' he began at once, 'I have had it out with him.'

'Indeed!' exclaimed his wife. 'And what does he say? Does he'—

'Oh! there is nothing fresh,' returned Mr Hythe. 'The only satisfaction I have gained is to know that all is settled against us. I call it against us; of course he does not.'

'What! all that nonsense about trustees and so on?' inquired the lady.

'Exactly,' said her husband. 'It is all settled now; the lawyers have done everything. His property will remain in the hands of trustees for twenty years—all except that paltry sum in the funds; then, if no one appears in that time, it will go half to us or our heirs, and half to that precious hospital.'

'Twenty years!' echoed his wife. 'What good will it be to us in twenty years?'

'Not a fraction,' said Hythe; 'and there will be no raising money upon it; for although there may be a possibility of these shadows and dreams turning to realities, yet who would lend money on such a remote contingency?'

'He is mad; he ought to be put in an asylum!' exclaimed Mrs Hythe angrily.

'Of course he ought,' assented her husband; 'and I can't think where the common-sense of his doctor has been—to say nothing of his conscience and the duty he owes to society—that he has not had him declared out of his mind, and put where he would be taken care of, long ago.' Mr Hythe's tone and air as he said this were sufficiently decided to show that his conscience at anyrate would certainly have counselled the 'taking care' of his brother after this fashion. He could not bear to sit quietly down under the disturbing influence of these thoughts, but announced his determination of taking a stroll into the town; and in pursuance of this resolve, set out, after a few minutes' further conversation with his wife.

Myrtle Villa, the name of Mr Ignatius Hythe's residence, was not farther from the town than was Elms Knoll; the Knoll facing a cross-road, while the Villa, as intimated, looked upon the great London highway; so that Mr Hythe was not long in reaching the entrance to Fieldenham. Although the sun had disappeared, the light out in the open country was still clear; but in the town, under the shade of the buildings in the long High Street, the dullness of twilight prevailed, and in nearly all the shops the gaslights were burning.

Some idea of business was possibly attached to this evening stroll, for he knocked at one of the smartest yet most substantial houses in the street, the door of which bore a large brass plate, on which was inscribed 'BRAFF and MARDLE, Solicitors.' In answer to his inquiry, however, it appeared that Mr Mardle was not within.

'It does not greatly matter,' muttered Hythe,

as he turned away; 'he could not have helped me; nor could he have told me anything I do not know.'

He was so absorbed in his reflections, that he was rather surprised to find himself standing opposite to the *King's Arms Hotel and Posting-house*—its old title, which had descended from a past generation, but was now, as regarded the Posting-house, little better than a myth and a fable. In addition to this, the establishment held the Assembly Rooms also; and Mr Hythe had unconsciously halted in front of two large bills, which, affixed to boards that leaned on each side of the doorway, announced that some performance would be held there that evening. He found that Professor Alberto Regaldini, assisted by Mademoiselle Lucile la Petite Tuscano—he smiled as he read these incongruous names—would give his refined entertainment from the Royal Scientific Gallery, London, and as performed with triumphant success in all the chief cities and towns of the British Empire; introducing, the bill went on to say, the celebrated Monologue, in which Professor Regaldini would sustain six separate characters, with appropriate songs; and concluding with a grand ballet, supported by the before-mentioned Mademoiselle Lucile and Professor Alberto. There was a great deal of this; the changes were rung on the names in every possible way; but it was clear enough that there were no other performers, unless we reckon the celebrated pianist Herr von Joinville as one of the Company. Beyond these three at anyrate, no other names appeared.

Moved by a sudden impulse, which, to judge from the cynical smile accompanying it, was hardly complimentary to the expected entertainment, Hythe entered the portal. He went along the silent and empty lobby until he reached what was evidently the pay-place; but no one sat at the receipt of custom, till, while he hesitated what to do, a young man appeared from the adjoining bar, evidently attracted by the sound of footsteps; so Mr Hythe judged from observing that he passed the back of his hand quickly over his lips, on seeing the stranger. 'I will take a ticket for this entertainment,' said Hythe. 'It has commenced, I presume?'

'Just this minit, sir,' said the young man. He knew it had been in action for half an hour, but, as he afterwards observed to his friend, 'he wasn't going to crab the business.' 'Reserved—stalls—or area, sir? Reserved is two shillings—stalls, one shilling—area, sixpence, sir. No half-price.'

'If there is room in the reserved, I will take one of them,' said Hythe.

'O yes, sir; you will find room there.—Thank ye, sir,' continued the young man, as he handed a yellow ticket marked 503, which, from its worn and limp condition, had evidently done duty many a night before.

Mr Hythe passed through the green baize-covered door, and found himself in the Assembly Room. It was a large dull-looking place, with walls divided into old-fashioned panellings; a number of Windsor chairs and forms; a raised platform at the further end. The room would have seated between three and four hundred persons comfortably; and there were some seventeen or eighteen present. No one at all in the

reserved seats; the hotel proprietor's children in the stalls; townspeople in the area.

Professor Regaldini was bowing and leaving the stage as Mr Hythe entered; having just concluded his *Mysterious Marvels of Modern Magic*, as performed before the Court and Aristocracy—for the Professor was a conjurer also—and then the pianist struck up the *entr'acte* music. Hythe was able to tell that the haggard-looking man at the pianoforte was no common player; and he listened, with more interest than he had anticipated, to a piece which must have been *caviare* to the multitude.

Then Professor Regaldini came on for his celebrated Monologue Impersonations, and was in succession a Yorkshire farmer, a bonnie fish-wife, a swell of the period, a Highlander, Paddy from Cork, and Mr Pickwick, spectacles and all. No doubt it was all very clever, but dreary; so horribly dreary, and so suggestive of something seen a hundred times before, that the scanty audience could not be roused to enthusiasm by the performance. Then came duets in character and out of character, by Mademoiselle Lucile and the Professor; and then the Grand Ballet, which would have been more miserable and depressing than anything that had gone before it, but for the wonderful grace and beauty of the child. She was only some twelve years old. The feeble, awkward dancing of her toilworn coadjutor; the wretched attempts at scenery or decoration; the empty room, with its hollow echoes—all were forgotten, or rendered of no account, by the extraordinary accomplishments of the girl, and Hythe found himself watching the dance with interest to the last. He would have remained to the last, had this performance been even more tedious than all which had preceded it, as an idea had formed and developed in his mind, while watching the earlier portion of the 'entertainment.'

The scanty audience filtered slowly from the hall; the gas was turned down; the 'Company'—which, all told, consisted of the two performers, the musician, and the young man who had taken Mr Hythe's money—began folding up 'properties' and clearing off their miserable bits of scenery, &c. All this time Mr Hythe was standing in the darkest corner of the room, unnoticed, or perhaps supposed to be connected with the house; but when the last article had been put aside, and the little group stood in the centre of the platform, counting over the few shillings which evidently constituted the takings of the evening—while the burly proprietor of the hotel eyed them curiously from a little distance—all looked up with a start as Mr Hythe came forward; and he thought the scared expression on their faces indicated a dread that the stranger might be about to make some demand for money. 'The entertainment is over,' began Professor Regaldini. 'I beg your pardon,' he continued, altering his tone; 'I believe I saw you in the reserved seats?'

'Yes,' replied Hythe; 'I had the pleasure of seeing the entertainment this evening. I see it is announced for two nights only. Your stay in the town will not be longer, I suppose?'

'Yes, sir; it is announced for two nights,' said the Professor in a lugubrious tone, and with a glance at the proprietor. 'But the patronage

received does not justify us in repeating the show. We shall not give the entertainment again.'

The Professor was a tall, hungry-looking man, narrow-chested, and stooping, without a trace of any nationality about him save the English, and London English too. A certain asthmatic shortness of breath, which made itself apparent every other minute, showed what a trial his work of that evening had involved. The other members of the Company were standing around, dejected enough, yet with a certain expectant curiosity, as though hoping something might come out of this unlooked-for discussion.

'Well, it is not to the credit of the town to neglect such a performance as yours,' continued Hythe; 'and for our reputation, I think something ought to be done to support you. If you are not engaged, I would ask the pleasure of your company at supper here, with, of course, Mademoiselle and Herr von Joinville.—Mr Bartell'—addressing the proprietor of the hotel—'you can give us a tolerable supper at once, no doubt?'

'Oh, certainly, sir!' exclaimed the landlord, who was no stranger to Mr Hythe, and knew by repute the wealth of his brother. 'In ten minutes, if you please, sir.'

'Then let us have the best you can put on in that time,' said Hythe. 'I leave all to you. Your champagne I know already is good.'

A flush lit up the haggard faces of the two men at this mention of a wine which showed the character of the expected feast; and being invited by the landlord to adjourn to the 'small club-room,' the party followed him at once, due provision being made for the regalement of the assistant elsewhere.

On their way, the Professor stole an instant to whisper to the pianist: 'This is capital, isn't it? But I wonder what he means by it?'

CONVICT SCHOOLS.

BY A CONVICT SCHOOLMASTER.

It was the opinion of Sydney Smith that education—mere book-learning—should not form part of a convict's training. Lord Norton, at a Social Science Congress some few years ago, expressed a similar opinion. That convict schools as at present conducted are failures, is the opinion of many men more practically acquainted with the schools in question than either Sydney Smith or Lord Norton.

Convict prisons and their doings generally are mysteries to the greater part of the outside world. The old-world idea, that cruelties innumerable are being perpetrated daily on the unfortunate inmates, has not yet been exploded. To be more correct, to a large proportion of the inmates, convict prisons are sanatoria where they may recruit their bodily strength, and school their already profound criminal knowledge for further and more extensive depredations on society. A very small proportion, indeed, find a convict prison a worse home than the roof-tree they have left. Surely there is evidence of this in the fact, that a very large percentage return the second, third, fourth, and even fifth

time, to enjoy its immunity from anxiety and the general troubles incident to an honest life. But all this will be found set out fully in *Five Years' Penal Servitude*, a book which contains much truth on the subject.

A convict on admission to prison is examined by the senior schoolmaster, in order somewhat to test his ability; and is placed in one of four classes, three of which attend school, while the fourth—about two-thirds of the whole admissions—are excluded, and never, under any pretence but that of letter-writing, are allowed to be present during school-time. This last class includes men of various educational attainments, from those who have received a university education, down to those who are just able to write a letter legibly and pretty correctly as to orthography, to read, say, an ordinary magazine article, and to work arithmetic up to and including weights and measures. When any man of the three school classes arrives at the above educational standard, he is consigned to the non-attending class. These last are allowed, and largely avail themselves of the privilege of having advanced educational works in their cells, including popular and technical educators, text-books of the sciences, dictionaries, &c. Many, during the hours they have to spare, learn a language, or even two, as well as these can be learned without a teacher. Shorthand is a favourite subject, and one which I am afraid is acquired in most instances for doubtful purposes. Those who attend school are taught in much the same way as are similar classes in an ordinary National or Board school.

At this point may be described the kind of men employed by the Civil Service Commissioners as schoolmasters. Originally, there were various methods of admission to the service. Influence was everything in many cases, and consequently unfit men may still be found among convict schoolmasters; but for many years the only channels of admission have been either through examination by the Civil Service Commissioners, or the candidate must be in possession of a certificate from the Education Department—a certificate similar in every respect to, and gained in the same way as that held by London and provincial Board schoolmasters. In fact, the majority of convict masters were originally either National or Board school-teachers—men who have passed five years as pupil-teachers, and two years at a Training College.

Now as to the farcical nature of the school. Convict prisons possess all the plant and mechanism of ordinary schools—teachers, scholars, apparatus of all kinds in abundance; but here, for all practical purposes, the matter ends. The teaching done is practically *nil*, as will be seen from the following facts. The average time allowed each scholar is *one hour per week*, and out of this hour must be deducted the coming to and returning from school, serving out and

collecting material, &c. It is during these hurried minutes, then, that the schoolmasters have their sole opportunity of teaching their grown-up pupils, the greater part of whom are 'dense' to the last degree. If education be at all necessary and beneficial to prisoners, why give eleven hours per day to labour and meals, and but one poor solitary hour per week to improvement of the mind? Why give them just sufficient education to disgust them with their slow progress? Is it probable, is it possible that the schoolmasters can work any improvement? As matters at present stand, both teachers and taught gradually become careless of what the result may be. The great majority of convict schoolmasters would hail with delight any change which would make them something more than nominal schoolmasters; at least all those would do so who have not become entirely deadened to higher aims by their long connection with such a demoralising system.

The question will naturally arise: What are the schoolmasters doing the rest of the day? Well, everything but teaching—superintendence of prison library, registration of prisoners' correspondence, and a host of other duties very right and proper in themselves, but quite foreign to what is generally considered a schoolmaster's work. Taking the week round, his duties average about five hours per day, or equivalent to the time given by a teacher in a Board school, and four out of the five hours are given to extraneous work.

It is the opinion of many persons practically acquainted with the teaching of convicts, that individual or 'cellular' teaching, as pursued at Pentonville and Millbank on the 'separate' system, is the method best adapted to the teaching of such men. There is a shyness, almost unknown to most children, to be found among even the worst of men, which prevents them showing their ignorance; there is a reluctance to begin at the bottom rung of the educational ladder, and thus lay a good foundation. Apart from this is the evil arising from intercourse at school, an evil which is not a light one. Close supervision will not prevent all the harm. There are no incentives to work, as in an outside school, and a lazy scholar infects the whole class. The proportion of scholars really anxious to improve their minds is very small, and these few in a short time relapse into carelessness, partly from contact with their lazy comrades, and partly from disgust at the small amount of attention given to them by those who should be their teachers. Take the case of a middle-aged man ignorant but anxious to learn, being placed by the side of an equally ignorant but quick youth. The older man is ashamed that the youth should see his utter ignorance, and the youth almost invariably, as becomes young criminals, 'pokes fun' at the old man's laborious efforts to form his letters, or to construct words from letters.

This brings us to a question which probably has not received the attention from the authorities which it deserves. Many old men—seventy years of age in many instances—who are averse to receiving any instruction, and who, in all human probability, will never leave the prison alive, are yet forced to attend school simply because they have not arrived at the arbitrary educational

standard set up by the authorities of the prison in which they chance to be confined. These men remain at school often for years, setting a bad example to the younger men by their inertness, and taking up, without the least show of progress, the time which could advantageously be given to the younger men. In their particular line, these old men are often much more apt teachers than the schoolmasters, and take a sort of fiendish delight, though one foot is already in the grave, in instructing their younger brethren in the way which makes them criminals all their lives. It is contended by practical men that 'cellular' or individual, in opposition to class teaching, is the remedy for this state of things. Speaking generally, convict prisons are nurseries of crime and criminals; and nothing pleases the inmates of a prison so much as to see an 'old lag' return to them for a fresh term of penal servitude.

It would be obviously unfair to apply to convict-prison schools an educational test similar to that applied to ordinary day-schools; but now that county jails are under government, there is no apparent reason why an inspector should not be appointed to visit, periodically, all prison schools, both county and convict, in order to insure in some degree uniformity of matter and manner. At present, each chaplain has his own idea of the standard at which a prisoner should arrive before being considered in a position to be removed from school.

To sum up. Give more time to school; make a more judicious selection of scholars; provide individual teaching; and allow the schoolmasters to give their whole time to teaching. These alterations, with some general official supervision, would, it is believed, produce results somewhat commensurate with the money spent on convict schools.

WILL STOUT THE PARISH BEADLE.

A CHARACTER.

In this quiet, out-of-the-world place, the last of the local Scottish 'worthies' died out with old Will Stout the parish beadle. We admit the stern necessity of getting rid of able-bodied beggars and tramps, yet we owe the poor-laws and the combination houses a kind of sentimental grudge for having devoured our 'gangrels' and wandering minstrels, whose periodic visits were so welcome, especially at farmhouses, during the long winter evenings. Their tales and ballads were a source of never-failing interest to the servants and children. It was a red-letter day when the 'auld sodger' came round to spend his evenings in the kitchen, and sleep in some warm corner of the barn or cow-house. The children stole away from the parlour—where their parents were deep in Boston's *Fourfold State*, or vainly puzzling over Jonathan Edwards—in order to join the kitchen group, as they listened with open mouths to tales of the Peninsular War, rehearsed with some embellishment by the 'auld sodger,' as he vigorously flourished his one remaining arm to illustrate his deeds of heroism.

We can well remember, too, the pleasure with which we children welcomed the visits of 'hunch-backed' Singing Sandy, a lingering remnant of the wandering minstrel fraternity. Too lazy in

his younger days to work, Sandy had gradually acquired wandering habits, into which he fell the more readily from being slightly weak in intellect. It was a standing tradition among the boys that his 'hump' was a made-up one; and certainly Sandy knew how to produce effects. On arriving at a village, his first proceeding was to enter some cottage where he saw roses were plentiful, and get the goodwife to fix a garland of them—the reddest being preferred—round his old battered Kilmarnock bonnet, when forth he issued with a kind of boyish exultation, flourishing his stick round his head, and delighting the hearts of the children with the song of *Rolling-eye*:

Oh, whaur are ye gaun, my bonnie bonnie lass?

Oh, whaur are ye gaun, my honie?

Right modestly she answered me,

An errand to my mammie.

With my rolling eye, faul the diddle eye,

With my rolling eye dum dary.

From the popularity of this song, with its unfailing chorus, to which Sandy danced as vigorously as his stiff joints and rheumatic frame would allow, he was generally known by the name of 'Rolling-eye,' and the song was regarded as in some way his own especial property. *Johnnie Cope* was another of his songs; but never took the place of *Rolling-eye* in the children's estimation.

Another welcome visitor was the 'chapman,' whose little pack, with its many-bladed knives and its tinsel gauds and jewellery, made the boys' teeth water, and the girls' hearts leap with anticipation. His sales were certainly not such as to increase his fortune; but then the pretence of gaining an honest livelihood was an excuse for obtaining meals—for by some strange coincidence the packman invariably made his appearance at meal-times; nor was he in a hurry to depart and push his trade, till he had rehearsed the local news and delighted the youngsters with some marvellous stories.

These harmless and more or less welcome characters are every year becoming rarer. As long as we had the old beadle, our parish possessed a character of the genuine old type. The beadle in a country parish is an official of no small importance, at least in his own eyes. He has frequently very mixed duties to perform. He is grave-digger, church-officer, bell-ringer, sometimes minister's man, gardener and general-worker, or jack-of-all-trades. If he has been long in the office, he becomes a great authority on all subjects of a purely parochial nature. With us Will Stout had been beadle for over fifty years, and while ministers might come and go, Will remained, apparently a permanent institution. In personal appearance Will was long, lanky, and ill-shapen. He was generally invested in the minister's cast-off clothes, which hung so loosely about him as to give the impression that they had been made for Will at a time when he was of a fuller habit. It was only in his later years that we knew him. By that time, being the older official, he had come to regard himself as of nearly as great importance to the parish as the minister himself. The attendance at this remote parish church had been less affected by the influence of dissent than some neighbouring ones, and Will thought that

he was entitled to no small credit for this. A stranger a few years ago remarked on the large attendance at the services, when Will enlightened him as to the cause of this by naively observing: 'Weel, sir, ye see that me and the minister have kept them weel together.'

While Will generally performed his duties efficiently in his own rough-and-ready kind of way, he had some little weaknesses and peccadillos that the minister and the parishioners as a whole were charitable enough to overlook as frequently as possible. At the time of neighbouring fairs, Will's friends were sometimes known to 'treat' him beyond what was good for him, in order to hear some of his quaint stories. At such times the minister took care, if possible, not to require his services. One day, however, when on necessary parochial duty, he chanced to meet Will on his way from the fair, earnestly endeavouring to carry himself as straight as possible. The minister felt bound to tender a mild remonstrance. Will had to stand on his defence, and having just parted with a petty laird, he sought to screen himself by assuring the minister that Jeems Tamson was away up the road 'far fourer than me.' We are bound to admit, in fairness to Will, that such excesses were very rare.

Will's natural-history tastes were somewhat extensive for his opportunities, and on this account he was a great favourite with the manse boys. He had generally about him one or two pets, such as jackdaws, magpies, and squirrels, besides a miscellaneous collection of birds and four-footed animals, which he had stuffed with his own hands. It was more than shrewdly suspected that Will made the acquaintance of some animals with other objects in view than the study of natural history; and that by the aid of a little wire, where the glebe adjoined the Laird's policies, he had occasionally found the wherewithal to make a savoury stew. And before our rivers were so strictly preserved, the salmon-pools had frequent visits from him by torchlight. The success of such visits was amply attested by the fact that Will was able to regale himself with a piece of 'kippered' salmon when others had to content themselves with more homely fare. He in all probability regarded this as a harmless way of supplementing his somewhat limited income. His salary as beadle was by no means an extravagant one; and one year when there happened to be a general rise of wages, he made an application for the modest increase of one pound. In the heritors' minute-books we find it recorded that it was agreed to grant the increase on condition that Will would give up salmon-poaching.

Will remained a bachelor, residing with his old mother, who lived to the age of nearly a hundred years. In mature life he was urged by some of his friends to take a wife. He was very cautious, however, in regard to matrimony, and declined the advice, excusing himself on the ground 'that there are many things you can say to your mither you couldna say to a fremit [stranger] woman.' While beadle, he had seen four or five different ministers in the parish, and had buried two or three of them. And although his feelings became somewhat blunted regarding the sacredness of graves in general,

yet he took a somewhat tender care of the spot where the ministers lay. After his extended experience, he was asked to give his deliberate judgment as to which of them he had liked best. His answer was guarded; he said he did not know, as they were all good men. But being further pressed and asked if he had no preference, after a little thought he again admitted that they were all 'guid men, guid men; but Mr Mathieson's claes fitted me best.'

One of the new incumbents, knowing Will's interest in the clothes, thought that at an early stage he would gain his favour by presenting him with a coat. To make him conscious of the kindly service he was doing, the minister informed him that it was almost new. Will took the garment, examined it with a critical eye, and having thoroughly satisfied himself, pronounced it 'a guid coat, a guid coat,' but pawkily added: 'When Mr Watt the auld minister gied me a coat, he gied me breeks as weel.' The new minister, who was fortunately gifted with a sense of humour, could not do less than complete Will's rig-out from top to toe, and so established himself as a permanent favourite with the beadle.

Although he was naturally of an amiable and kindly disposition, Will would occasionally show that he could assume a self-defensive attitude. When the minister of the parish was unexpectedly called away from home, an afternoon service conducted by a neighbour-clergyman would sometimes be substituted for the regular service. At such times it was Will's duty to apprise the parishioners of this change of the hour of service for the day. On one of these occasions, somewhat to the chagrin of the minister officiating, a very small number of the parishioners were present. With some irritation he accused the beadle of having failed to make due intimation. Will stoutly maintained that he had faithfully fulfilled his duties, by not only naming the hour of meeting, but also announcing the name of the minister who was to conduct the services. Still unsatisfied, fresh doubts were insinuated regarding the veracity of Will's statement, which being more than Will could endure, he quietly informed the minister that if he *would* have the true reason of the small attendance, 'it was that he was not very popular in the parish.'

A meal that Will thoroughly relished and was never in living memory known to miss, was his Sunday dinner at the manse. It was a hearty one, and doubtless served to make up for the homely fare of the Saturday previous and the Monday following. It was a dinner given most ungrudgingly by the minister, who regarded Will as part of the Sabbath household. Moreover, he generally had share of whatever had been on the minister's own table. On one occasion, Will had rather the best of the dinner. The minister's family were from home. A modest steak, intended for the minister, had been prepared by the thrifty housekeeper, and was standing ready on the kitchen-table when the beadle arrived. While the servant was making the necessary arrangements for dinner in the minister's parlour, Will in the interval despatched the steak. When the housewife broke out in indignation, he quietly remarked that he *had* used it under the impression that it was the 'bit bit' prepared for

him. The minister, enjoying the unconscious humour of the situation, first congratulated Will on his good fortune, and then good-humouredly dined on bacon and eggs, which, it may be mentioned, are a never-failing resource in remote country manse.

Poor old Will's step got gradually slower and slower; but nearly to the very last he carried the minister's books up to the pulpit, and with his own peculiar twitch of the rope, made the bell speak out its metallic ding-dong, ding-dong. Even during the few weeks when he was confined to bed, he would show symptoms of keen interest in his duties and reminiscences, when some of his old friends led him to tell again some of his experiences. When the end was visibly approaching, poor Will wondered who would dig his grave. The minister touched his heart by telling him that he would like to do that service for him with his own hands. For as Will always loved his minister, and would bravely stand up for him, whenever any one hinted a querulous or disparaging word, so, like a true-hearted man, the minister loved old Will, and felt that he was losing a true friend. This offer of the last service being the expression of true regard, deeply touched the heart of the failing man, who, after that, seemed content to die. Although the churchyard was very crowded with graves, Will had reserved a spot in which to rest beside his old mother. On his funeral day, the whole parish, young and old, assembled to show their respect for the good old creature.

The church seems now scarcely like itself, since the old quaint form departed from it. He will be long remembered as the last of the parish characters; and kindly feelings will be awakened in many as they read on a simple stone: 'Here lie the Remains of WILLIAM STOUT, who was for Fifty Years Parish Beadle.'

PAPER AND PINE-APPLE FIBRE.

THE variety of purposes which paper can be made to serve is every day increasing. A few of the latest of these are worth mention. It appears that thick paper and cardboard can be rendered as hard and horny as papier-mâché by means of a kind of cement called Chinese Varnish, which is easily prepared from blood, lime, and alum. With four parts of slaked lime and a little alum are mixed three parts of fresh blood well beaten up. The thick flowing mixture that results is, we are informed, at once ready for application to paper or card.

Amongst the curiosities of the late Australian Exhibition is stated to have been a house entirely constructed from paper, containing carpets, curtains, dishes, and what not, all made of the same useful material. Whether the dishes aforesaid were similar to the plates and dishes made in Germany, we cannot say; but in that country, we are informed, platters are being manufactured from sawdust and paper in the following manner: Selected plane shavings are bound into bundles, and steeped in a bath of weak gelatine solution about twenty-four hours, then dried, and cut into suitable lengths. Plates are cut of strong paper or thin pasteboard of the size of the objects to be produced. These are moistened with a liquid

consisting of weak gelatine solution with sodium water-glass, and pressed in heated metallic moulds. After drying, the pressed paper objects are coated on both sides with an adhesive material made of five parts Russian gelatine, and one part thick turpentine; the shavings are applied to them, and the whole is subjected to pressure. (Wood-shavings alone would, because of their unequal thickness, present uneven surfaces.) The objects are now cut, if necessary, dried, and varnished.

In a former number of this *Journal*, mention was made of the dome of an observatory having been constructed of paper compressed to the hardness of wood. If buildings can be satisfactorily roofed with what is usually considered so frail a substance, it is not surprising to learn that hats and umbrellas can be made from the same material, a paper of extraordinary fineness and strength being said to furnish the people in the Corea with both of those useful articles.

Talking of dress equipment, a writer in *The Theatre* mentions having seen in Paris a magnificent stage costume enriched with the loveliest lace he ever beheld. In his own words: 'The dress was displayed on account of that lace; and that lace was worth, perhaps, twenty-five francs; for it was paper, wonderfully stamped, and represented trains of fuchsias, and looked just as much a piece of real lace as a Paris diamond by night looks an old mine gem. Parisian actresses wear that paper-lace a great deal; it is tough, soft, and very effective. To wear a costly lot of lace which may be ruined in a night, when very cheap lace-paper looks as well, is considered the height of folly by intelligent foreigners.'

Other triumphs in the way of utilising paper may safely be predicted. By some enterprising Americans at least, the time is thought not far distant when yachts, lighter, swifter, and stancher than any craft yet built, will astonish the maritime world. Not very long ago, a citizen of the United States made a journey of over two thousand miles in a paper canoe, built for him by a firm in New York. The total weight of the canoe was only fifty-eight pounds; and for strength, durability, and elasticity, could not, they say, be surpassed. The paper-skin, after being water-proofed, was finished with hard varnishes, and then presented a solid and perfectly smooth surface to the action of the water, unbroken by joint, lap, or seam. Unlike wood, it has no grain to be cracked or split; and paper being one of the best non-conductors, boats of this kind appear to be admirably adapted—which cannot be said of steel or iron—for use in all climates. The surface, polished like a coach-panel, never shrinks or absorbs moisture. Once employed by boat-builders, the conclusion naturally suggests itself, that some day a new and hitherto unsuspected meaning may attach to the proverbial phrase of a 'paper-war.'

Propos of our subject, it may not be uninteresting to note that the amount of paper required for the census of last year was stated to have been fifty-seven tons thirteen hundredweight—comprising considerably over seven and a half million householders' schedules, more than seventy-nine thousand enumerating books, and one hundred and ten different forms for vessels.

As regards the raw materials out of which paper is made, the immense commercial importance of cotton and jute as textile products suggests a few

important considerations. Within a comparatively short space of time, these fibres have been the means of founding industries which rank by the side of the time-honoured silk, wool, and linen manufactures. Is it not natural to suppose that if, in scientific matters—notably electricity—we seem almost daily increasing our knowledge, similar progress should be made with respect to those more prosaic subjects which very closely affect the personal and domestic comforts of mankind? Amongst the latter, clothing is, after food, the most essential requirement. The discovery or application, therefore, of a new textile fibre is of much economic importance; and the recently published accounts of the properties of the Ananas (or pine-apple) fibre are sufficient to show that in all probability a very valuable raw material for the manufacture of certain qualities of cloth has been placed within the category of textile vegetable fibres.

The pine-apple is justly esteemed in Europe for its delicious aromatic flavour, and when grown in this part of the world, requires to be kept in hot-houses. In the more sunny regions of the East and West Indies, South America, Mexico, and the Philippine Islands, the pine-apple grows in wild luxuriance. Yet, however widespread its fame as a table-fruit, it is doubtful whether many people know of the plant in connection with the textile fibre it produces. According to one practical authority, the leaves of both the wild and the cultivated kinds yield fibres which, when spun, surpass in strength, fineness, and lustre those obtained from flax. It is further added, that in its manufactured state, this product has been long known as an article of commerce in the countries referred to. One of the leading trade papers of the German textile industry has given attention to the investigation of the properties of this fibre. From India and from Central America, two specimens of tissues woven from it had been received. The former was a piece of striped muslin; and the latter a sample of dress material in which the yarn had been bleached; thus showing that the fibre is capable of undergoing that process successfully. As to the uses to which the fibre can be put, it is asserted that it can be employed as a substitute for silk, and as a material for mixing with wool and cotton. It is likewise stated that for sewing-thread, twist, trimmings, laces, curtains, and the like, its particular qualities render it specially applicable.

As to the extent of its production—which is a primary consideration, from an industrial point of view—it is remarked that the plant in its wild state covers large tracts of land; and that, owing to the absence of suitable machinery for preparing the fibre, the domestic consumption, in the principal countries where it grows, has never increased beyond a point which leaves a large quantity for export. The large size of the leaves gives a great length of fibre, which is an advantage for manufacturing purposes. It has hitherto been mostly used, in the countries referred to, for the making of fishing-nets, lines, &c.; its great strength, and its peculiar quality of not being injured by a prolonged submersion in water, rendering it particularly adapted for such purposes. The fact that every portion of the plant is utilised either as fruit or fibre, has been urged to prove

the lucrative results which may attend its cultivation. In conclusion, the writer considers that the ultimate adoption of the pine-apple fibre as a manufacturing product is assured, and urges on German manufacturers to devote special attention to this new branch of textile industry.

THE LITTLE BRIDGE.

THEY parted on the Little Bridge
Which spans the running water,
The bright-eyed youth with fluent tongue,
And she—the yeoman's daughter.

A few fond words—a stolen kiss,
A little golden trinket,
'Twas all—but that his heart could change
She did not dare to think it.

He journeyed to bright southern lands
Where tropic skies bent o'er him,
And wooed blind Fortune till she cast
A shower of gold before him.

Then Fame took up her trumpet, tuned
To sound his praise in story,
For much that to his life belonged
Was what the world calls glory.

A ribbon marked his high degree,
His name had added letters,
And not on him was any sign
Of life's more galling fetters.

The maiden's path lay towards the north;
She toiled for daily guerdon,
And meekly bore her low estate,
Nor felt her task a burden,

Till 'hope deferred' her spirit broke,
And thorns seemed springing round her,
And thoughts that once were purest joy,
Had only power to wound her.

A poor old maid with fading cheek
Toils on from early morning,
With scanty thanks, and little praise,
And oftentimes heartless scorning.

And yet sometimes she sees the Bridge,
And hears the river flowing,
When memory lifts the shroud of years,
The dead past calmly showing.

And sometimes he, in idle mood,
'Mid silence all unbroken,
Just wonders if the Bridge still stands
Where their last words were spoken.

The Little Bridge still lightly spans
The rippling, running water;
But no bridge spans the gulf 'twixt him
And her—the yeoman's daughter!

PRICE 1½d.

'BY CONTRACT'

ONE of the early results of social organisation is the law of prices. When commodities begin to flow steadily to market, the level of values becomes calculable over a given period. Upon this the system of supply by contract is based. Clearly, if hazard ruled the relations of men to men, it would be impossible to forecast business of any kind. But hazard plays a very small part in human affairs, and even that part diminishes with the progress of civilisation; hence, as the foretelling of the future becomes more warrantable, the contract system extends and reaches new departments of social life. As soon as the demand for a particular article is large enough for an average price thereof to be determined, some shrewd, well-informed man will endeavour to supply it for a given period at a given price. His success depends upon eliminating some unnecessary factor in the series between producer and consumer; and the economy effected is shared between the contractor and his clients.

Everybody knows the railway contractor, who is willing to build an iron road anywhere, of any length, and in any space of time. The world has been metamorphosed by him. By his profound mastery of human powers, mental and bodily, he has enriched mankind in wealth, health, and happiness. Again, the army, the navy, the indigent poor, the sick folks in hospital and workhouse, are fed, clothed, and purveyed for generally, by contract. A vast amount of technical knowledge, of business foresight, of capital and credit, is needed for these giant operations; a small miscalculation might bring irreparable disaster to those engaged in them. Below the magnates are thousands of small contractors, dealing with the public in manifold ways, all showing enterprise, judgment, knowledge, and directive skill of a superior kind. By their ministrations, individuals and families enjoy the benefits of a completer civilisation than they could if served otherwise; saving money, time, and trouble in a considerable degree.

As a specimen of the odd ways in which this mania for contract manifests itself, it may be mentioned that there are tailors who contract at a moderate fixed tariff for clothes to be used only for a stipulated time and then returned. Four times a year, or oftener if you like to pay more, a box arrives at your address containing the suit adapted for the particular season, perfect in fit, perfect in fashion. In the same box you return the clothes just worn, untroubled by any negotiation with those unconscionable depreciators of value, the 'old-clo' men. Again, the glittering equipages dashing by the modest pedestrian, and bestowing upon him arrogantly-flung mud, are not always owned by the supercilious persons lolling at ease. Sometimes the modest coachman is the proprietor of all the impressive bravery; and those in the places of honour have no more claim to the stately chariot than the 'shilling fare' has to the hansom cab.

The contracting job-master is indeed one of the wonderful race who diminish the friction of society by making things easy. His enterprise gives brilliance to the parks, in prancing steeds, gorgeous coaches, elegant phaetons, and all the items of equine and vehicular movement. He is ready to make a contract for carrying the whole of the *beau-monde* on undeniably favourable terms, and also to supply it with retinues worthy of a Prince of the Blood. He is capable of humble services equally with the grandest. He will furnish an undemonstrative Quaker with the most homely of broughams, horsed by the mildest thing on four legs, and driven by a man whose solemnity of aspect, taciturnity, and disrelish for intoxicants add a finish to the turn-out beyond compare.

The Metropolitan job-master is only one of the numerous contractors for the use of horse-flesh. Hundreds of provincial gentlemen have their stables furnished at so much a year. Those who have had much to do with horses, know the risks and annoyances connected with purchase and sale. In spite of 'warrants,' veterinary advisers, subtle grooms, and the whole preservative host surrounding

the buyer, he may spend a hundred guineas upon an animal that is not worth the half of that sum when it comes to be employed. The horse-contractor abolishes all the plagues besetting an owner, and leaves us free to enjoy our gallops, drives, and pageantry without a trace of equine care. Further, a contractor can supply the most perfect matches for 'pairs,' in colour, style, and action. His guarantee for the temper, pace, and performance of saddle-horses may be accepted, so that a timid or awkward rider can enjoy equestrian exercise without fear. But not the least advantage of hired, or as they are usually termed jobbed, horses is that no capital is locked up by the hirer in a dubious investment.

Another useful contractor is appearing upon the scene—the family physician, who for a fixed stipend visits the household at stated intervals. Daily, bi-weekly, or weekly, a medical guardian will attend us, not simply to cure our fleshly ills, but to prevent them altogether. The vast progress in hygiene and sanitary science suggests a new departure in the popular estimation of health. The strongest of us have some little weakness in the bodily machine, some inadequacy of mental force; it is for medical guardians to deal with these after the most business-like fashion, and, so far as Nature permits of amelioration, to make our constitutions better than they were originally. This the Esculapian contractors do not hesitate in attempting. All good citizens contract with life-assurance Companies that their survivors may have financial consolation for their loss; and to contract for a long continuance of life itself, and life of the most effective and delightful kind, is surely of equal importance, though somewhat of a novelty.

Many people now make yearly contracts with their dentist. One effect of extended physiologic knowledge is a greater care for the teeth. The importance of maintaining them sound and handsome is admitted by all. Owing to the ravages civilisation has made in our dental possessions, few persons are untroubled by them. A great art and important industry has arisen, and the dentist is a power in the land. But many sufferers find it better to employ him preventively, than curatively to obtain his highest services. There is much in favour of this system which foreshadows a great and salutary improvement in individual welfare. What would sufferers *not* give to the dentist who could keep them free from toothache and preserve their teeth brilliant and useful to old age?

Some hotel-keepers and restaurateurs are beginning to contract for the supply of a certain number of meals, the tariff varying with the quantity. For instance, one can have twenty dinners for so much, fifty for proportionately less, and be dined every day in the year for proportionately less still. This system is much in vogue in France; and its advantages are so obvious to hosts and guests, that it should be

successful in all our commercial towns. It is only a development of the 'ordinaries' of market towns, where a host, depending upon a certain number of diners, is able to cater generously in proportion to the number of his guests. In every business place, a co-ordinated scheme between purveyors and eaters would result in an immense saving to both, and thereby to the community.

In London and other large cities, there are gardeners and florists who contract for the supply of plants and flowers for the year round or for the season. By their aid, and at small expense, the house and garden-plot can be made charming with all that the floral world can afford. Nor need we ever want a piano or fail to have our drawing-rooms resplendent, our dining-rooms fairy-like, the family gratified, and guests delighted, for a comparatively small charge. Some people have a fancy for changing their household furniture, and love to follow fashion in upholstery as they do in clothes. They have created a number of contractors to minister to their desires. At no great cost, boudoirs and reception-rooms can be furnished with the last thing in chairs, couches, cabinets, mirrors, ornaments, and the whole detail of things useful and unuseful.

Railway Companies are ready to contract with individuals or parties for transport over a given distance; and indeed a very large part of their business is conducted on this method. Millions of mercantile men are carried from suburban homes to town and back daily, to the great benefit of themselves and the Companies. But the system is capable of large extension. Were rates lowered to meet the wages of the working-classes, and were the services accelerated, immense numbers would reside in the country and remoter suburbs, who are now imprisoned in towns. The cost of running five hundred people to business and back would be very small to the Company, who could thus place their resources at the convenience of the humblest. Railway Companies might enormously increase their Third Class traffic.

Since the use of bicycles and tricycles has so largely increased, a number of contractors for the supply of them have appeared. Youngsters who cannot afford to spend fifteen or twenty pounds upon a machine, can rent one on moderate terms; and those who object to the cost of keeping them in repair, may now negotiate to have their 'flying wheel' always in perfect order for a small quarterly payment.

The system of sub-contracts has been much increased in recent years. It pervades most complicated businesses, but is almost universal in the building trades. With the stagnation of the latter, which has been the rule in most places, contracts have been refined to the extreme. Single workmen have contracted with employers for a particular detail of a house or building.

In Paris, an Association has been formed

which contracts to maintain houses and every description of building in perfect repair at a fixed annual charge. It is called the *Compagnie de Bâtimens*. Property owners in England would be glad of the services of a similar institution, and there is no doubt such will appear eventually. The destructiveness of the weather is more serious than that of fire. Not one building in a hundred is burned, but every building is incessantly being injured by the atmosphere; and often workmen are careless when they are sent to repair roofs and drains.

Gas Companies contract to furnish us with light. In New York, a powerful Company is now laying down pipes to supply heat to a large district. From a centre, steam will be sent by mains, and these will communicate with small pipes laid into houses and shops; and the Company is prepared to contract for the maintenance of any temperature that the users please. A system like this is particularly available for cities like Paris, Berlin, and Vienna, where large numbers of people inhabit one tenement, and where the cost of fuel is high.

The extraordinary progress of electrical science, and its application to domestic purposes, will bring in a new species of contractors, whose ministrations promise to revolutionise our homes. Light, heat, and motors are now on offer by several Companies, and at rates that almost compel their acceptance.

As the economical education of the masses advances, great progress in the contract system will follow. The many will perceive the utility of co-operation, where few now see it. The army of intermediaries that operate between producers and consumers, has been created by the necessities of a rudimentary civilisation.

The contract system has many aspects, but its effect is always the same. It prevails under numerous forms in almost all the major departments of trade. Produce of every description is sold by contract at certain dates. Manufactures are also disposed of in the same manner. Of course, there are vast transactions for immediate delivery and at the market rates; but the characteristic of modern commerce is sale of 'futures.' It would be impossible to conduct the giant trades in cotton, corn, wool, iron, &c., in small day-to-day transactions. Merchants and manufacturers are obliged to look ahead, and this brings in contracts. Upon the price of the raw material he will receive in the autumn, the cotton-spinner makes a contract to sell yarn; and the cloth-maker his subsequent contract for calico delivery. The food we eat, the clothes we wear, the houses we live in, have all been contracted for many times over. Cheapness and abundance have followed in the wake of the great controllers of supply; and the ease and certainty of modern purveyance have grown with the development of the contract system. By it, society goes along as by clockwork, each day making it more accurate. By degrees, all superfluous details in the mechanism are put aside, to the improvement of regularity and the diminution of cost.

Reduced to ultimate financial terms, the contract system means the massing of many credits together. The public and a contractor agree to purchase a certain quantity of a commodity at a stated time. This brings all concerned into

definite relationships. Demand and supply are exactly balanced; loss and waste are avoided. The resulting economy is the profit enjoyed by the contractor and his customers.

VALENTINE STRANGE

A STORY OF THE PRIMROSE WAY.

CHAPTER XXXI.—ALL DAY, HIRAM LOOKED ABOUT FOR CHANCES, AND NEXT MORNING HE SET OUT AFOOT IN PURSUIT OF EMPLOYMENT.

'MR SEARCH,' said that official of the Omnibus Company who controlled Hiram's destinies, 'after to-day, your services will not be required.'

'Oh?' said Hiram. 'I reckon I've got a right to ask what that's for.'

'You have twice appointed a substitute without leave, and you were yesterday two hours absent from your post without even appointing a substitute. The driver tells me that the block in Cheapside was your fault, and yours only.'

'He's maybe right, mister,' responded the conductor. 'But it won't happen again.'

'I'll take care of that,' said the official person.

'It'll suit me better to hold on awhile,' said Hiram, 'if you don't mind. It's rather an awkward corner to get throwed off at, this is. Give me another trial.'

'We shall not require your services after to-day,' repeated the official drily.

'Then I must try to get along without you,' responded Hiram. 'Bus-conducting ain't half such a berth as the Prince of Wales's, is it?'

'It's a pity,' said the official, shaking his head at Hiram, a little mollified by the discharge of his own thunderbolt, 'that you don't stick at your work, Search. You're a smart fellow, and a sober fellow; and if you'd only stick, you'd do.'

'There was a minister had a nigger once, mister,' returned Hiram, 'and whenever he misbehaved, the parson used to cowhide him. And while he cowed, he'd take a text and preach, just so as Peter shouldn't find the thing monotonous. One day, Peter turns round and kind o' makes an appeal. "If you flog, flog," says he; "and if you preach, preach; but don't flog and preach too at the same time."'

'O yes,' said the official, shaking his head again at Hiram with a humorous aspect; 'I know that yarn. I've heard it before, Search—I've heard it before.'

'Well, now,' said Hiram, with a propitiatory twinkle in his eye, 'I go with Peter. Don't give me the sack and lecture me. Look here! You take the sack back again, and lecture me till I'm good. It won't take long.'

'No, Search, no,' returned the unbending official. 'It can't be overlooked. Here's my last word: if you like to come back in a week's time, I'll give you another chance—perhaps.' There-with he turned and left the delinquent.

'That won't do,' said Hiram, addressing himself emphatically. 'There's a chance a minute opening somewhere. I can't afford to wait a week for one. There's the little gell to be provided for. It's kind of you to offer me a holiday, mister, but I can't stop to take it. Here goes the hull population of this planet hotfoot, full tilt, running fit to split from dawn to sunset

every day, after the day's rations, with some exalted parties looking on serene and smilin' at the racket—Dukes, and a Prince or tew; but it's no use for me to sit down alongside the superior human article. Perhaps I could smile at the racket as pretty as any of 'em; but that wouldn't find me two days' rations every day; and I must run with the ruck, I reckon, and kick and elber right and left, and run cunning. Very well, then.—Bank, ma'am! Whitechapel, mister! This way for the Bank. Reg'lar load o' capitalists to-day. Get along!

All day, Hiram looked about for chances, and next morning he set out afoot in pursuit of employment. After many intricate wanderings, many inquiries, and as many rebuffs, he came, in a retired tumble-down square midway between Fleet Street and Holborn, upon an announcement that compositors were wanted. Anything dingier than the dingy placard which bade Hiram inquire within, anything dirtier than the windows, anything filthier and more rickety than the stairs, he had not seen in London. Upon one landing, a barrel of printer's ink had leaked, and having trodden upon the sticky mass, he ploughed his way up-stairs as a fly goes over that humane invention the 'catch-'em-alive.' An exaggerated smell of damp newspaper—the distinctive odour which attaches to an ill-ventilated printing office—saluted the applicant's nostrils; and a hot blast of air, such as a furnace might be supposed to breathe if its digestive apparatus were thoroughly diseased, swept at him as he opened a swinging door at the head of the stairs. Right and left at double frames, pale men and weedy lads faced each other, picking up types as if for bare life. In the streets, the spring-sunshine had been bright; but here, above every double frame hung a cob-webbed gas-bracket, patched with pasted paper here and there, to cure the leakage of gas, which nevertheless smelt horribly; and from each bracket sprang two flaring lights, with flimsy sheets of green paper hung before them on a contrivance of wire, to shelter the worker's eyes from the glare. No man or boy looked up from his work to remark the new-comer; but after an uncertain pause of perhaps a minute, a sallow, melancholy-looking man in a ragged frock-coat and a soiled apron, appeared at another door, and approaching Hiram, asked his business.

'You want compositors?' asked Hiram.

'Yes,' said the other.

'I want work.'

'Very well,' said the melancholy-looking man; 'you can begin at once, if you like.' He led the way to a frame on which reposed a pair of empty cases. 'All this matter is for distribution. It's all minion, and all one fount.' Saying this, he pointed to a galley-rack on which rested many columns of half-washed type, and betook himself to the other end of the room.

'Say,' said Hiram to a pale and long-drawn lad at the next case, 'is there a sink here anywhere?'—The lad nodded his head sideways, and went on with his work.—Hiram lifted a galley and carried it to the sink, and having washed the type thoroughly, took up a handful and began to throw it into the case. His fingers had lost the feel of custom, and he was awkward at first; but he recovered the art by-and-by,

and went ahead at a great rate. 'Work pretty regular here?' he asked his neighbour.

'Yes,' said he, nodding vigorously at the case and working head and shoulders with unnecessary ardour.

'Piece or 'stab?' inquired Hiram laconically. The inquiry being translated meant: 'Are we paid by results, or at a settled rate?' 'Stab is compositors' English for established, and is even, by that system of compression in vogue amongst them, made to signify a certain fixed wage. In their working hours, compositors are the most taciturn of all working-people.

'Haven't you asked?' inquired the youth, turning his eyes on Hiram for the first time.

'No,' said Hiram. The pale lad having once looked at him, seemed determined to see as much of him as he conveniently could at one eyeful. The new-comer had turned back the cuffs of his shirt over coat sleeves of new black cloth; and the cuffs were white, and were, as their position proved, actually attached to an under garment. Hiram's collar, presumably belonging to the same garment, was spotless; his boots were well made and new. His well-brushed glossy stove-pipe hat hung on a peg behind him. The pale lad gaped at this show of respectability.

'I don't fancy you are one of our sort,' he said meekly.

'No?' said Hiram, rattling the type into the boxes, growing pretty full by this time. 'Why?'

'It's a turn-over house,' returned the lad. 'We're all improvers here.'

'That's a moral blessing in its way,' responded Hiram, to whom the lad's phrases bore no meaning. 'Ain't it, now?'

The pale youth smiled drearily in answer to Hiram's glance. 'We're turn-over apprentices,' he explained. 'We've never served our time, and we don't belong to the Union; so we only get paid half-rates.'

'What's that?' said Hiram.

'Why,' said the lad, 'it's sevenpence-halfpenny a thousand for minion. That's the regular pay. They give us threepence three-farthings here. At the end of the week, you put in a bill at full prices, and they halve it. Suppose you put in a bill for two pounds, you'll get a sovereign.'

Hiram gave vent to a long faint whistle, and having at that moment cleared his hand, walked over to the melancholy-looking man in the soiled apron.

'Look here, mister,' said he; and repeated the lad's statement. 'Is that so?'—The melancholy man in the soiled apron said it was.—'So,' said Hiram, 'you reckon on half-starving this mean crowd, as an indocement to them to cut the throat of the trade they starve by.'—The melancholy man said he might put it that way if he liked.—'Well,' responded Hiram, 'when a man's hard up, he gets into singular company. You don't seem to thrive, and there's a kind of saddened aspect about the hull kyhoot. I don't make one of this ragged regiment, mister. No, sir; I do not. I am not afraid of work. I could always beard Employment in his den and Labour in his hall! But my intellec,' added Hiram, with a gracious smile, 'is not yet sufficiently overcooked to permit me to jine in with this peculiar enterprise.—Good afternoon, sir.'

'I thought it wouldn't suit you,' said the pale youth who had given Hiram the character of the place. 'They ain't a high-spirited lot as comes here.' He rubbed his nose with the back of his composing-stick as he made this reflection, and cast a longing look at the case of type which Hiram had left partly filled. His own one was almost empty.

'You can take that,' said Hiram, adjusting his cuffs and reaching for his hat. The lad thanked him, and changed the position of the cases; and Hiram departed, without being noticed much by anybody. 'An hour and a half wasted,' he thought as he went down the littered ink stairs and emerged upon the streets again. 'I'm game to run as cunning as I can,' said Hiram, drawing a long breath of purer air; 'but I'll do nothing to be ashamed of. Me and my little gell can starve, without cutting other people's throats to be allowed to do it.'

For the first time since that adventurous summer day on which he had met Gerard Lumby, the sun went down without his having earned a halfpenny. This reflection saddened him, and he went home footsore and weary. Sitting alone, and smoking a pipe over the ashes of the fire which had that morning boiled his tea and cooked his rasher of bacon, he resolved on a house-to-house visitation through the business realms of London, in search of employment. The stupendous nature of that inquisition half frightened him at first; but on reflection, he adopted the method as being, after all, the only practicable one. 'I can't advertise,' he said between the whiffs of his pipe, 'because I haven't got the money; and if I had, what could I advertise for? "TO THE GENERAL PUBLIC.—A YOUNG MAN who knows his way about, and has travelled, is open to employment as Clerk, Scenic Artist, Newspaper Editor, Chair-mender, Compositor, Architect, or Sandwich-man. Berth in clothes-store good enough to begin with. No reasonable offer refused. Open to negotiate with Bill-stickers, Railway Companies, Members of Parliament, and the Public generally."—They'd laff at that,' said Hiram with a dreary sadness. 'In this effete old empire, a man seems to think he's done his duty if he's learned enough of one craft to help him to cheat somebody into believing that he can work at it. They bind him 'prentice to learn bricklayin'; and if he's got a head on him at all, he knows all they can teach him in as many days as they make him spend years. They reckon on taking seven years to teach a man to stick types on end, and they won't let him earn a living at it till that seven years is wasted. I'm a fairish smith, and I'm a decent wheelwright, and there ain't a better cabinet-maker in London; but because I haven't wasted seven years apiece in learning to use hammer, spokeshave, and chisel, I'm a trade pariah. That's what's the matter with me—I'm a trade pariah. And I call it too cruel ridiculous, that because I'm smarter than ten of these fellers put together, I'm offered half-wages.' He knocked the ashes from his pipe, and laid it down on the hob tenderly. It was the identical pipe he had vainly striven to light in the lane ten miles from Brierham, and he had an affection for it. 'No,' he continued, half aloud; 'I can't advertise; and what's the

good of answering? I suppose I can't have spent less than two pound at that since I've been in London; and I never had so much as one reply. There was that clerkship I went for personally. Shall I ever forget it? A street-full of respectable applicants, and every man-Jack of 'em with testimonials enough to fill a butcher's basket. I shall get slanged a good deal on this journey; I shall be a decided noosance to a heap of Christian people. But where there's an advertisement, I'm one of five hundred; and here at least I *shall* have a chance of lighting on somebody who wants me, and hasn't had time to advertise for me and bring the other four hundred and ninety-nine cavorting around. It's the other four hundred and ninety-nine that spoils things. Five hundred rats, and only one wanted to take charge of the candle-store. Five hundred redskins, and one white scalp. Five hundred frying-pans, and only one fire.' A mere moonbeam of a smile illumined his long countenance. 'I am becomin' figgerative,' he said, 'and that says: "Lively, Hiram."—You'd like another fill, wouldn't you?' apostrophising his pipe. 'You look hungry. You shall have it.' He filled his pipe again, and having lit it, began slowly to undress. This was his first night in new lodgings. Mary was disposed of for the time being; and it had been determined between them that she should try on the morrow to recover her old situation. They were going to get married, for pure economy's sake, so soon as that became practicable. The depressing influence which attaches to new places was upon him. He was and had been for years a wanderer, and yet he felt it for once, keenly. There are some who never quite master that depression. I have but once spent an unbroken three months under one roof since I was three-and-twenty, and yet a new abode is always dismal for the first half-hour. The tables are unfriendly; the chairs have a stand-off air; the grave voice of the clock is the voice of a stranger; and the very fire shows new faces.

It is not necessary that a man should have been bred like Bayard to be as chivalrous as he; and Hiram, sitting in his shirt-sleeves on the bedside, and pulling solemnly and slowly at the well-blacked clay, was as full of manly tenderness and stout resolve as he could hold. 'It makes a man sort of fearful and thin-skinned to have a gell to look after,' soliloquised our philosophic hero. 'Can't help thinking what she'd do if I broke down. This city gets a man under, too.—Hiram! Mister Search! Think of what depends on you, and hold your head up and step out firm. That's better. Now, then; into bed you go. Pleasant dreams, Hiram.—Good-night, darlin'. Sleep, my dear little gell, sleep! sleep, and forget your troubles. If I was a cherub, you shouldn't hurt for want of watching.' And Hiram, fairly worn, blew out his candle, laid down the well-blacked clay gingerly on the floor, turned over, and, not unmindful of his Maker, fell asleep.

He was out early in the morning, and began his round. Busy people declined to waste a moment on him. Others with more leisure questioned him, and sent him on again. Some were civil, some were not. It made no difference

to him; he went out at one door and in at another, and ran through his formula with unflinching pluck and cheerfulness. That went on all day from nine in the morning until seven in the evening, and nothing came of it but weariness. He crept home footsore and with a little failing at the heart. If you have 'No' thrown at your head three hundred times running in a single day, you are likely to grow disheartened. Next morning, he began again, and prosecuted his weary task till noon. That frozen monosyllable barred every door with a barrier like ice, until at last he came upon a restaurateur in a little street off the Strand, who offered him a berth as a waiter on condition that he made a deposit of two pounds and gave a satisfactory reference. He gave a reference to the official who had dismissed him, went home and pawned everything but one suit of clothes and his linen, raised the money; and on the following day entered on his new business.

He was not in an exalted sphere of life; but it began in a very short time to pay better than omnibus-conducting. The restaurant was not long opened, and was by no means a high-class concern; but it began in its own way to thrive, and Hiram thrived with it. It was in the man's nature to take a pride in whatever he did; and before he had been in the new line a fortnight, he performed conjuring tricks with knives, forks, and plates that were wonderful to look at. Like the proverbial good actor, who lives his part, Hiram threw himself head and heels into the character; and as soon as the funds would allow it, he blossomed forth in an evening suit and a stiff white necktie. The proprietor rallied him a little, and the regular customers chaffed him mildly, on this butterfly leap from the chrysalis garb. He smiled blandly, and the owner of the place began to think he had picked up a jewel. Hiram, as the business of the place improved, received something considerable in the way of tips, and began once more to lay-by money. Then out came from his fictionary uncle's care, Gerard's half-sovereign, and this being drilled, was suspended to the watch-chain which once again hung across Hiram's waistcoat.

He had scarce been invested more than a month, when one day a young gentleman entered sadly, and seating himself, called for a chop and a pint of bitter beer. From the moment of his entry, Hiram fixed his gaze upon him, and when he sat down, walked to his side and awaited his order with a countenance of many emotions. When the order, given with bent head, came to Hiram's ears, his face changed ludicrously. He passed on the demand for the chop with a private signal to the cook to do his best; and having set the pint measure beside the new-comer, he rattled about with knives and forks and water-bottle, keeping a corner of his eye on the guest meanwhile. If his object was to induce him to raise his head, it failed; but when he brought the chop, he succeeded in getting a near look at the stranger's face. There was no other customer there at the moment; and Hiram watched him with a look of evident pity and amazement. The stranger ate his simple meal, and paid for it, and went his way without a glance at the waiter who found him so deeply interesting. Being left to his own devices, Hiram took up a

copy of *The Times* and turned to the advertising columns.

'Yes,' he said under his breath; 'there's no mistake. Eh, dear, now! "Lumby Hall," he read, "ten miles from Brierham, four from Colham, five from Dene." That's where I saw him first and last. Great smash in the City. Supposed gigantic frauds by Mr Garling. Lumby and Lumby. Same name. Comes from same part of the country. Could afford to chuck half-sovereigns about in them days. Come down to taking his meals in a shanty like this. And the man that's ruined him is the father of my little gell. Eh, dear!' And Hiram sighed most piteously, and sat for ten minutes in tragic amaze, until an order for broiled kidneys awoke him from his stupor.

It was indeed Gerard Lumby whom Hiram Search had seen; but Hiram, though he guessed rightly in most respects, had somewhat overleaped the truth in his belief that Gerard was yet so poor that a few pence spent upon luncheon made a difference to him. Amongst his friends—and this episode, since it led to nothing but his meeting with Hiram, may briefly here be mentioned and dismissed—was one who had been a fellow of his college, and now, having married, and thereby resigned his fellowship, had associated himself with a daily journal. There was then, as usual, a disturbance in the East of Europe, the unspeakable Turk and the equally unspeakable Christian of those parts being occupied in recriminatory raids and murders; and Gerard's friend sought him out when he heard of the failure of the firm, and offered him employment as a special correspondent. Gerard leaped at this proposal; and it was to discuss it, that he had come into the street in which the new restaurant was situate. The newspaper offices were only half-a-dozen doors below, on the same side.

The business not having come to a head between the Eastern unspeakables, the journey Gerard meditated was delayed; but he went to the offices daily, and almost daily lunched at the new restaurant. In the simplicity of his mind, Hiram imagined that this was the principal, perhaps the only meal of the young man's day. To suit his fallen fortunes, poor Gerard had sold all his jewellery, and he had become neglectful of his dress. He was not slovenly, but the old precision and nicety had vanished. In the old days, he had carried his head a thought too proudly. He hung it now habitually, and his face was pale. It was no wonder, for his heart was alternate frost and fire; and what with his father's loss of all manly faculty, and his mother's grief, and his own loss of love and fortune all at one fell swoop, such cankering miseries gnawed the poor fellow's soul as were almost too much for humanity to bear. Hiram began to see him daily, with here and there the pause of a day between. To Hiram's imagination, Gerard's occasional absences meant—no dinner. The tough-tender Yankee began to yearn over him and to sorrow for him. He was too delicate—in a word, he was too much a gentleman—to claim acquaintance with his benefactor in these days of fallen fortune; but one day, when Gerard—after a two days' absence this time—took his usual chop and drank water instead of beer for some no-reason, and neglected

to leave behind him the twopence with which he had commonly rewarded the waiter's service, Hiram leaped farther along the mistaken road, and jumped to the conclusion that Mr Gerard Lumby and actual famine were beginning to make acquaintance with each other. So, begging and obtaining an hour's leave of absence, the mistaken one slipped out after Gerard, and dogged him home to chambers in the Temple, where he was staying with an old college chum now called to the bar. Hiram saw him enter by means of a latch-key, and went back again. But that night he wrote upon a little bit of writing-paper in a clerkly hand these singular words: 'From a true and grateful friend, who remembers a kindness.' He folded up in the paper a half-crown, and—dropped it into the letter-box, addressed to Gerard Lumby, Esq.

Gerard dined, or lunched, more plenteously next day, and took cheese. Hiram served him almost with tears in his eyes, and that night dropped another half-crown into the letter-box ticketed: 'From the same.' To Gerard's sore heart, these well-intentioned but unnecessary gifts were bitter and enraging, and he asked himself again and again who the base enemy could be who chose so cruel a method of humiliating him in his misery. Sitting in his friend's rooms alone that night, with his own aching thoughts for company, he heard a stealthy footstep ascend the stair. Wrathfully expectant, he arose, drew back the latch of the door, and waited. The third package dropped by the unknown hand fell with a dull little clang into the letter-box. Gerard dashed the door open, and seized a dark retreating figure.

'Come in,' he said, in low tones that boded no good to the captive. 'Let me have a look at you.' The lithe Hiram struggled like an eel; but the vice-like grip only tightened on him; and strong as the Yankee was, the athletic Briton walked him into the room and had him hatless under the gaslight, whilst you could say 'Jack Robinson.'

THREE DAYS IN BRITTANY.

THE train passes through the depths of the forest of Crannon. So thick is the foliage that the branches of the oaks and elms brush against the windows. My friend Davis and I are travelling through Brittany to Cape Finisterre, where lies the little town of Douarnenez. Our eyes catch a glimpse here and there of a moss-grown Druidical stone, an encampment of charcoal-burners, or a hastily retreating rabbit. The forest is passed, and we are crossing a moorland covered with gray rocks. From this high ground we distinguish the indentations of the coast around the harbour of Brest; the sea sparkles in the sun, and to the left is the undulating blue line of the Montagnes Noires. Viaducts are thrown over deep valleys, solitary and savage; beneath, streamlets wind through green meadows, where the small black cows of the country are grazing. There is a melancholy joined to tenderness in these *landes*, or moors, the cause of the home-sickness which the inhabitants feel when they leave

them for a time. We are in the wild country of Ar-mor, with its Breton poetry, its solitary manor-houses, its hamlets shaded by trees, and the perfume of the oak forests and the sea.

A long steep street, badly paved, lined with poor shops and blackened façades—such is Douarnenez. A square, where congregate groups of sailors, servants, and peasants, and in the middle of which stands a fountain, cuts the high street in two; and to the right and left, crossing like the meshes of a net, are small outlets, exhaling a penetrating odour of bad fish. We seek our hotel, and find it is a resort for artists, who are just returning for dinner; the men with gaiters up to the knee, a long pole in their hands, and stooping under the weight of their easels. The ladies, dressed in plaids, with hair flying, and limp petticoats, are escorted by boys, who carry their colour-boxes. Pleasant talk beguiles the dinner-hour; and then we find that in the large room belonging to the hotel there is a marriage festival going on, and thither we adjourn.

The young people here all get married, we are told, though the girls in every family are numerous. All are workers. From the earliest age, the crochet-hook or knitting-needle is put into their hands, and they wander on the seashore counting their stitches. At fifteen the poorest go to the *friturerie*, where the sardines are preserved. It is amusing to watch them when they become *sardinieres*, alert and sharp, ready with their saucy replies. They walk down the street at noon in files of five or six, their wooden shoes sounding on the uneven pavement, and gazing at strangers with bursts of laughter. The daughters of the next class work as embroiderers of shawls, or the frontals of altars, and execute flower-garlands on muslin or crape of an astonishing and very original colour. Every one is busy, and wants for nothing. Our hostess, who is a buxom figure, has ten children, five of whom are daughters. Three of these are already married; and the other two, slender and fair, are dancing at the party to-night.

On these occasions, the girls empty their savings-boxes for their adornment. In this long whitewashed room there is a display of toilets such as have rarely been seen. The girls are in white dresses, with muslin or China-crape embroidered shawls. The picturesque cap is of light lace, made up with something like a horn at the back of the head. The white dresses are relieved by silk aprons, with bibs of the most delicate colours—pale blue, sea-green, lilac, and gray mingling with charming grace. We especially noticed one young recently married woman, for the almost eastern luxury of her toilet. A dress of white satin, rose-coloured stockings, ribbon of the same colour round her waist, trimmings embroidered with roses, a muslin shawl and apron, lace head-dress, and silver ornaments. She was pretty as well, with a delicate complexion and fine brown eyes.

The men are much less conspicuous. Their coats are of a very sombre hue, and they wear broad-brimmed hats. The two violinists who formed the orchestra played the old air of the *brante*. The dancers took each other by the hand in files of twelve, and executed a dance of the country known as the *gavotte*. Each file, led by a man, gravely described half-circles in

the form of the letter S. All these garlands of men and women move lightly, crossing, turning, gliding adroitly around each other, and never departing from the most ceremonious gravity. In this country, manners and customs are deeply rooted; nothing has changed; they dance as they did in the days of Louis XIV.

The next day is that of the yearly regatta—a holiday for this little town, where the population live on the sea. The sardine constitutes the riches of Douarnenez. In the days of the Romans they would have consecrated a temple to it; now they are content to carve its image in front of the churches. It reaches this coast in the month of May; from that time to December, eight hundred boats are employed in the sardine fishery, and if the season be good, catch many thousands of fish daily. At the hour of departure, the port presents an animated spectacle. Down the numerous flights of steps the men arrive, carrying their baskets, and wearing cowls of oiled yellow cotton. Their wives, knitting in hand, accompany them to the beach. Provisions, nets, and bait are laid in the bottom of the boat, where each crew consists of a captain, two rowers, two or three fishermen, and a boy. The pulleys creak; the sail is run up; the boats double the point of the jetty; and an hour after, the whole flotilla is out on the sea, and looking no bigger than a flight of swallows.

During the fishing, profound silence is observed. The captain throws out the long net to right and left. The bait, or *rogne*, is composed of the roe of the cod steeped in sea-water. The sardine rushes upon it, and is caught in the meshes, where its silvery scales sparkle. When the net sinks with the weight, two men raise it, and shake it adroitly into the boat, so that the fish falls without being touched—a condition indispensable to its good preservation. When the boats return, the curers who want to buy hoist a flag on the rocks; the captains reply with other well-known signals, and the bargain is concluded before the port is reached.

To-day, the fête has drawn all the multitude to the port. The chances of each boat in the race are eagerly discussed. Compact groups of men and women, peasants and citizens, station themselves round the *mât de cocagne*, or before the orchestra, where the drums are beating their loudest. All the costumes of Brittany are represented—large round hats with velvet ribbon streamers mingle with the muslin *coiffes* of the *sardinières*, or the gophered frills of Quimper, the hood-like collars of Chateaulin, or the white-winged caps of Concarneau. Here and there, a man shows his numerous waistcoats embroidered with bright-coloured wools. The women display an oriental love for colour, large yellow or scarlet bodices, sleeves braided with silver, green petticoats bordered with gay flowers. Among them, the children swarm, the girls dressed like little women; the boys covering their fair, curly hair with a blue cap, and showing the bronze skin through the holes of the waistcoat or trousers; bold, quarrelsome, ragged, but handsome, fresh, smiling, with the agility of squirrels, large blue eyes, and rosy cheeks.

Some of these juveniles give themselves up to a game which is dangerous, though lucrative. On board one of the ships, a sail-yard attached

to a mast hangs horizontally over the sea; to this are tied red belts, waistcoats, and cravats. Some urchins astride, others standing on the well-soaped spar, advance slowly to the yard-arm. One turns round half-way; *plouf!* he has fallen into the water; but diving, he reappears at the side of the ship. Another reaches the extremity, chooses a fine red belt, shakes it with an air of triumph, seizes it between his teeth, and plunges head-foremost into the water. In half an hour the yard-arm is bare. But the *gamins* are not tired; they dive for sous, wrapped in white paper, thrown by the spectators, and fight under water for the possession of them. One carries on the game for half an hour, swimming like a frog; he never rests, his eyes starting out of his head, and secreting his coins in one corner of his mouth, crying, 'Have you no more?'

The brass band calls the crowd to the end of the jetty, for the boats have returned, amid loud cries of encouragement, clapping of hands, and altercations as to the winner. We leave the port, and visit the field where they are dancing. Two musicians in Breton costume, long hair, and droll countenances, are perched on a platform, playing on the bagpipes with great energy. At their feet, the sailors and peasants are executing a kind of *gavotte* with great gravity to a monotonous tune. The girls form a circle round them, but do not mingle in the dance; and so the day closes.

The next morning, some acquaintances at the hotel join us, and we hire an omnibus to take us to the Pointe du Raz. The road is steep, till it reaches the high plateaux of the *landes*. The tower of the church of Pont-Croix rises through the trees, and at length we reach Audierne, a dirty, dull, fishing-village. As we advance, the road becomes more arid, the country bare and uninhabited. Trees are rare, so also are houses. As we mount upwards under the hot sun, the blue waves of the bay sparkling like so many diamonds, the corn disappears, to give place to rushes. At Lescoff, the last village before reaching the Pointe, some women are spinning with the distaff outside their huts. We ask them some questions; but they look at us with a frightened air, and disappear quickly under the black porches of their ruinous homes. Numbers of ragged children follow our carriage. Now to the right as well as to the left we see the bright sea, and in the middle of the red heather rises the white tower of the lighthouse. The great voice of the ocean is the only sound, and here are the formidable gray crags of the rocks at Raz, before which the lighthouse stands like a mysterious sentinel. One of the keepers offers to be our guide, for the path is somewhat dangerous. The land recedes from our view; fine pointed rocks are heaped obliquely on one another, leaving but a narrow border of turf between them and the abyss which opens beneath our feet. We advance in Indian file; and to increase our difficulty, the children, naked or ragged, rush in between our feet, climb the rocks like monkeys, and offer us bouquets of fern for a few sous.

All round, an immense space of sea dazzles our eyes. To the left is the extended semicircle bounded by the misty rocks of Pen-March, and the Bay of Audierne, spreading its blue waters. To the right, the Bay des Trépassés is encircled by

menacing reefs, and the Pointe de Van stretches out its white promontory. Opposite is the Raz and its dangerous shoals; then the legendary Ile de Sein, a piece of land lying so low that the waves seem as if they would engulf it. No traces of human life; not a sail in the wide horizon of waters, nothing but the continual roar of the waves and the sharp cries of the gulls sweeping round the rocks. It is the end of terrestrial life, the beginning of a wild and solitary infinity. Our guide leads us by a narrow path at the edge of the rocks to the Enfer de Plogoff, as dangerous as its name denotes. We sometimes lie down on our faces, and creep between blocks; or place one foot on ledges the size of the hand, or descend the irregular steps formed in the stony crevasses. But when we reached the granite gulf, we felt recompensed by seeing the formidable assaults of the waves against the dripping rocks which form the walls of the abyss. They rush from all sides through channels worn in the interior of the Pointe, meeting and beating furiously with the sound of thunder. The dark billows boil as if in a magic caldron, throwing up vertical spouts, which scatter into sheets of white foam; and then, as a contrast to this deep shade and fearful noise, we gaze upwards to a serene blue sky and a bright sun shining over us.

The ascent is less perilous than the descent. At the end of a quarter of an hour, we are on the edge of the bay, where we perceive the Lake of Laonal, separated from the sea by a narrow strip of land. We are told the legend of the city of Is. On the site of the present lake, there stood in the fifth century a fabulous city, the Sodom of old Armorica. The fishermen who ply their craft on its still waters see the palace and towers in ruin beneath. King Gradlon reigned over it, defended, as it then was, against the inroads of the ocean by high banks with a strong sluice. The silver key that opened it was always hung round the king's neck. The reigning beauty at court was the Princess Dahut, Gradlon's daughter, with long tresses that shone like gold. She reigned over all hearts, as her father did over the sea; but she was herself the slave of her own passions, and her conduct made her a public scandal. The old monarch alone shut his eyes against the errors of an only child. One night the demon that possessed her suggested that she should steal the key and open the sluice. But St Guennolé appeared to the king in his sleep, and cried: 'Gradlon, make haste to save yourself, for Dahut has opened the sluice, and the sea is pouring into the city.' The good man, filled with a father's pity, refused to mount his horse unless his daughter would also ride on the croup; and loaded with this dangerous burden, he galloped out of the gates. Just at that moment a fearful roar sounded behind them. The great city of Is was overwhelmed by the rushing wave. In terror, the king rode all night, followed by the menacing waters. In the morning, when near Douarnenez, he heard a voice, saying: 'Gradlon, if you do not wish to be lost, throw over the demon who rides on your croup.' Dahut, terrified by the fearful noise, lost her balance, and rolled over into the stream, which stopped as soon as she was engulfed. The place is still called Dahut's Pit, now corrupted into Poul-Davit. We discuss the legend as we get into our carriage. It is the old story of the

siren with golden hair and the voice of the charmer, fatal to all those who listen.

It is seven o'clock before we reach Audierne. The quay, so deserted this morning, is now gay; the fishing-boats have returned; and the visitors, English and French, are on the shore. Delighted, but very weary, we regain our hospitable quarters to enjoy a good supper.

The next day we take a charming walk to the Valley of the Riz. Every step gives you a fresh surprise. Through the splendid trees, you see the sparkling bay; cottages with moss-covered roofs are scattered along; the women in their white coifs are busy washing at the fountains, and talking incessantly. Wild-flowers grow abundantly, and the red-throats sing their sweet notes. We reach a long avenue of ancient moss-grown oaks; at the end is a ruinous wall, covered with ferns, and an arched doorway with a sculptured escutcheon. Within, are farm-buildings in every stage of decay. It is the old manor of Keratry, compared with which, the melancholy dwelling of the Master of Ravenswood was a palace. The ancient family of Beaumanoir once lived here; and as we wandered through the garden, now a wild uncultivated scene, we thought of the days when the fair ladies used to come out in the evening and gather the roses and honeysuckles that are still flowering amidst the weeds.

We climb a hill, from which we see the country. There are manor-houses on all sides—Kerillis, Kerdouarnec, Coat-an-aer, buried in groves of oak or chestnut. It would seem as if, like the Breton peasants, the better classes wished to hide themselves from the eyes of strangers; and if you would get nearer, you must plunge into secluded roads, overshadowed by lofty trees, whence you can see the gray tower of a pigeon-cot, and hear the inhospitable barking of many fierce dogs. Issuing from one of these, we enter a solemn, winding alley of aspen-trees, leading to the church of Ploa-Ré. The grass, strewn with the whitening foliage of the trees, rustles under our tread. It was a quarter of an hour before we reached the end of these severe rows of trees; and the sight of the cemetery made us all melancholy. Upon the whole, that is the impression which Brittany leaves upon the mind. The great silent tracts without culture or villages; the dark deep forests; the brooks, which issue from every quarter, sobbing and moaning; the grave, wild peasants, who speak an unknown language, and distrust the stranger—all these things act upon the nervous organisation. It is like a melancholy mist falling drop by drop, yet penetrating to the very heart.

PLAYING THE WRONG CARD.

IN FOUR CHAPTERS.—CHAPTER II.

THE host of the *King's Arms* was as good as his word; in a very few minutes supper was ready; and, moreover, it was a supper which did the *King's Arms* credit. The next day being market-day, was probably a reason for the larder being unusually well stocked; while the presence and guarantee of Mr Hythe of Myrtle Villa was certainly a reason for drawing upon the best of that larder's resources. John and William, the

well-known first and second waiters, were in attendance; but on Mr Hythe expressing his wish to that effect, they retired, and the party began supping in earnest.

As might be expected, there was but little conversation at first, what little there was being contributed by the founder of the feast, even his remarks sinking after a while to a very low key, and then chiefly addressed to the Professor. Civility of course demanded an assenting monosyllable now and again; but it was plain that the Professor's attention was mainly directed to his supper; yet a change came over him anon; he looked uneasily at the speaker, glanced meaningly at his companions; then laying down his knife and fork, he said, in as low a tone as he had been addressed: 'If you will be good enough to wait a few minutes, sir, until we get rid of the child, I think it will be better. I understand you pretty well.'

Mr Hythe nodded assent; and the Professor resumed his meal, although with a more troubled aspect than before. His companions looked wonderingly on during this whispered colloquy, without speaking, until presently the Professor said: 'Now, sir; with your permission, I will give Mademoiselle Lucile one glass of champagne, and then call the baggage-man to take her to our lodgings; for, as you will readily guess, we do not put up at the *King's Arms*; and I do not care about her keeping very late hours.'

'If you prefer it, I will order her a room here,' said Hythe in an undertone. 'She will surely be very dull in going to a strange house by herself—will be nervous.'

'Oh, she don't mind!' exclaimed Regaldini with a smile, though there was sadness in it. 'In our life, sir, children soon grow out of the nervous fancies you are thinking about. The real hardships of life kill the fanciful ones, and they get enough of *them*, poor creatures!'

So the attendant was summoned, and was directed to take the little girl to Mrs Blimby's, Back Church Row; a very different address from the Market Place or High Street.

When he had fairly gone, Hythe desired the others to select their wine, light their cigars, and make themselves comfortable. 'And that you may be more at ease, in a business point of view,' he continued, 'I will make up your losses of to-day, on your giving me a fair statement; as I have always been a supporter of—of music and the drama, I suppose I must say.'

'You are very good, sir; indeed I do not know how to thank you,' said the Professor; 'for this most awful frost—I mean this failure—has fairly broken us. How we should have reached the next town, I don't know; or how we should have opened when we got there, I don't know either.'

'Have you settled for the room?' began Hythe.

The other interrupted him with a laugh. 'Settled! I should think we had, sir,' he said. 'You don't think the landlord here would run any risk? I wanted him to appoint some one to take the money, and so pay himself; but he said that was not in his line. He knew the town; I didn't.—But, sir, you were speaking of some business in which you thought I could serve

you. Now the child is gone, you may speak out.'

'But—you see it was private,' began Hythe.

'And so it will be now, I guarantee,' interposed the Professor. 'I will answer for Charley—that's my friend—and so would you, if you knew him. Besides, I fancy the business will be more in his line than my own, if I correctly caught your meaning.'

Hythe hesitated a few seconds, as though rather disconcerted at having to confide in two persons instead of one; but shaking off this reluctance, began: 'Seeing the ease with which you assumed character after character, each so widely differing from the others, Mr Regaldini, and the wonderful manner in which you concealed your identity, it occurred to me that you might, at little trouble to yourself, do a great service to a near relative of my own, who is gradually sinking into fixed melancholy, if not insanity, by dwelling on a fixed idea—a delusion. Now, there will not be the slightest risk to yourself, as you will see, and you will be well paid for your kindness; I ought, perhaps, to say "for your talent," as I have no doubt your kindly feeling would prompt you to serve an unfortunate gentleman disinterestedly. I have a brother, Mr Regaldini'—

'Excuse me, sir,' interrupted the Professor; 'but now that we are coming to business, I should take it as a favour if you would call me "Styles," which is my name, the other being only professional.'

'Certainly, Mr Styles,' assented Hythe. 'And your friend?'

'Well, he really is a foreigner,' said Styles; 'but not with such a name as we have given him. If you call him Mr Charles, that will do, and indeed that's what his name means.—Now, sir, we are at your service.'

The musician had scarcely spoken a single word in Mr Hythe's hearing, but had listened intently. 'My brother, gentlemen,' proceeded Mr Hythe, 'labours under an increasing remorse for a wrong which he thinks he did many years ago; and despite of all argument to prove how unavailing this morbid regret and self-reproach now is, he gives way to it more and more. Nay, so completely has the feeling possessed him, that he will alienate his property from his real family, or at anyrate postpone their possession of it for many years, and even then they will only share it with some charitable institution. My children and I are the family I refer to, gentlemen. You see I treat you with perfect frankness, as I am not a man to do things by halves; and having said this, you will not wonder when I say it is worth my while to give a twenty-pound note, in addition to all expenses and losses, which latter I will settle at once, in order to get the business to which I allude done, and well done.'

The attention of the listeners became keener after this sentence, and Mr Styles involuntarily hitched his chair a little closer to the speaker, as though anxious not to lose a word.

'My brother'—Mr Hythe hesitated a little here, as though he knew that this was the key-stone of his communication—'my brother, early in life, while on his travels, was entangled, as many young men before him have been, by a certain intimacy. He says now that he was married; but that I believe to be a

delusion. However, to adopt his own fancy, he was abroad with his wife, and becoming ashamed, I suppose, of the connection, he—he left her; left her with one child. He was under another name at the time; there is no doubt of that; but he heard of his father's death while he was abroad, and so was anxious to come home to take his property, and not anxious, as you may suppose, to bring home the half-bred foreigner—a Brazilian, or Bolivian, or something of that kind. So he left her.—You follow me so far?’

‘Yes, sir; all right!’ said Styles.

‘Yes, sir; there is no mistake about what your brother did,’ said the musician, speaking for the first time. He spoke with a strong foreign accent, which slightly distorted his words, but he spoke readily enough. ‘Serve the foreign person right, for being such a fool.’

‘Ah! well, I won’t say exactly that,’ returned Hythe, speaking compassionately on behalf of the foreigner. ‘It was not handsome on his part; but there was great excuse for him. He left her all the money he could spare. But after he came home, his previous infatuation returned, and acted upon him so strongly that he positively went back to where he had left her—New Orleans.’

‘New Orleans!’ echoed the musician. ‘I beg your pardon, sir, but I follow you with great interest.’ So he probably did, for his thin, eager face was thrust forward, and his sunken eyes gleamed so brightly under the ragged hair which hung over his forehead and around his head, that Hythe felt almost uncomfortable when he encountered their glance.

‘But he could not find her,’ resumed Hythe; ‘yet he heard of her, unfortunately. He heard a great deal of exaggeration, no doubt, about her despair at being left; but that would not have mattered so much, only that he heard also of her having been robbed by those around her, and left with her child almost penniless. She had gone away from New Orleans; and it was supposed she had tried to reach her friends—an attempt almost hopeless, as they were said to live hundreds of miles away; where, my brother never exactly knew. His mind perhaps was a little affected by some irregularities and exciting adventures in which he had been a partaker. Whatever the cause, this incident preyed on him greatly. He returned to England, led the life of a hermit, kept out of society, and made no secret to me that he did not consider himself at liberty to marry, having a belief that his wife—as he called her—was still alive. We—I—well, his family were naturally satisfied with this arrangement; but a few years ago he had a dream—he talks of it as a vision, a revelation—in which he saw his wife and child.’

‘This child—was it a girl or a boy?’ asked the musician.

‘A girl,’ replied Hythe. ‘Well, he thought he saw them, and they told him the child was still alive, and would live to see him. On the strength of this dream, he has altered his will to the detriment of his friends, as I have told you; and as a delusion gets the stronger the longer it is indulged in, you will not be in the least surprised to hear that he has had the dream again very recently, indeed, and to the same effect.’

‘But how do you wish us to help you?’ asked Mr Styles, as the speaker paused. ‘I think you said’—

‘I am coming to that now,’ resumed Mr Hythe; ‘but it was necessary to enter upon this rather lengthy preamble, that you might understand precisely how things were. I want one to personate a relative of this young woman; her brother indeed. I have told you she was a foreigner; consequently her relatives were foreigners also; and coming as she did from some precious South American republic, or some such out-of-the-way place, there is not likely to be any one in England who can say you are or are not her brother. I have by me a photograph of the young fellow. I had copies taken, unknown to my brother, from one in his possession, as I thought it might come in handy some day. Now, making yourself up as much like this man as you can, allowing of course for the lapse of ten or a dozen years, you wait upon Mr Maurice Hythe, say you have come over to England on other business, but called to deliver a message you had held in charge for several years’—

‘Pardon, sir,’ interrupted the musician; ‘but you have told us that this gentleman was under another name, a name of assumption. If that is so, he will say, quite natural, how do you know where I live—how do you know me at all?’

‘Hum!—yes; that’s true,’ returned Hythe thoughtfully. ‘I must think it over. But I fancy I see a way out of the difficulty; so we will proceed. When you have introduced yourself, you must speak to him of your sister; say that when he left her, she sought refuge with an old lover to whom she was greatly attached, and telling him that she was left a widow, induced him to marry her; that she lived with him several years, until both she and her daughter died of fever, or cholera, or something.’

‘Very good, sir; most good,’ said the musician, as Hythe paused to pour out a glass of wine. ‘The idea is excellent. It will be easy to defame her character. Besides, being dead, and only a foolish girl when alive, why, it does not matter.’

Hythe cast a doubtful look at the speaker, as though there was something in this mode of support which jarred upon him.

‘This communication,’ he continued, ‘which I have no hesitation in saying—knowing my brother’s character—will be implicitly received as authentic, will at once and for ever settle all this delirium about dreams and visions.’

‘I have heard of some such plan, when a man thought himself haunted by a ghost,’ said Styles; ‘they got some one to represent the ghost, and’—

‘Ah! this is not at all like that,’ hastily interrupted Hythe. ‘My brother does not believe himself haunted, and you will not have to personate any one he has ever seen. You can come with me to my house to-night, Mr Styles, and I will give you the portrait of the man you are to personate.’

‘I can’t do it, sir—I can’t indeed,’ said Styles; ‘my nerves are gone, sir. What with continual ill-luck, and five-and-thirty years of this life,

and—I must own—some hard drinking of late, I haven't the nerves for such work. That's why I told you to take Charley into consultation. He is wonderful good at all disguises, and I don't believe he's afraid of anybody or anything in the world.'

'But I was so struck by your cleverness to-night,' urged Hythe, 'that I thought you were just the man; while Mr Charles here, if that be his name, cannot have had much experience.'

'Bless you, sir!' returned Styles, with a melancholy smile, 'what you saw me do, is mere habit and knack. All the tricks are handed down from one showman to another; there's not a spark of originality in the business. As for Charley's experience! if he chooses to do it, sir, he can alter his face while he is sitting there, so that you could hardly know him.—Couldn't you, Charley?' In lieu of answering in words, the musician bowed his head for a moment, ran his hand hastily through his wild hair, altered his necktie, then suddenly lifting his face, thrust it forward towards Mr Hythe, with so fearful a grin, and so terrible an expression in his eyes, that the gentleman half leaped from his chair with an exclamation of alarm.

'Aha!' cried Styles; 'has he changed his expression, sir?'

'Changed his expression!' echoed Mr Hythe. 'I never was so startled in my life. I would sooner have found myself face to face with a mad wolf or a tiger.—I do not know whether you will take it as a compliment, Mr Charles, but I assure you I never saw so hideous a face on human shoulders before. I don't want any further proof of your power.'

Styles laughed at this speech; so did Charley; but whether the latter intended the grin to be in keeping with his wolfish aspect or not, it certainly made Hythe shudder again, and cast a second look, to assure himself that the musician had not gone suddenly mad.

'You are satisfied then, sir?' asked Styles. 'I can tell you there is not a man in the profession who could have made such a change without paint or dress, as Charley has just done.'

'I should think not,' said Hythe, with emphasis; 'I may almost say I hope not. I should have preferred you, I must own, Mr Styles; but after what you have said, I have no choice except to take Mr Charles.—It will be as well, sir'—addressing the musician—'to come with me at once to my house, which is only on the outskirts of the town, and I will give you the photograph.'

'We will both go,' struck in Styles; 'a walk will do me good, and Lucile is asleep by this time.'

'Then your daughter's name is really what you call it,' said Hythe, with a smile. 'I did not feel certain of that, as I must say you allow yourself a good deal of latitude in your selection of names.'

'The public will have it, sir,' replied Styles, very seriously. 'If we were to keep to our own names, or were particular about countries and propriety, and all that, we should not draw a penny. But Mademoiselle is not my daughter; she is not related to me; she is a relative of

Charley's,' he continued, dropping his voice—the musician was putting on his coat at the further end of the room. 'He does not like to talk about her before strangers, yet he dotes upon her, though he don't show it, and would kill anybody, or himself, or her either, rather than she should come to any harm. He is a strange fellow, he'—

The musician coming towards them at this moment, Mr Styles abruptly checked himself, and after a brief conversation bearing upon the financial result of the entertainment, the three left the *King's Arms* in company.

Very little was spoken among them on the road to Myrtle Villa; Hythe and 'Mr Charles' were evidently absorbed in reflection; while Styles, who would possibly have been more loquacious if left to himself, was overawed by the silence of his companions, and conscious perhaps of having drunk sufficient wine to render loquacity dangerous. The inmates of Myrtle Villa had retired; but Mr Hythe opened the front-door with his key, and took the others into what was apparently his own room. Here he unlocked a desk, and taking from it a packet of photographs, selected one which he threw towards Charles. 'You will find his name on the back of it,' he said—'Don Something. You of course pretend to be him. Do you think you can "make up" anything in his style?'

'That he can!' exclaimed Styles, who was looking at the picture over the musician's shoulder; 'he will do it to perfection, for he has just got the face for it.—Charley, my boy! if the part had been written for you, it could not have suited you better.'

'There is one thing, Mr Hythe, which we must not at all forget,' said the musician; he was still looking at the portrait, and he spoke in so low a voice that, his head being bowed, he could hardly be heard; 'I cannot arrange without knowing this gentleman's other name. How can I go and see Mr Hythe, when you tell me he travelled as Mr Somebody-else? You said you would think over that. There is no other way but telling me this name.'

'No—I suppose not,' slowly returned Hythe. 'I have been turning it over in my mind a good deal since we spoke, and I see it would be absurd for you to go on such an errand and not know his assumed name. However, I expect he will be too excited to ask how you found him out. Say, will you undertake the business? You understand the pay.'

'I will undertake it, sir,' said the musician, lifting his head suddenly. His dark, sallow face was almost of an ashy paleness, and although the vicious tiger-like expression was not there, there was something so unearthly in his look, that Mr Hythe recoiled with an ejaculation which was almost of terror. 'I will undertake it, sir,' said Charles; 'and shall be quite satisfied to leave all question of pay to yourself. I trust you will say I have done my work thoroughly, when that work is finished. I shall be ready to-morrow. Will that suit?'

'Yes; the sooner the better,' returned Mr Hythe. 'You are sure to find him at home—that is one comfort.'

A short consultation then took place, in which Hythe gave some further advice as to the pro-

ceedings of Mr Charles, and then the two professionals took their departure.

'A clever man, no doubt, and will just suit the business,' muttered Hythe, standing at his door, while he watched his confederates as they crossed a patch of moonlight and then disappeared in the shadow of some buildings. 'A very clever man; but I think if I had known as much of him when I began, as I know now, I would not have had anything to do with him. A foolish prejudice, I daresay; but it seems as if I were in partnership with a hyena.'

PAVEMENT PORTRAITS.

A MAN IN POSSESSION.

THE original of this Portrait was first encountered by the painter of it at a sculptor's studio at Hampstead. To this studio at that time—ah, years ago!—used to come on Saturday afternoons a number of young men, who—the week's sculpturing, painting, writing, reading, or work of any sort done—were wont to gather together for fencing, boxing, smoking, and talking purposes. What a merry gathering it was! How we 'turned to mirth all things of earth' in our thoughtless careless youth! and with what paternal dignity the grave old sculptor—not really old, but old in comparison with us—to whom the studio belonged, enjoyed our merriment; applauded the skill of some of us; laughed at the awkwardness of others; encouraged a smart talker, or boxer, or fencer; deprecated a loose expression; censured a false cut or blow; and played the rôle of gentle Mentor, ruler and umpire of the games.

All are scattered now and fled;
Some are married, some are dead.

But although these sad words do apply in a general way to members of that weekly gathering, there is among those who survive, one at least who is as sprightly, as active, as gay apparently, as in the days of yore. Age has not silvered his locks, for what there was of them in the old days were white as snow then. Time has not bent his figure, which always put to shame in its uprightness the rounded shoulders of some of his youthful play-fellows. Years have not dimmed his eyes, in which laughter lives now as then. The wrinkles in his good-humoured face are not more numerous than they were, for I never remember his face capable of accommodating more than were already there. His moustache is as fierce and thick, his 'imperial' as heavy, as they always were, and the only change in this Portrait is in his clothes. These, it must be admitted, have grown very shabby. It looks to me as if the same frock-coat which did duty in the studio does duty now, and it is not in the nature of things that a coat should not age with the rolling years, however well the wearer of it may wear.

It was always the feature of the afternoon when 'Young Dick,' as this Portrait was called in the boxing-days, made his appearance at our rendezvous. 'Here he is!' was the general cry; and we all did our best with the gloves, or the

foils, or at singlestick after his arrival; for he was our Professor, not a paid tutor, but a happy honorary master in the cunning and noble arts. That was really his profession, as an inscription on a wire-blind in the window of a dingy white house at Holloway informed the public of the north of London. He made a fair living at his calling. He worked hard; and his one afternoon a week of thorough relaxation was on Saturday, when he came to the studio. His fund of information was wonderful; and when our more active amusements were finished, we would gather round 'Young Dick,' and listen long to tales of his travels 'from China to Peru,' told in a charming manner, and enlivened with flashes of real wit.

'Young Dick' disappeared from my life when the studio days—as all days do—came to an end; and I had nearly forgotten his existence, when a little while ago, he almost knocked me down as he dashed round the corner of Wellington Street, Strand, flying apparently before a blast which was desolating Waterloo Bridge of its dust.

'Hul-lo! Well, I never! Here's luck! How are you, old fellow? This is *too* much! What an age it is! Why, you're looking well. Come along—no refusal—do as you're told. "Short's" is the word.—What's it to be? Not turned teetotaler, eh? Port or sherry—both are good over there? Come over at once, before we both subside under our feelings.'

His arm was slipped through mine, and I at once noticed the very scedy coat. The jerky exclamations were still jumping through his lips, and I had hardly time to reply to one of his questions, ere I found myself with 'Young Dick' in the wine-shop over the way which he had indicated by the word 'Short's.' Here we surveyed each other from head to foot; and here we talked; and here I heard of the change which had really occurred in the existence of this Portrait, whose manner and outward appearance—always barring the clothes—were so unaltered. Over our glass of sherry, poor 'Young Dick' became quite confidential; and this is what he told me, and how he told it.

'Seen any of the old lot lately? I never see any of them now, though I heard how poor Howse and his brother died of consumption. Sad that; two promising careers cut short. And how Beach married, and hasn't a halfpenny to bless himself with. Turned photographer; began on an acre of canvas, and now finishing up on a square inch of muddy metal—for he goes in for "ferrotypes"—I think he calls them. And how Riley went to the bad, and married a rich old widow. How famous Mew is becoming as a doctor; and what a stir young Stone is making with his writings. That's about all I know of them. I suppose they've all forgotten me—all except old Jupiter Tonans, the ruler of our games. I have reason to know *he* remembers me. Do you ever hear them speak of Young Dick?'

I thought I noticed a sign of deep feeling in a certain quiver of the lower lip as he asked this question, a quiver which vanished like a bubble in his glass as I replied: 'O dear, yes. Indeed, they've not forgotten you. As far as I know, you are the best remembered of the whole lot.'

Then he laughed—not a hollow laugh, or a mocking laugh, but a laugh as if a joke had occurred to him, amusing him so much that he needs must laugh. ‘Ha! ha! I wonder what they would all say if they knew what I am now? I don’t want them to know; but I won’t ask you to keep it a secret, for some day one of them might find out in an unpleasant way what I am. Why, my dear sir, I’m a man in possession!’

‘What!’ I exclaimed; ‘a broker’s man, you?’

‘Yes, that’s me. When there’s no regular work to do for the Court—the “Bankruptcy,” you know—I take any odd job of the sort. I don’t like it; but as Marwood, that other executioner, says, somebody must do it; and as my wife and children can’t, or sha’n’t starve, why, I must do something. I’ll tell you all about it.

‘A long while ago I broke my arm. This threw me out of my profession for a good while; and when I did try to take it up again, I found that my profession had chucked me up. A friend of mine in the Bankruptcy Court had to settle my affairs, and when that was done, there was nothing but six open mouths and six empty stomachs left. The friend who helped to “white-wash” me offered me a queer berth, which in sheer desperation I took. I go “into possession,” sometimes for the Court, to guard goods against too rapacious creditors; and sometimes for a rapacious creditor, in which latter case I always am as gentle as I possibly can be. It isn’t very nice; but on occasions I have funny cases to attend to. There was one the other week. A young artist—a silly but nice fellow—having taken a house far too big and expensive for him, very shortly came a cropper, and I was “put in.” Well, I hadn’t been there many hours, when a whole troop of his friends came to see him, thinking to enjoy themselves in this grand big house. I let them all in. My host wasn’t at home. I told them so. They didn’t seem to mind this, but asked for some whisky. I told them there was none. They were surprised, and begged me to go out and get them some. Then I had to tell them what I was. They all roared, as they exclaimed: “What, in possession! We thought you were the new butler!”

‘But last Monday I had a shock. You must know I have a nephew, the only son of a dear dead sister, who has been the pride of my life; so good, so respectable, so flourishing. And strange as it may seem to him and his wife and family, I have always appeared the same—good, respectable, flourishing. Whenever I went to his house, I always put on my best clothes and manners; and they in their turn put the best dinner they could upon the table, and gave me the warmest welcome. He is a clerk in the City; has a very good place, and has hitherto done well. Not saved, but lived comfortably, just within his means. Judge, then, of my horror, when last Monday I was sent for by one of my employers and instructed to go and take possession of No. — Old Kent Road—my nephew’s house! What could it mean? I thought the matter over; and as soon as I was calm enough to make a definite plan, I accepted the job! I went home, and wrote poor Walter a note, saying I was coming to see him the following day; and on Tuesday I dressed myself as smart as possible,

and went, just as if I had come to pay them one of my ordinary visits.

‘I found the house as tidy as ever, the children as cheerful; Walter and his wife, apparently, as pleased to see me as they always were. We had dinner; and Walter, his wife, a neighbour, and I played whist afterwards—threepenny points. I lost five shillings, I am glad to say; and Walter did, what he had never done before, made a revoke. It grew late. The neighbour went. I said I would like to smoke another pipe. Walter, who never went to bed early, seemed pleased at this, though he was at this period rather *distract*—said the revoke he had made worried him. His wife went to bed. The night was passing. Suddenly I feigned great fatigue—you know I could not go away—and begged that I might sleep on the sofa. There was no spare bed ready; so Walter having made me as comfortable as possible, left me, and went up to his own room. I didn’t sleep much, I can tell you. I took my boots off, and walked up and down and round and round that little room all night. The chairs, the tables, the books, all seemed to rebuke me. The carpet was like red-hot ploughshares to my feet. The sofa would not accommodate my aching bones. The gas grew hazy as I looked at it through that long night, and the clock striking every quarter of an hour seemed to shriek at me to go. It was awful.

‘At last Wednesday morning came. Walter came down. He looked quite ill in the early morning light; but his care was all for me. He expressed great anxiety for my health. He bade me stay for the day. He offered to get me a doctor. I accepted the invitation to remain, and refused the doctor.

‘Walter went to his work; and no sooner had the door shut, than his pretty little wife, without a word of warning, burst into tears, and flinging herself on the sofa, sobbed out: “O Uncle Dick, those horses have ruined my Walter! I must tell you. He’s been so misled. He’s lost all his money, and borrowed a fearful lot, which he can never repay, and we are in daily expectation of a man being put in possession.”

‘The crisis had come, and this gentle little creature had to bear the brunt of it. I, the respectable uncle, to whom this heart-rending confession was made in a way which clearly showed me that the poor thing thought her revelation would produce help, had to reveal why I was really there! It was done somehow. A series of fainting-fits ensued. Men don’t faint; I wish they did; for I certainly should have availed myself then of the privilege, if it had been mine. I wanted to faint away altogether, and never come back.

‘When my niece was better, I got up, and having given her a kiss which would not have made Othello himself wince to see, I cut away as hard as my feet would carry me.

‘I went to Walter’s office to-day, and heard that he had made a clean breast of it to his employers. They have advanced sufficient to help him out of his scrape. He has forsworn racing; and I—well, it will be a long while before I set eyes on that family again—and I’ve lost that employer.

‘Good-bye, old chap. Glad to have seen you. It’s a funny world, isn’t it?’ And with something

like a stoppage in his throat, 'Young Dick' seized my hand, squeezed it hard, and in another moment was out of sight, swallowed up in the stream of humanity pouring along the Strand.

A PET TROUT.

It is, I believe, somewhat unusual for a trout to live, grow, and flourish in a small tank; still more uncommon, perhaps, that a fish of this species should become as tame as the individual in my possession. He lives in a small rockwork cistern in an unheated conservatory attached to my house. He was placed there, I believe, by the preceding tenant in 1879, together with a number of other small fry of his kind. At Michaelmas 1879, when I took the house, I found that by cannibalism or other causes the trout were reduced to three, of which the largest—the subject of this note—was about the size of one's forefinger. Before the end of the following spring, our friend, like the survivor of the *Nancy Bell*, and by similar means, had effectually disposed of his two companions; and since then, has lived in solitary state, save on one occasion, when some unfortunate small fish—roach or gudgeon—happened to get in from an adjoining compartment of the tank. On them he promptly dined.

The division of the aquarium in which he resides measures seven feet in length, fifteen inches in depth, and eighteen inches in average breadth. He is monarch, therefore, of about eighty gallons of water. For a few hours each day, but not regularly, this is renewed by a small fountain which plays in the centre of the tank.

Until last spring, I must confess that I paid scant attention to my finny friend. I could not approve his too great liking for his own species, and it had not dawned upon me that I could possibly make a pet of him. How he existed, is a matter of physiological interest. Occasionally during the warmer weather, some one or other of us would toss a chance spider or earthworm into the tank, and these the trout would supplement by a fly or two caught on his own account. But during the severe weather of 1879–80, and again in the winter of 1880–81, the whole tank-water was for weeks, to all appearance, a solid block of ice; certainly it was so thick that we could not possibly break it. My man tells me that for a period of five weeks consecutively during the latter winter the tank was covered in every part by a sheer ice-sheet—not a crack or air-hole anywhere to be seen. I felt certain that the fish must all be dead, and was considerably astonished to find—as soon as the thaw allowed us to remove the ice—that not one in any of the compartments was, as far as one could judge, a whit the worse. (I should say, however, that some very large gold-fish which survived the ice of the winter 1879–80, died one by one in 1880, when the warmer weather of spring set in.) It goes without saying that not a drop of water flowed into the tanks during the whole of the severe weather.

Up to the spring of 1881, the trout had made scarcely any progress in his growth; but during the summer, he had so developed that he measured seven and a half or eight inches in length. This

may in part be attributed to the tremendous petting which he received. His survival of the winter and his tameness made him in a small way a local celebrity.

Not only has he since feasted continually upon the peculiarly fat and well-to-do spiders with which my garden abounds, but visitors have come to see him, armed with boxfuls of web-spinners hunted out from cellars and elsewhere for the occasion. Not that our friend would accept indiscriminately whatever was offered to him. On the contrary, when spiders—his favourite and usual food—were abundant, he would disdain lanky and attenuated specimens, for which at the present date (November 1881), when choice spiders are scarce, he is only too grateful. Similarly, he would reject a whitish spider, which I occasionally offered him; light-coloured spiders indeed, as a rule, he took less readily than dark. Nor was he very partial to spiders which had been confined in boxes. He had a decided preference for those freshly caught. Spiders, when you shut them up together, devote themselves to each other's extermination with a pertinacity worthy of a better cause. Whether angry passions evoked acrid juices, or whether the survivors fell short of his standard of liveliness, is uncertain, but Mr Trout clearly showed his disapprobation of them.

His favourite morsels were certain juicy females of large size, abundant in summer and autumn. He would take a dozen to twenty of these in rapid succession, rising at them as I dangled them from the tip of my finger. Moths and various kinds of flies were occasionally offered, and he generally took them; with bright-coloured or hairy caterpillars, he would have nothing to do. Yet his voracity was very great, and I have seen him dash at a white-handled penknife with which a friend of mine was endeavouring to remove a wasp which had fallen into the water. Wasps, by the way, I believe he never attempted to take, although they occasionally fell into the tank by accident, or were put there unknown to me. I am inclined to think, from some remains I saw floating on the water, that he once or twice devoured portions of a humble-bee. I do not feel sure of this, though. He is partial to earthworms, but will sometimes refuse them for a spider. He swallows his food voraciously and almost immediately. When he seizes an earthworm too large to be so summarily disposed of, he will rush up and down his tank at great speed. Dead things he avoids, and generally waits for some movement of his victim before he advances upon it.

His manner of taking his prey varies. If the insect sinks in the water, he quietly swims up to it, seizes it, then turns round and returns to his lurking-place. Sometimes he takes the food before it reaches the bottom of the tank; at others he picks it off the gravel which forms the bed of the aquarium; but there is never any hurry. It is however, very different, when the bait lies on the surface or hangs suspended above the water. Then he comes with a rush and splash, making nervous people 'jump,' especially when—as is frequently the case—they are peering over with noses down, declaring they 'cannot see anything.' This rush is not the result of fear or trepidation, but arises from his knowledge

—instinctive, if you like—that, while beneath the surface, an earthworm, or spider, or anything not a fish, can be captured at leisure, there is no such certainty as to things above the water. He seems to be aware that they may elude him or take wing, unless he is very sharp. So far from feeling any fear, he will always, when hungry, and seeing me at the edge of his tank, come out from his favourite lurking-place, and place himself immediately below the outstretched hand in which I hold the expected spider, waiting till I let it fall. Sometimes he executes a preliminary flourish up and down the tank.

Curiously, he appears to know me, and will certainly and unmistakably prefer to take food from my hand than from that of a stranger. By dangling a spider a considerable distance above the water, I have several times made my pet leap entirely out of the water, and very curious it has been to observe his pink spots and silver scales so close to one. In rising thus at objects above the water, he takes a half-turn round from right to left in the act of seizing the object, bringing his belly uppermost, and falling into the water beyond almost flat on his back, when the leap has been a high one. This turning to grasp his prey is shark-like; but he does not turn over when seizing a worm or insect *below* the surface. When the object lies *on* the water, his rush is too rapid and his body too indistinct, to enable me to say positively whether he turns or not. As a rule, I think he does not.

He has three favourite stations in his tank; and from the first two which I shall mention he rarely stirs, lying there for hours, a dark object, his white mouth opening and shutting as he forces the water through his gills. The first is underneath the leaves of a Cape pondweed which grows out of a flower-pot sunk in the water—and round which, by the way, he commonly takes a triumphal swim, after receiving a more than usually luscious spider, never failing, however, to present himself again for another of the same sort. His second post, more favoured since the pondweed has died down, is underneath a miniature rock-work bridge which spans the water. Here he lies, as a rule, on the gravelly bottom, with his body closely applied to the stone-work side of the aquarium, accommodating his tail to the curved direction which the tank has at this point. When inclined to feed, however, he rises midway to the surface, and there waits his opportunity.

His third post is somewhat of a puzzle to me. It is the only point in which he displays any shyness; and he invariably dashes from this part of the tank with a great splutter the very moment I enter the conservatory—rushing, nevertheless, to the spot at which I generally feed him, and taking his spiders very much as usual. The post in question is at the very surface of the water at one end of the tank. It is the best lighted end of the aquarium—his lurking-places are at the darker end—and the only conclusion I can come to is that his object is to sun himself. Why he is so ashamed of it as he appears to be, I cannot tell; but I believe, from the evidence of scientific research on the hostile influence of light upon the lower fungi, that sunning is essential to fish as a preventive of the parasitic fungus-disease which attacks them. I have observed

goldfish so affected rising to the surface of their pond and lying in the bright sunlight; but whether there is anything instinctive in this, or whether it is the result of weakness induced by the disease, I cannot pretend to say.

THE CHOICE.

A FAIRY there lived in the long, long ago,
Possessed, it is said, of all manner of skill;
And this Fairy proposed on a Youth to bestow
The gift he chose greatest for good or for ill.

'Wouldst thou be the gift the bold Warrior wielded,
The Fairy commanded the stripling to say;
'As leader of legions, and victor of fields—
Unbounded thy glory, unquestioned thy sway?'

And straight the Youth answered: 'The Warrior bold
In his train bringeth Death, with its visitants grim,
And carnage, and ruin, and horrors untold,
To compass a bauble, or sanction a whim.'

'The Orator's gift then, say, shall it be thine,
Unrivalled in diction, unmatched in debate;
Far above all thy fellows still destined to shine;
The star of the senate, the hope of the state?'

Again spake the Youth: 'True, the Orator's tongue
May trumpet-like summon humanity's shoal:
But once Passion's gates on its hinges are swung,
Say, *then* can the Orator guide and control?'

'Well, be it thy choice, the Philosopher proud,
In wisdom and learning, of all, the elect;
The fearless uplifter of error's dark cloud,
The subtle diviner of cause and effect?'

'I care not to wield the Philosopher's staff,'
Once again, half-regretful, the stripling spoke out;
'For his woes are but veiled by the cynical laugh,
And his vitals are gnawed by the demon of Doubt.'

'Ah, then,' cried the Fairy, 'the Painter's career
Is a glorious one truly to reckon upon;
His art brings the distant for evermore near,
And the shadow is sweet when the substance is gone.'

'Not for me be that art,' was the stripling's reply;
'Tis a mockery cruel as death, and a snare;
For the canvas is deaf to the passionate sigh,
And the rapt look of love is repaid by a stare.'

'Is the gift of the Poet thy bosom's desire,
To revel in fancy and sparkle in song,
And gladden men's hearts with thy rapturous lyre,
When wounded by sorrow or burdened with wrong?'

The stripling's eyes glistened with sudden delight,
And his heart thrilled with raptures he might not
control;
For the Fairy had fathomed his secret aright,
And the gift of the Poet has entered his soul.

RECENT EGYPTIAN DISCOVERIES.

THE official Report of M. Maspero, the Director-in-chief of the Museums of Egypt, on the strange and startling discoveries made last year in Upper Egypt, is now published; and, as the Report has not yet been translated into English, it may interest some of our readers to have, from this and other sources, a brief account of what was found in the subterranean chamber at Deir-el-Bahari.

For some years, it had been evident to experienced eyes that the Arabs of Thebes had discovered some royal tombs whose locality was carefully kept secret. Papyri* and other objects of great value, bearing the royal cartouches of kings and princesses of the twenty-first dynasty, were finding their way to Europe. An extraordinary abundance of scarabs, bearing the cartouches of Thothmes III. and Rameses II., the two greatest conquering heroes of Egypt, flooded the market. Travellers visiting Luxor, if they were found to be rich and liberal, and not too particular in asking questions about their purchases, might even hear the enticing whisper that the mummy of the great Rameses II.

* It may be convenient to give here a brief explanation of some of the technicalities in use among Egyptologists. *Papyri* are the rolls made of an ancient writing material obtained from the stems of a plant called the papyrus. These papyri are generally covered with hieroglyphic writing, which is now quite decipherable by Egyptologists. A *cartouche* is an oval or oblong inclosure on Egyptian monuments and mummies, as also in papyri, containing the hieroglyphic characters which denote the names or titles of kings. The *scarab* is the sacred beetle of the ancient Egyptians, sculptured and otherwise illustrated on many of their works. Regarding the chronology of Egypt, it may be explained that the seventeenth dynasty of the Egyptian kings mentioned in the above article corresponds to from B.C. 1750 to B.C. 1703; the eighteenth dynasty, from B.C. 1703 (the Biblical period of Joseph in Egypt) to B.C. 1462; the nineteenth dynasty, from B.C. 1462 to B.C. 1288 (embracing the period of the Exodus); the twentieth dynasty, from B.C. 1288 to B.C. 1110; and the twenty-first dynasty, from B.C. 1110 to B.C. 980. These dates, however, must be regarded only as approximations.

himself had been found, and might be had for a consideration! No sooner was M. Maspero appointed Director-in-chief of the Museums of Egypt, than he determined to sound this mystery to the bottom. The task was a difficult one. It meant nothing less than getting the truth out of the Arabs, a nation with whom lying is a natural gift, brought to its highest perfection by constant exercise. Moreover, the particular Arab, a certain Abd-cr-Rasoul, to whom the sale of the antiquities in question could be clearly traced, and who possessed beyond a doubt the secret of the hiding-place, sheltered himself behind the agis of the venerable Mustafa Aga, vice-consul of England and Belgium at Luxor. It was impossible for M. Maspero to arrest Mustafa Aga, shielded as he was by diplomatic immunity; and all that could be got out of Abd-cr-Rasoul, after he had been arrested, imprisoned for two months, and frequently interrogated, was, that he was the servant of Mustafa Aga, and a member of his household.

After a time, Abd-cr-Rasoul was set at liberty, provisionally; and the secret might still have been kept, had not discord arisen in his own family. He had four brothers who shared with him in this profitable mystery; and a bitter difference of opinion arising among them, the eldest went to the Mudir of Kenneh and told him that he knew of the hiding-place in question; that it contained about forty mummies, bearing emblems like those seen on the coffins of the Pharaohs. The news was at once carried to the Khedive. M. Maspero had just left Egypt for Europe; but M. Emile Brugsch, brother of the historian of Egypt, and subconservator of the Museum of Boolak, at Cairo, was, in July last year, despatched to Thebes, where he found the hiding-place in question at Deir-el-Bahari, in which were secreted some thirty-six mummies of kings, queens, princes, and high-priests.

But before we follow M. Emile Brugsch into the hiding-place of the Pharaohs, it may be as well to indicate briefly what manner of Pharaohs they were who were buried at Thebes. Egyptian

history divides itself broadly into three great periods—the Ancient Empire, the period of the Shepherd Kings, and the later Empire. The ordinary Briton has three fixed points whereby he strives to attach the mysterious and unfamiliar history of Egypt to history with which he is familiar—these points being the respective eras of Abraham, Joseph, and Moses. Twelve dynasties, however, of the Ancient Empire had already sat on the throne of Memphis when Abraham visited Egypt. Memphis was the capital of this ancient empire, and the seat of the native monarchy until it was overthrown by the mysterious Shepherd Kings—a foreign race, who conquered and governed Egypt for an unknown period, and about whose origin and history very little is certainly known. But it is supposed to have been one of the Shepherd Kings who was Joseph's patron in Egypt; while, on the other hand, the Pharaohs who 'knew not Joseph,' the Pharaohs of the oppression and the deliverance, are identified with the kings of the Theban dynasties, under whom the Shepherd Kings were driven out of the land, and the Egyptian monarchy restored to more than its pristine glory. The two most illustrious of the Theban kings were Thothmes III. and Rameses II. The latter was he of whom the Greeks fabled under the name of Sesostris. Thothmes III. belongs to the eighteenth, Rameses II. to the nineteenth dynasty.

The great city of Thebes, where the splendid temples of Luxor and Karnak still bear witness to its ancient glory, lay on the eastern bank of the Nile. On the opposite side of the river was the city of the dead—among the limestone cliffs where the kings of the mightiest period of Egyptian history had carved their eternal homes. Between these cliffs and the shore, a series of magnificent temples, of which only the ruins now remain, served as chapels for the funeral rites and memorial services belonging to the worship of the deceased kings, who had ascended to the rank of gods. The tombs of the nineteenth dynasty are well known, and are, from their great extent, their elaborate decoration, the mysterious imagery with which their walls are covered, and the wonderful preservation of their colouring, among the most impressive of the wonders of Egypt. Of the eighteenth dynasty, only one of the original tombs has as yet been identified; though the splendid rock-temple now called Deir-el-Bahari, built by the great queen Hatasu—who has been called the Elizabeth of Egyptian history—appears to have been intended as a mausoleum for herself, her father Thothmes I., and her brother Thothmes II.; and to have been afterwards appropriated by her second brother, the great conqueror Thothmes III., when he succeeded in displacing her from the throne.

The temple of Deir-el-Bahari stands in the middle of a natural amphitheatre of cliffs, which is only one of a number of similar amphitheatres

into which the limestone mountains of the Tombs are broken up. In the wall of rock separating this basin of Deir-el-Bahari from the one next to it, some ancient Egyptian engineer had constructed the hiding-place whose secret had been kept for nearly three thousand years. A shaft six and a half feet square, and about thirty-seven feet deep, had been sunk in the solid rock; at the bottom of this shaft a long passage turned off towards the west, then abruptly towards the north, ending at last in a kind of oblong chamber, twenty-three feet long by thirteen feet in breadth. This was the mortuary chamber where the greater number of the mummies were last year found, and which are now deposited in the Boolak Museum.

As soon as M. Emile Brugsch had arrived at the bottom of the shaft, and at the very entrance of the long passage, he came in sight of a yellow and white coffin; soon another, of the seventeenth dynasty; then more and more; while the ground was so littered with vases, funeral urns, statuettes, and other Egyptian funeral gear, that M. Brugsch, who had to advance in many places by crawling, scarcely knew where to place his hands and feet. What words can picture the feelings of the explorer, as glancing rapidly by the dim light of a candle from one coffin to another, he read on them the well-known cartouches of the greatest kings of Egyptian history! 'I ask myself now,' says M. Maspero, 'if I am not dreaming when I see and touch the bodies of so many great personages, of whom I never expected to know more than the names.'

Brugsch, however, did not waste much time in sentimental reflections. Two hours sufficed for the first inspection, and then the work of removal began. What that work was like under a July sun in Egypt, can be imagined by those who know what the Egyptian sun can do in March, when the thermometer often stands at ninety degrees in the shade. It took forty-eight hours to remove all the objects from the tomb; and many of the mummy-cases, which could with difficulty be lifted by twelve or sixteen men, took seven or eight hours to be carried from the cliff to the banks of the Nile, where they had to be ferried across to join the Museum steamer at Luxor. What a changed state of things for Rameses the Great! Who that saw him embarked in his stately funeral barge, and carried to his painted tomb in the rocks of Bab-el-Molook, followed by the great pageant of priests and singers and mourners, would ever have dreamed that he would be taken thence, and sent pell-mell with a shipload of other royal carcases, in a miserable Arab boat, to be finally laid out in the Boolak Museum for the gaze of the tourist! As the Museum steamer, with its freight of dead kings, steamed down the river towards Cairo, it was followed for some distance along the shore by a crowd of natives, the women with dishevelled hair shrieking and howling, and the men shooting off guns, as they do at funerals.

It may be noted here that the mummies found at Deir-el-Bahari were as a rule inclosed in a coffin or outer case made of wood, or of layers of linen glued and hardened together, and beautifully decorated with religious emblems and hieroglyphs. In some instances, one mummy was found to have two, in others three of those cases. The case is generally shaped like the mummy within it, the upper lid being so formed as to represent a kind of effigy of the deceased, painted in gold and colours. The dead body forming the mummy is occasionally wrapped in a shroud, held together by a series of bandages; but more generally the mummy is wrapped in bandages only. These bandages are frequently covered with written characters. So thoroughly was the process of embalming mastered by these ancient dwellers on the Nile, that some of the bodies show but few marks of decay. A remarkable instance is that of Pinotem II., whose head and face have been photographed, and whose features seem almost as recognisable now as when he was laid in his rocky tomb three thousand years ago.

M. Maspero classifies the treasures acquired by the Boolak Museum, as above described, in two groups: (1) Those belonging to the seventeenth, eighteenth, and nineteenth dynasties; and (2) those belonging to the twenty-first dynasty (the twentieth dynasty, curiously enough, not being represented in the find). The difference in workmanship between the two periods is so great, that an expert can tell at a glance to which period a mummy-case or an inscription belongs, without having to read the cartouches or royal names upon it. The first group belongs to the palmy days of the Egyptian monarchy; the latter, to its decadence.

The first group being the oldest, is naturally the worst as regards its state of preservation; and there are few of the coffins which do not show marks of having been restored, or even renewed in ancient times. Thus, the coffin of the great Rameses II. excited the suspicions of M. Maspero for some time, as it was evident by its style and the spelling of the inscriptions that it was the work of the twenty-first dynasty. But on removing some of the bandages of the mummy, the original inscription placed upon the corpse was discovered, which left no longer any doubt that this was indeed the body of the great Rameses. There are also two curious instances of false mummies, bundles of sticks or rags done up with such art, that if the Arabs had not torn open the bandages in search of jewellery or scarabs, the fraud would never have been detected. The coffin of Thothmes III. had been injured by the Arabs, and the mummy broken into three pieces. But the cloths in which he was originally wrapped still remain, covered with litanies of the dead for Thothmes III., the son of the queen Isi, whose name is therein given for the first time.

The oldest of the relics discovered in this hiding-place was the mummy and coffin of Rasekenen, an early Theban king of the seventeenth dynasty, which flourished about three thousand six hundred years ago. He was one of those who struggled to overthrow the dominion of the Shepherd Kings. The founder of the Theban monarchy, Ahmes I., the con-

queror of the Shepherd Kings, is also among the number. And second only in interest to the bodies of the great military heroes Thothmes III. and Rameses II., is that of Seti I., father of Rameses, the discovery of whose tomb forms such an exciting story in Belzoni's *Travels*, and whose splendid alabaster sarcophagus is now to be seen in the Soane Museum, London. Many of these mummies are still encircled with the garlands of flowers which were placed in their coffins just before they were closed, and which, after more than three thousand years, still retain their blue, red, and yellow colours! These have been ascertained to be larkspur, mimosa, and a red Abyssinian flower not now found in Egypt. In the coffin of Amenhotep I., son of Ahmes, a wasp had entered before it was closed, attracted no doubt by the flowers, and is still preserved, a solitary example of a mummied insect.

The second group consists of coffins and funeral objects belonging to the time of the twenty-first dynasty. We need not enumerate in full the mummies of kings, queens, and princesses of this dynasty which have been brought to light; but mention may be made of one that throws a touch of human pathos over the dry bones of three thousand years ago. In the coffin of the queen Makara, who had evidently died in childbirth, reposes the mummy of her new-born child. This infant, which perhaps only lived a few hours, bears all the titles proper to an Egyptian Princess, even that of 'Chief Royal Spouse!' Domestic affection was extremely strong among the ancient Egyptians; the family bond being a sacred and elevating thing, and women taking a position which is unknown in other oriental states. The presence of so many queens and princesses in this hiding-place shows that their corpses received as much reverence and care as those of their royal husbands and fathers. The mummy of the Princess Isi-em-Kheb, which is conjectured by M. Maspero to have been the last interred in this sepulchre, is surrounded by a rich collection of those objects which in ancient Egypt were always placed around a well-attended corpse: boxes of statuettes, vases for libations, goblets of blue or enamelled glass, baskets full of immense curled wigs, a hamper of provisions for her funeral repast, consisting of legs of gazelle, trussed geese, calves' head, raisins, dates, and fruit of the dôm-palm; and besides all these, a 'funeral tent' or canopy of some thousands of pieces of leather of various colours, wonderfully worked, under which her body had rested while in its funeral barge it crossed the Nile from Thebes.

An immense number of other objects of the same kind, among them four splendid papyri, have been found in this hoard. It is remarkable that almost all these objects belong to mummies of the twenty-first dynasty; the kings of the elder dynasties have brought little with them to this hiding-place but their coffins. This fact has led M. Maspero to conjecture that the cavern was used as a tomb for the Priest Kings, and that they were buried there in regular succession, while it was only used as a hiding-place for the bodies of those Pharaohs and their kin who had been previously buried in other tombs.

It is well known that the fall of the Ramesside Pharaohs, and the usurpation of the priests of

Aimmon, brought about the dismemberment of Egypt. Another dynasty arose in Lower Egypt, and the Theban kings were reft of the richest part of their empire. Thebes, which lay out of the course of the great highways of Asiatic commerce, fell rapidly into poverty. The immense works carried on by the Ramessides had to be suspended, and the labouring population became impoverished in consequence, and broke out into disorders, which the central government was too weak to restrain. Bands of robbers were organised, which included in their ranks numbers of the ill-paid functionaries of the government, the chief object of whose depredations was the necropolis of Thebes, where so much wealth was known to be buried with the ancient kings. All this is matter of history. We have accounts of an inquiry instituted even before this into the state of the royal tombs, and we have the confessions of some of the robbers. They tell us how they picked the gold plates off the royal coffins, stole the jewellery and amulets from inside, and carried off the gold, silver, and bronze vases which had been placed in the tombs. In many cases, no doubt, where it was necessary to make shorter work, they carried off the royal mummy to pilage it at leisure, and then burnt or otherwise destroyed it. This may account for the absence of several bodies which we should expect to have been found in the hiding-place of Deir-el-Bahari along with the other kings of the eighteenth and nineteenth dynasties.

But the care of the government succeeded in preserving the most illustrious of the Pharaohs from the hands of the spoilers. The cercloths of Rameses I., Seti I., and Rameses II., bear several inscriptions, from which it appears that their mummies had been moved at several distinct times to different tombs, for the purpose of having the coffins or bandages renewed. This explains how it is that Rameses II. is found in a coffin of the twenty-first dynasty, and that many of the other coffins have been wholly or in part restored. It is conjectured that it was to save these royal bodies from robbers that they were finally transferred to the hiding-place of Deir-el-Bahari, which hiding-place is believed to have been the family tomb of the twenty-first dynasty. The poverty of the kings of that dynasty prevented their building for themselves splendid painted and sculptured tombs, like those of their predecessors. They had to be content with one common vault, and with varnished wooden coffins instead of alabaster sarcophagi; sometimes, indeed, they were glad even to steal a coffin that had belonged to a former king. Thus the priest-king Pinotem reposes in the coffin of Thothmes I. It is easy to conjecture, from what has been said already, that the weak government of the Priest Kings, and the increase of disorder, led them to seek safety for their relics in concealment; and that being themselves at the head of the priestly order, they had the funeral rites in their own hands, and were thus able to keep the secret of their burial-place till it perished with them.

M. Maspero hints that he has more surprises in store for us yet. He suspects the existence of another hiding-place known to the Arabs. The energy and shrewdness of his colleagues and himself are not likely to fail in unearthing this

new mystery; but even were they to discover the mummy of Menes himself, or of the Pharaohs who built the great Pyramids, they can do nothing to eclipse the glory with which the discoveries of 1881 have marked the Directorship of M. Maspero.

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

CHAPTER XXXII.—A BLUE FOOLSCAP DOCUMENT, WRITTEN IN A STIFF AND LEGIBLE HAND, LAY ON THE PAGE BEFORE HIM.

ON a bright spring evening, Val Strange's yacht dropped anchor in sight of Welbeck Head and Brierham spire; and four stout fellows pulled him ashore, and landed him in a little bay four miles from home. He knew the country; and leaving the waste sea-beach behind him, struck into the fields, and strolled through green meadows and by fast-greening boughs towards Brierham. The very earth was odorous, and the air like balm. Welbeck Head, half-a-dozen miles to the left, looked in the light of the setting sun as if it were built of burnished bronze; and in its hollows lay shadows so purple and so liquid, that one might well have fancied every cranny of the vast headland filled with wine. The western air was refulgent gold; the eastern air, a pearly rose; and the zenith, a blue so soft and dreamy, it drew the soul as well as the eye towards it, and led out all the observer's nature in vague sweet hopes and fancies. Val had surrendered himself to Fate, or in surrendering, had created Fate. Who cared? But he was not at ease. Regret and dissatisfaction lurked at the bottom of all his thoughts. There are times when all things resemble the little book which the angel gave to John in Patmos, and the utmost sweetness has its bitter undertaste and aftertaste. Eye and ear and nostril drank delight as he walked; but the soul sat tremulous in the midst of joy, and read half-veiled prophecies of sorrow and disaster. The heart of man is deceitful above all things. Val had contrived to turn himself from false friend and dishonest lover into knight-deliverer. It would be virtue in Constance to break her engagement with Gerard—

Since therein she would evitate and shun
A thousand irreligious curs'd hours
Which forced marriage would have brought upon her.

Val's acquaintance with Shakspeare could not let him miss an excuse so forcibly put, and so pat to his own desires. And it was virtue in him also to persuade her to break that bond. He persuaded himself that he had been a coward in running away, and that it was a duty towards all three concerned—towards Constance and Gerard and himself to hinder a union in which on one side there was no love and no possibility of love. Let a man set himself to the task of self-persuasion—let him gag Conscience, and lend his ear to his own soul's sophistry, and he can credit anything. Val is not the only man who has transmuted scoundrelism into heroism, or deified his own desire and set it up as duty.

He was not by any means sure of his plans; but he was resolved on enduring no delay. He would find a means of communicating with

Constance, and he would leave no effort unmade to deliver her from the possibility of a loveless marriage. He was willing to face contumely, to endure his friend's hatred and scorn, to know that hard things would be said of him by men whose judgment he valued. And since he quailed from these things in his inmost heart, he found it heroism to face them, and was no more a fool or a villain in that self-deceit than ninety-nine out of a hundred might be if they set their minds that way. 'So *carpe diem*, Juan, *carpe, carpe*.' Ah, the note of joy rings false in the voice of the most mournful of all British singers, and in the silence that follows may steal the tones of an older and a wiser poet: 'Rejoice, O young man . . . but remember!'

Walking in such mood as I have striven to indicate, Val came in the course of half an hour or thereabouts upon that ugly landscape-spoiling property of his, the paper-mill; and there, in the act of mounting his dogcart, was Henderson the manager. Henderson, catching sight of Val, descended and awaited his coming.

'The sight of you is good for sore eyes, Mr Strange,' said he. 'You are looking wonderfully well, sir.' And indeed Val was mahogany coloured with his six weeks of sea-breezes.

'Any news in this dull quarter of the world?' he asked.

The manager quite stared at him. 'News, sir? Haven't you heard?'

'Heard what?'

'You don't mean to say,' said Henderson, 'that you know nothing of what has happened to anybody down here?'

'But I do mean to say it,' Val returned. 'What has happened? Whose cat is dead?' For Mr Henderson was a marvellous retailer of marvels which had in them very little of the wonderful for other people.

'Lumby Hall and the Park are in the market, to begin with,' responded the manager with something of the air of one who justifies himself.

Val turned pale under his bronze, and repeated the words questioningly: 'Lumby Hall and Park are in the market?'

'The House has gone to pieces. The cashier, Snarling—no, Garling—that was his name—bolted with half a million, so it's said, and everything has gone under the hammer.'

This news shook the hearer from head to foot, and he held on by the rail of the dogcart, and cast so stricken a look on Henderson, that the worthy man was alarmed, and insisted on Val entering the office and sitting down.

'I'd no idea, sir,' he said, 'that the news would affect you so.—Let me offer you a little whisky. It's just a sample that I had sent in yesterday.' He opened a cupboard, and produced a black bottle and a wine-glass.

'No!' said Val, waving his hand against it. 'It was so horribly sudden, I was shocked. What has become of—of Gerard Lumby? He was going to be married, poor fellow.'

'Yes,' said Henderson, almost with a relish. 'He was going to wed that handsome lass at the Grange, Mr Jolly's daughter. That's all broken off now, of course. The losses have driven poor old Mr Lumby out of his senses; and they tell me he just sits like a baby and counts his fingers, and they feed him like a child.'

'Horrible!' said Val with a shudder. He felt as if he had planned to break into a house, and heaven's lightning had scattered it to ruin and ashes at his feet. All this news had become quite an old story to Henderson and his companions. The interest had faded out, and it was a pleasure now to renew it by telling the tale to one who was so deeply moved by it. He flowed on, therefore, and told all he knew, and perhaps a trifle more.

'And curiously enough,' he added, when his tale was done, 'we've got a memento of the great commercial disaster here. It came this very afternoon; and if you'll come this way, I'll show it to you.'

Val followed him, incurious. His mind was still deadened by the shock of thoughts which had assailed him at the first. Constance was free, and his guilty plan—for he knew its guilt in the searching light of that moment—was no longer needed. And Gerard, his friend, had not only lost the love Val had meant to steal from him, but had lost all with her—father, fortune, home. Val Strange trembled at that swift and awful blow, and loathed the thought of his own falsity to honour.

The manager led the way from the office to the working chambers of the mill, and halted in a great storehouse with rough-cast walls, where tons of waste-paper lay heaped to the ceiling—vast piles of newspaper returns; whole libraries of worthless books torn from their bindings, and ranged in level rows or thrown in heaps; pyramids of coarse packing-papers, pyramids of lawyers' briefs, parliamentary returns, blue-books, contractors' specifications—a thousand things that had served their turn, or swerved aside from it and fallen useless; and at the edge of the waste, a column of books of unusual size. The binding had been torn from these, and the backs were a tangle of broken string and cracked strips of glue.

'These,' said the manager, 'are Lumby and Lumby's ledgers. I got them for the mill for a mere trifle.' There was a rough table on strong trestles in the room; and Henderson, lifting one of the great volumes, laid it down and turned over the leaves. 'Splendid stuff,' he said, with the paper between his finger and thumb. 'They had everything made to last; and you'd have thought the concern as solid as the hills.'

Val absently took a leaf of the great ledger and turned it over, and looked at the methodical neat entries, column after column. The action and the glance were alike automatic. He had no thought of what he saw. Mr Henderson swelled himself a little with the natural dignity of the showman, and looked on, pleased with his discovery and with its effect upon his employer. A workman in search of somebody in authority, looked into the building, and seeing the manager there, told him of some slight matter which had gone wrong. Henderson, with more alacrity than common, departed to set the something right, and Val was left alone. Turning over the great stiff pages absently, he came upon some papers crushed between the leaves, and mechanically smoothing them, uttered a sudden exclamation. Next he snatched up these papers, and read them at a glance, and laid them down again with his head whirling. A wild surprise and

a terrible temptation reached his mind together, for the papers he had discovered were no other than the drafts made out by Garling in surrender of his booty. A blue foolscap document, written in a stiff and legible hand, lay on the page before him, and Val's eyes swept over these words, clear as print:

'In consideration of the receipt of a written promise to refrain from criminal proceedings, this day handed to me by Gerard Horatio Lumby, I, the undersigned, make confession that I have robbed the firm of Lumby and Lumby, of 107 Gresham Street, of the sum of two hundred and fifty-three thousand two hundred pounds, and do now make full and complete restitution of the same.—EDWARD GARLING.'

Henderson's voice sounded outside, giving final instructions about that trifling something wrong which had called him away; and Val, with an impulse for which he did not care to account, swiftly folded the papers and transferred them to his breast-pocket. His ready instinct told him that while ignorant as to *how* the 'full and complete restitution' was to be made, he nevertheless perhaps held in his possession the key to recovered fortune for his rival and his friend. Constance was free; but how long might she remain free if he handed these all-important papers at once to their rightful owners? The temptation which assailed him in the instant of discovery was not to destroy the papers—for that would have been too gross a crime for him to contemplate—but to reserve them until he had made good his own ground with Constance. In the mere fraction of a second, his mind seemed to take in every side of the case. Gerard had already lost Constance, and by this time had at least recognised the fact, if he had not yet begun to grow reconciled to it. If he, Valentine Strange, succeeded Gerard Lumby as her affianced husband, Gerard Lumby would be no worse off than now; and if, thereafter, he handed over the discovered papers, Gerard would have every reason, comparatively, to be happy. If, on the other hand, he did what his honourable and native instinct prompted him to do, and gave up the papers at once, was there not a chance that Gerard would re-assert his claim, and a chance that the claim would be allowed? Whilst all this and more raged through his mind, Henderson returned.

'You're really looking ill, Mr Strange,' he said, surprised at Val's aspect. 'You'd better let me drive you home.'

No, Val protested; he was well enough—a little startled, that was all. He would walk across the fields. And so, with a brief leave-taking, he was going, when he bethought him of a precautionary measure. 'Don't have those ledgers meddled with, Henderson,' he said. 'I should like to look at them. Leave them as they are.' Henderson promised.—Mr Strange's desire was an understandable whim enough. Val was keen and quick, and had something of that faculty which makes successful scoundrels and great generals: in things that really interested him, he left nothing essential undone. He had not yet decided whether or not to be an utter knave; and if the papers had afterwards to be re-discovered, it would be well to have a reasonable place in which to re-discover

them. What better place could there be than that in which they had been originally discovered? But he had not gone a hundred yards away from the mill, when he returned. Henderson was again mounting his dog-cart, when Val came running back to him.

'On second thoughts, Henderson, don't keep those ledgers. Use them up at once. I can't bear to see them again. Use them up first thing to-morrow.'

Again Henderson promised, and again Mr Strange's desire was an understandable whim enough. How should the manager guess the fight in his employer's soul which resulted in those contradictory orders? Val strode away across the fields rapidly, half-fearing lest he should rescind the order. So weak was he to resist the tempest which tossed him, that before he had again reached the place at which he had turned back, he threw himself on chance to know whether he should finally keep or destroy the ledgers. On that point for the moment he contrived to pivot the greater question—whether he should here and now play the man, or play the knave. 'Heads, I keep them—Tails, they go.' He drew a few loose coins from his pocket. Heads predominated! Fate seemed to tempt him; but a sudden revulsion at the thought that honour should be at the mercy of so poor a chance, sent him along the road again, and he left the great ledgers doomed behind him.

The domestics of his house were used to his comings and goings, and he found all things in tolerable readiness. An hour or two after his arrival, dinner was served up, and he sat down to it with little appetite, and toyed with the dishes one after another, and sent them away scarcely tasted. He had not yet made up his mind, and could not; but over a bottle of Clos de Vougeot and a cigar in his own especial den, he completed the perusal of Garling's entire narrative, and so made himself familiar with the whole circumstances of the case. In that narrative he scarcely knew whether to wonder most at the insolent completeness of the disclosure, or the amazing patience and cunning of the fraud. 'My crime,' 'my fraud,' 'my system of embezzlement,' and kindred phrases, were used with a scorn for periphrasis, and an absence of any affectation of repentance so complete, that the reader's admiration and detestation of the writer seemed to grow side by side. 'I was first led,' wrote Garling, 'to the contemplation of my crime by the ridiculous laxity which left all things in my power.'

'Ah!' sighed Val, laying down the manuscript after re-reading the opening passages, and that amongst them. 'How oft the sight of means to do ill deeds, makes ill deeds done!' He filled his glass again, and sat staring at the fire. There was a vinous glow at his heart, a vinous brightness in his brain. 'I can't associate myself,' said he proudly, 'with a villain of that type. If I hold these papers an hour longer than I can help, I shall identify myself with Mr Garling; an association I have no mind for.' His decision was made at last. Gerard should have his own again, and Val would rely on the justice of Fortune to repay him for this sacrifice to honour. In the glowing warmth with which the generous vintage filled him, he had an easy

presage of victory. Why should he be afraid of Lumby? he asked himself. Constance had never cared for the fellow, but had been persuaded into the match because it was socially a good one. She had cared for *him*—he knew it, though she had not confessed it, and had indeed in self-defence denied it. Taking it altogether, he, Val Strange, had acted very well, and was still acting very well. Lumby could find no reasonable fault with him now. He was genuinely sorry for Gerard's misfortunes, and in his own sense of security, he began to be genuinely glad that he could put a partial end to them. And indeed a quarter of a million sterling might well console a man for the loss of a prospective wife. Not in his own case, of course. That would have been an absurd suggestion. Val, never having felt the want of money, had a noble scorn for it. He threw it about with a splendid recklessness and royal prodigality, though he never spent a quarter of his income, being innocent of expensive vices, and despising the card-table and the turf. But Gerard was poor, and the return of the money would compensate for much to him. And be that as it might, by all rules of love Val had a perfect right to try his fortune now.

He rang the bell, and the old butler answered the summons. 'My yacht,' said Val, 'is lying about three miles this side of Daffin Head. Supposing this'—indicating the bottle—'to be the paper-mill, and this'—indicating a cigar-box—'to be our present position, the yacht is here;' and he set down his wine-glass in a straight line beyond the bottle. 'As straight beyond the mill as you can go. You understand?'

'Yes, sir,' said the butler. 'It'll be in Quadross Bay.'

'That's it,' said Val. 'I had forgotten the name of the place. Send one of the fellows to the yacht in the morning to tell Richards to pack my things and come up at once. Have him here by half-past nine at latest. I am going up to town in the morning.'

'Very good, sir,' returned the butler, and retired.

Jim the groom being charged with the commission, saw his way to an unauthorised enjoyment; and putting dogcart and horse together at once, drove to a certain hostel within half a mile of the little bay, and there meeting some of the yacht's crew, went aboard with them, and held high revel until one in the morning, by which time his master, with a comfortable sense of virtue on him, had just turned into bed. Jim the groom reappeared in due time with Val's body-servant and divers portmanteaus; and away went Val, body-servant, portmanteaus, and all, up to London, by earliest train from Brierham Station. He had learned from the butler that the Grange, like the Hall, was empty. He had no immediate means of learning Constance's whereabouts, but that could not be a difficult matter in London. Her father and her brother were probably at the Albany as usual, and there was Miss Lucretia to apply to. But first, with a feeling of magnanimity and honesty in his bosom which was refreshing after his late self-accusings, he sought his lawyer, and from him obtained the name and address of the legal adviser of the late firm of Lumby and Lumby. The legal adviser, who was a high-dried little man, extremely old, and dry

and wrinkled, was by no means so sanguine of the restoration of the property as Val had been.

'Mr Garling,' he said, in explanation of his doubts, 'has gone to Spain. The police can tell you so much about him. It is very probable that this is so much waste-paper after all, giving us merely the melancholy satisfaction of knowing the truth. The English and continental journals gave news of the failure of the firm and of Garling's flight, with some supposed enormous gains; and it is quite on the cards that he may have renewed his hold upon the money—quite on the cards.'

At this view, Val became so evidently depressed, that the lawyer proposed to set an end to doubt at once by a visit to the Bank and a telegraphed inquiry to the bankers at Madrid. Val assenting eagerly, the high-dried little man got into a cab with him and drove away without loss of time. Then again Val produced the wonderful papers and told his tale. The manager having heard it through with great astonishment, wired at once, and promised to despatch a messenger with tidings of the answer. Val arranged to call upon the lawyer at the hour of six, and went upon his own inquiries. First to the Albany, where he learned nothing. Mr Jolly and his son were out of town, and since they had left no instructions for the forwarding of letters, were not expected to be long away. Next he repaired to Chesterfield Street, Mayfair, where Miss Lucretia's house was found deserted. Val knocked and rang, refusing to believe that his quest had ended in a no-thoroughfare; and at last, disheartened, got into his cab again, and was driven to his own chambers. Emerging thence, he took another hansom, and drove wildly about town, calling on everybody he knew to whom Reginald was known. He gained no more by this move than by the others. Streets were 'up' on all hands; the faces of the houses were given up to the painters, and the pavements were planted thickly with scaffoldings and ladders. Nearly everybody was out of town, and Val met nobody who could give him the information he wished for. By the time at which his unavailing search was ended, he was due at the lawyer's, and hastened thither.

'No answer from Spain, yet,' said the lawyer in response to his inquiries. 'I have received a message from the manager, who promises to send me the news when it comes. It will be forwarded to him at his private residence, and he will wire to me. Will you wait?'

Val answered in the affirmative, and sat down. The minutes glided slowly by, more slowly than he had ever known them glide. Twilight began to fall; and the lamplighter, visible from the window, travelled round the square, leaving the lamps agleam behind him. The clerks had gone already; and the lawyer, having lit the gas and drawn down the blinds, sat with his parchment face bent over a parchment deed, and read and read, making pencil-notes in a book at his side, but never looking at the hand which wrote them. This proceeding getting to have something of an eerie look at last to Val's eyes, and an eerie effect upon his nerves, he begged leave of absence for a quarter of an hour.

'I shall be here for another hour at least, now that I have begun this,' said the lawyer. 'Go and dine by all means. Take your time.'

Val let himself out, and stumbled down the dusky staircase. He did not care about dining; but, cigar in mouth, paced up and down the flagged border of the square, keeping watch upon the lawyer's door. After half an hour or so, he grew tired of this, and returned. The man of law admitted him, and set his parchment face above the parchment deed again. The place became so silent, that Val could hear his own watch ticking. An hour went by drearily, and the parchment being done with, was folded, put into a tin case and locked up in a tin box, and the lawyer lowered his lamp. 'Something the matter with the wires,' he said composedly. 'Suppose we give them to half-past nine. What do you say?'

Val said 'Yes' to that; and they sat on in silence.

'Do you mind this twilight?' asked the old man, after a great gap of time had been crossed. 'It rests my eyes.'

'Not at all,' Val answered; and again they sat in silence. Rumours of the life of the streets reached them now and then; at times a footstep coming nearer made the watchers prick their ears and listen; twice a footstep paused outside and went on again. At last, upon the very limit of the time, and when the lawyer had already reached out his hand for his overcoat, the sound of a hurried footstep and a cheerful whistle coming near arrested it. The outstretched hand changed suddenly from its first intent, and without moving a muscle, enjoined silence. The step paused before the outer door, and the whistle ceased; and then, as though paid in proportion to the noise he made, and wildly anxious to increase his salary, the owner of the step plunged up-stairs and battered at the door. The old man responded, received a telegram, turned up the lamp, put on his spectacles, opened the envelope, all with aggravating slowness, drew forth the inclosure, and read it. Then suddenly flashing from an old man to a young one, he strode across with outstretched hand and slapped Val on the shoulder.

'You have done it, sir! The money is safe. That scoundrel hasn't got it, after all.' The parchment face was flushed, and the old eyes were moistened. 'I didn't dare to hope it,' said the old fellow. 'I declare, sir, I am as much rejoiced as if the money were my own!'

LITERARY COINCIDENCES.

WHAT is plagiarism? Among all the questions connected with literary criticism there is perhaps none to which it is more difficult to give a satisfactory answer. Of course it is easy enough to define plagiarism in the abstract as a form of theft, the things stolen being thoughts, phrases, images, and the like; the difficulty is to decide whether in this or in that case the offence has really been committed. Sometimes the evidence for the accuser may be obviously too crushing to be set aside; such as when a sermon or an essay or a poem which professes to be the work of one man is discovered to be identical, sentence for sentence and word for word, with the pre-

vious work of somebody else. In such a case, it is tolerably clear that deliberate 'conveyance,' as Pistol loved to describe it, must have been practised by preacher, or essayist, or poet number two. Literature is, however, full of duplicates the existence of which cannot by any means be so readily explained. Some thoughts have a trick of turning up again and again in the same kind of dress, and though sometimes the similarity of costume is so marked as strongly to suggest a suspicion of literary larceny, the kindly critic is generally free to believe either that the reproduction has been unconscious—a vague reminiscence having been mistaken for an original idea—or that the correspondence is altogether fortuitous, and that two minds have hit not only upon the same thought, but the same form of expression, while working in entire independence of each other.

There are ideas so obvious, that no one can be surprised to meet them again and again; and certain methods of putting them are so natural, that it is clearly unfair to affirm that the last sayer is necessarily a plagiarist. For example, the thought that well-doing is in itself a happiness and a satisfaction to the well-doer, without any regard to accompanying pleasure or profit, is a truth likely to be expressed at some time or other by any man who has a real sympathy with goodness; and there is nothing to wonder or to cavil at when we find it enunciated by different writers in very much the same language. Henry More, in 'Cupid's Conflict,' says that 'Virtue is to herself the best reward;' Dryden, more tersely, in his 'Tyrannic Love,' tells us that 'Virtue is her own reward;' and, with the simple change of the pronoun from 'her' to 'its'—the form in which the thought has attained general currency—he has been followed by Prior in his 'Imitation of Horace,' by Gray in his 'Epistle to Methuen,' and by Home, in whose drama of 'Douglas' the familiar phrase again makes its appearance. We say the 'phrase' advisedly, for the idea itself is constantly appearing, and is expressed nowhere with greater felicity than in the little poem by Mr Tennyson entitled 'Wages,' which appeared in *Macmillan's Magazine* about twenty years ago, and has been republished in the later editions of his works.

There has always been a controversy between the pure theologians and the pure moralists; hence, when Pope wrote—

For modes of faith let graceless zealots fight,
His can't be wrong whose life is in the right:

he doubtless expressed, in his usual terse epigrammatic way, what had often been thought by previous speculators; but every one does not know how nearly even his mere phrasing had been anticipated by Cowley, who, in his lines on the death of Crashaw, a contemporary poet, apologetically remarks:

His faith, perhaps, in some nice tenets, might
Be wrong; his life I'm sure was in the right.

In one of his 'Epigrams,' Pope was himself the originator of a thought which was afterwards appropriated by Cowper. The former wrote:

You beat your pate, and fancy wit will come;
Knock as you please, there's nobody at home;

while the latter, in his poem 'Conversation,' has the suspiciously similar couplet :

His wit invites you by his looks to come ;
But when you knock, it never is at home.

It is not often, however, that we encounter so awkward-looking a parallelism as this ; and critics in the detective line of business, who are never so happy as when they think they have caught a writer in the act of decking himself with borrowed plumes, are generally content with evidence of a much weaker order. No literary man of our own day suffered more than Alexander Smith from these policemen of the press, who, like their prototypes in blue, seemed to think that their promotion depended upon the number of convictions they could secure. Some of the instances they collected had of course a more impressive look than others, and gave an air of respectability to the prosecution ; but the attempt to prove Smith a mere literary shop-lifter was a miserable failure. Perhaps one of the most striking hits was the discovery that while the Scottish poet had written of

The torrent raging down the long ravine,

Mr Tennyson had some years previously published the very similar line :

The long brook falling down the cloven ravine.

It is very probable that this was really an instance of unconscious reproduction ; but even supposing that Tennyson's line were consciously present to Smith's mind at the moment when he wrote his own, his offence was not one which called for any great display of critical severity. Sir Arthur Helps, in a cordial consolatory letter which he addressed to Smith, said very happily, that 'really, if people were at all critics, they should be able to distinguish between the man who *conquers* and the man who *steals*.' The so-called plagiarism just quoted is surely an example of conquest rather than of theft. With all respect to Mr Tennyson, whose poetical position has long been assured, one may express an opinion that the later line is stronger and more picturesque than the earlier one. The words 'torrent' and 'raging' harmonise better with the idea of a ravine, which we naturally think of as rugged and precipitous, than the tamer 'brook' and 'falling.'

Mr P. P. Alexander, in the appendix to his interesting biographical sketch of Smith, points out another instance of this kind of conquest ; and very truthfully remarks, that 'in adopting an image from a previous poet, and in so doing ennobling it, as much genius may be shown as in the invention of an original image.' Keats in one of his poems speaks of a

Gold vase embossed
With long-forgotten story ;

and one of the characters in Alexander Smith's 'Life Drama' tells how

An opulent soul
Dropt in my path like a great cup of gold
All rich and rough with stories of the gods.

Who does not see how much more of fullness and distinction there is in the image of Smith than in that of Keats ?

Enough has been said of this one victim of

unfair criticism. No one whose opinion is worth anything believes in the validity of the charges made by the irresponsible, if not exactly indolent, reviewers ; indeed, Mr Alexander in his elaborate defence of his friend, proves that by the use of their method almost every writer of eminence might be shown to be a systematic thief. He points out that Burns's lines—

An' my fause lover stole the rose,
But ah ! he left the thorn wi' me,

find their original in Shakspeare's 'All's Well that Ends Well,' where Diana exclaims :

Ay ! so you serve us
Till we serve you ; but when you have our roses,
You basely leave our thorns to prick ourselves,
And mock us with our bareness.

He shows that just in the same way as Smith was supposed to be indebted to Keats and others, so Burns might be supposed to be indebted to Shakspeare. In the same sense, Tennyson has been indebted to Burns and to Hogg, Wordsworth to Milton and even to Byron, Browning to Shelley, and almost every great poet to some predecessor. The whole controversy is a childish one. If a new writer has anything to say worth hearing, there is no reason for our feeling injured should he happen to clothe his thought in phrases that remind us of some mighty master. Absolute originality of the kind demanded by superficial critics would not please us even if we could get it ; it would fail to move us, because it would never touch the electric chain of familiar association ; and would prove not the greatness of the mental power of its producer, but rather his vanity, conceit, and utter want of reverence for the past. This is particularly true in the realm of poetry, from which almost all our illustrations have so far been drawn ; the fact being, as Arthur Hugh Clough puts it, that 'poetry, like science, has its final precision ; and there are expressions of poetic knowledge which can no more be re-written than could the elements of geometry. There are pieces of poetic language which, try as men will, they will simply have to recur to, and confess that it has been done before them.'

A later writer remarks, with special reference to a charge of plagiarism from Shakspeare, that the great dramatist 'belongs to us all. Whenever he expresses a thought, his expression becomes a part of the thought ; and if we take the thought, we must needs take it in Shakspeare's clothing, for no other will fit.' These passages without doubt tell the truth concerning a matter about which there is a great deal of careless thought and writing. We are all of us indebted to our predecessors, and the men who contribute the greatest amount of new material to the common stock are always the first to be accused of plagiarism, because they boldly and honestly confess their indebtedness. They do not, to use Sheridan's words, 'serve your thoughts as gipsies do stolen children—disfigure them to make them pass for their own ;' they let them stand as they find them, and the small critic has no difficulty in swearing to the identity of the conveyed property.

The deliberate thief is too clever a person to be caught so easily as this. The literary watch-cases and silver-spoons which he purloins are

always sent to the melting-pot and made unrecognisable before they are permitted to be seen in his possession; but they have generally lost so much in the process, that the recovery of them is a game which is hardly worth the candle. The theft which is a theft indeed is probably to be discovered in the chapter or sentence which is generally supposed to be the most original in the book where it happens to be found.

Though a hunt after plagiarisms is a fruitless sort of business, it is very interesting, and not altogether unproductive, to gather together the parallelisms and coincidences of which literature is full, and which seem to hint at some law of mind in virtue of which a given thought naturally clothes itself in one particular dress, and a given relation between two things tends to suggest some one image. We take two of the passages just quoted, and we easily find their duplicates within the range of our own reading. Clough, as reported above, says that 'there are expressions of poetic knowledge which can no more be re-written than the elements of geometry;' and the other day, when re-reading Emerson's essay on Art in the volume entitled 'Society and Solitude,' we came across a sentence in which he affirms that 'good poetry could not have been otherwise written than it is.' No one would accuse Emerson of plagiarism; but here Clough certainly anticipated him; and Sheridan's figure was in like manner anticipated by Churchill, in whose works we find the couplet:

Like gipsies, lest the stolen brat be known,
Defacing first, then claiming for their own.

In Emerson's poems is to be found a parallelism more generally recognisable than the one given from his prose. We are all familiar with the line in which Wordsworth declared that

Nature
Never did betray the heart that loved her;

and in the 'wood-notes' of the American poet-philosopher we read:

For Nature ever faithful is
To such as trust her faithfulness.

Wordsworth himself, indeed, poetical innovator as he is, now and then becomes a reproducer; and one instance of his reproduction is so striking, that one wonders it was not pounced upon by some of his ferocious contemporary critics. Both Milton and Wordsworth use the phrase 'married to immortal verse,' the one in 'L'Allegro,' the other in 'The Excursion.'

Just one more instance we shall give. In Herbert's collection of maxims, published under the title of 'Jacula Prudentum,' there is included the beautiful proverb which tells us that 'To a close-shorn sheep, God gives wind by measure.' This proverb was adopted and improved by Sterne, from whose 'Sentimental Journey' we learn that 'God tempers the wind to the shorn lamb'—a form in which the proverb has passed into the inner sanctuary of our religious thought.

A collection of parallelisms such as the above might easily be extended to the dimensions of a volume; but it would be curious rather than valuable, for the psychological law which these things illustrate betrays itself as clearly in a

score of instances as in a thousand. That the likeness between men's minds is more striking than the difference, seems to be the fact which is hinted at by the greater number of these literary coincidences; and if we are right when we say 'Many men, many minds,' we are equally right when we say 'Many men, one mind;' for it can hardly be doubted that the great American thinker from whom we have already quoted announced a great truth when he spoke of a supreme reason which we do not possess, but by which we are possessed—an 'over-soul' which is the common intelligence of mankind, and which at times, through various mediums, utters duplicate messages, not merely identical in substance, but nearly so in form and expression.

PLAYING THE WRONG CARD.

IN FOUR CHAPTERS.—CHAPTER III.

THE good people of Fieldenham were advised by printed bills, that owing to circumstances over which the manager had no control, the entertainment announced for the second night would not be given. The townsfolk bore this disappointment with great equanimity. The day was marked with a white stone in the memories of Professor Regaldini and Mademoiselle Lucile—to recur once more to the dignity of professional names—for, on the strength of the windfall which had dropped so unexpectedly in his path, the former treated his little friend with an excursion to a very famous spot some few miles from the town. If the scenery from this point was scarcely appreciated at its real worth by the pair, so much could not be said of the cakes and syllabubs for which the resort was so noted.

On their return, which was in time for early tea, the Professor was in time to see his coadjutor set forth on his errand, duly prepared for the impersonation of this unknown foreigner. It had indeed been arranged that Styles should return in time to see Charley and give his opinion. The latter was first to call at Myrtle Villa; and then, if his assumption were pronounced satisfactory, he would proceed at once to Elms Knoll. Styles—we find we have descended again to the prose of real life—was anxious to see his friend in character, not only to give his opinion as to its success, but to aid him by suggesting some improvements—suggestions which his own experience would render valuable.

Mr Charles was sitting in the little parlour at their lodgings, his back to the light, and leaning his head upon his hand in a thoughtful attitude. Mr Styles stepped briskly into the room, hesitated, faltered out two or three doubtful words; then Charles looked up and smiled.

'My eye!' exclaimed Styles. He was almost speechless from astonishment, envy, and admiration. He drew a long breath, and repeated his ejaculation: 'My eye! How you *do* mug up, Charley! You might go through this town, ah! if you owed money in every shop, and I don't believe a soul would know you.'

'It is good, then?' said the musician.

'Good!' repeated the other. 'It would puzzle your mother and father to swear to you. And what's more extraordinary than all, Charley, is

that you have hit on just the expression of that photo.'

'You think so?' asked the musician again.

'Think! my boy! It's a certainty!' almost rapturously exclaimed Styles. 'Of course it's an accident, a lucky accident; but I don't believe—I really don't, Charley—that I could have made you up better myself, if I had been here.'

Charles smiled his quiet meaning smile again, and after receiving some further congratulations, started on his errand. Mr Styles, in the fullness of his admiration, was anxious to show Lucile so splendid a 'make-up,' that young lady being quite as good a judge of such matters as her elders; but it appeared she had gone out with the landlady. Mr Styles was vexed at this; for, as he said, the girl might never have such another chance.

A very few minutes sufficed to take the musician to Myrtle Villa, where, on inquiring for Mr Hythe, and giving his name as Mr Carlos Villada, he was shown into the presence of that gentleman, who was of course expecting him to call.

'Pray, be seated, sir,' said Mr Hythe, as his visitor bowed. 'I have not the pleasure—I think—of knowing you. May I ask what you wish to see me for?'

The face into which he was looking as he spoke, gradually changed in expression; a familiar light played in the eyes, and the lips curved into a smile.

'Is it possible?' exclaimed Hythe. 'Well did your friend say that I might safely intrust the business to your hands, for the transformation is wonderful. Let me hear if you quite understand the history; if you do, all the rest is safe.'

'I am fully certain of the business,' returned Charles. 'There is no merit in that, for all is so simple. Your brother having been foolish enough to throw himself away on a foreigner—contemptible and worthless of course—justly punished her presumption in allying herself with the respectable English, by deserting her. That she was left in a strange country with an infant helpless, only made the position more disagreeable for your worthy brother; yet now he weakly repents of his conduct; and if not judiciously taken care of, he will squander much money on this foreign person's memory, to the detriment of his family. That is not respectable—not English! If the foreign person did not die, she ought to have died.—Am I right so far, sir?'

'You are right so far,' returned Hythe with a good deal of emphasis; 'you are perfectly right, sir. But, whether it is from your not being thoroughly acquainted with our language, or not, I can't say, you put the matter in as disagreeable a light as possible.'

'Pardon. I am very wrong, no doubt,' said Charles with a bow. 'It must be as you say, because I have had acquaintance with the English language. Well, sir, then I have to see Mr Maurice Hythe, tell him I am the relative of this foreign person, whom he married under the name of Wilstone'—

'Why, confound it! I did not tell you that last night!' interrupted Hythe.

'Tell me what, sir?' asked the other, with another smile; he smiled each time he spoke.

'Why, I did not tell you the name under which he married,' continued Hythe. 'I know we talked about it; but I have been trying to manage without explaining that point.'

'Well, sir,' replied Charles, with another smile and a shrug of his shoulders, 'if you did not tell me, how shall I know? Consider, sir, and without doubt you will recall what you say to me in this very room, just before we leave you.'

'I suppose it was in this room, if anywhere,' growled Mr Hythe; 'and now you mention it, I seem to think we did refer to it again. Well, I must have told you, and forgot about it; and was a fool for telling you, that is all.'

'That is all, certainly,' assented the other, with a cheerful, satisfied smile, as though he had just confirmed the speaker in the most flattering of assertions. 'I tell him, then, that the foreign person is dead. I shall tell him, as you advise, that she marry again, and live happy; that she tell me all about it, and ask me to find him if I ever go to England. To explain how I know him, I shall say I have find a letter addressed to him in his right name; I say this was among the foreign person's papers, and she think it refer to some one else. I think not—so I keep it, and see. I have find him by this; and now I find him, I tell him the person dead, and her baby dead too; that after he desert them, and she marry, she live seven years, and—I think this very fine point—she ask his forgiveness for having married again. Being, as I learn from your description, a gentleman of very honourable and sensitive feelings, easily moved to pity, and so on, I should think that would be very effective. Do you not agree?'

'Yes,' returned Hythe, after a pause, during which he had eyed the musician with a look of no great admiration—'yes, that will do. In fact, Mr Charles, or whatever your name is, you may say and do what you like, for it's my belief that the Evil One himself could not hold a candle to you.—That's plain speaking.'

'Ah, sir, you flatter me,' returned the musician. 'Yet, after all, it is but natural. We foreigners are cunning and deceitful, I know. I know it well; I have heard it said five hundred times since I have been among the English. Alas! it is our misfortune; we cannot equal their truth, their candour, their faithfulness. Certainly not! Well, good afternoon, sir. I shall now present myself to the Elmees Knoll, and hope to have much agreeable interview with your brother. Adieu, sir.'

Saying this, the musician bowed himself out, a good deal to the relief of Mr Hythe, who drew a long breath as he disappeared, and exclaimed in an undertone: 'Confound the fellow! I hate him worse every moment I am in his company. I compared him last night to a hyena. Some crawling poisonous snake would be more like him, to my thinking now. But he is just the man I want, for all that.'

The musician, on leaving Myrtle Villa, did not follow the high-road on his way to the Knoll, although this was the nearer, but took a somewhat devious path which led across the fields; and by the stile which bounded this path, and separated it from the main road, he found seated on a bench under a tree, evidently awaiting him, his landlady

and Lucile. With scarcely a word, he took the girl's hand and led her away, pausing, however, after crossing the stile, to make certain that the landlady had really gone back, and was not lingering to watch them. Apparently the girl was used to his silent mood, for she accompanied him without question until they reached the Elms Knoll gate. This the musician opened unhesitatingly, and went quickly towards the house. Some large shrubs stood outside the chief door of the building, so large and so close that it was impossible for any one in the house to see a person sheltered by them even if the door were opened. At the brief direction of her conductor, the girl stood quietly behind the trees while he knocked at the door, which was promptly opened by a maid-servant. In answer to the visitor's inquiry, he was informed that Mr Hythe was within. Giving his name as Mr Joinville, the musician requested the favour of a few minutes' interview on business. The maid civilly asked him to enter; but the musician preferred to wait where he was, until her return. When she did return with a message to the effect that Mr Hythe would be happy to see the gentleman, the servant was startled to see a girl standing by the visitor's side. 'May I ask the favour of the young lady being allowed to wait in the house until I have spoken to Mr Hythe?' said he.

'Certainly, sir,' replied the maid. 'I did not see the young lady at first, so did not mention her to Mr Hythe.'

'That is of no consequence,' returned Mr Joinville. 'If you will kindly take her in your charge, and let me know where I can find her in case Mr Hythe should desire to see her, I shall be much obliged.'

This was soon arranged; Lucile being taken into a parlour on the ground-floor, which doubtless served as the housekeeper's sitting-room, for here she found a middle-aged lady, to whom the servant paid much deference.

The musician was ushered into a library, where, surrounded by a chaos of papers and books, sat the worn, enfeebled figure of the master of the house. He looked up with an air of some curiosity as his visitor entered; but the weary, disappointed expression so common to his features, was not brightened or changed. The man was a stranger.

'You wished to see me on business, Mr Joinville,' he began; 'so I understand from the servant. Is it?—'

'Excuse the interruption, sir,' said the stranger; 'but my name is not Joinville. I sent that in, being my professional name, thinking you might probably have heard of me as a musician.'

Mr Hythe shook his head with a slight, sad smile.

'It does not greatly matter,' said the other, seating himself in compliance with a gesture made by Mr Hythe, 'as my business here has certainly no reference to professional affairs.—I believe, Mr Hythe, you were married abroad, about twelve or fourteen years ago, to some foreign girl. Lucia, her Christian name was, if I am right.'

Hythe roused himself, and gazed with mingled surprise and alarm at the speaker; 'I was. Is your business connected with that?'

'Finding yourself saddled with a wife for whom you had ceased to care—quite properly, I grant—'

and burdened with an infant whom you hated, as interfering with your prospects in England—quite properly on your part, I again grant, you left them to their fate in a country which was as foreign to them as to yourself'—

'You misunderstand, if you do not misrepresent what occurred,' interposed Hythe. 'I have borne with your comments so far, as you are the first man who has ever spoken to me concerning that painful period of my life. I own my wrongdoing; I bitterly regret it; I would give the world to restore the wife and child I lost. But my conduct was not so inhuman as you describe it.'

'Well, no; I daresay not—from your view; from what I perceive is the respectable, and therefore the British view of the case,' returned the other, in unmovable accents. 'But I believe the foreign girl had a different impression. She was of a violent temperament, as these foreigners, who know no better, often are; and she eventually hated you with an intensity equal to the fierceness of the love she bore you at first—women, you know, are always in extremes—and she cursed you in her dying hour.'

'Impossible!' cried Hythe. 'Badly as I behaved, she would never have done that. But even if she did, how could you have known it?'

'You will hear, sir. To tell you what I know, and how I know it, is my business here,' said the stranger, dropping his half-mocking tone for one of greater earnestness. 'She had friends, but they were at a great distance. Robbed by those among whom you left her, she made her way under great privations, and through such trials and hardships as ought never to have fallen to any woman's lot, especially to one so dearly loved and tenderly nurtured as she had been. Among her relatives, Mr Hythe, she had a brother—a brother, who would have given his life to have saved her; and to him she came. He first believed she had erred, as women have erred too often; but he received her with his kindest love even then; and when he learnt the truth, he felt—But you shall hear more of his feeling presently. Her privations and her trials killed her; she died in his arms. To him she told her story; to his care she left her unprotected child. To him, also, she bequeathed her betrothal ring—a diamond which I here submit for your inspection.' He drew a ring from his pocket as he spoke. 'To him she intrusted her revenge. He was poor, very poor, sir, although not always had he been so; yet he resolved to visit England, and to spare no trouble to find out this man, and avenge his sister. He kept his word; he came to England accompanied by the child—your daughter.'

Hythe started, breathed quickly, while the gaze he fixed on the speaker's face grew wilder and more intense.

'You have, I believe, seen a portrait of this brother,' continued the musician; 'given to you by your wife. She was a foolish, trusting girl, as you too well know, and loved her brother dearly. His name, as you must often have read on the portrait, was Carlos Villada; he it is who is now in England—he it is who now speaks to you. I am Carlos Villada.'

Hythe thrust back his chair, drew a long breath, and fixed his eyes resolutely on the

stranger, as though expecting some violent movement.

'Oh, fear me not, sir!' exclaimed the musician, or Villada as we may now call him. 'It is true that I sought England to be my sister's avenger, and that, baffled by your change of name—you were Mr Hildred Wilstone in those days, you know—my search was unavailing, until an accident discovered you at this obscure town; but I find my purpose practically achieved. I have heard enough of you to know that your greatest punishment will be to live—to live consumed by remorse, and the unavailing desire to atone for the injury you have inflicted; a desire and remorse which shall be a hundredfold bitterer to you when you know how nearly it has been in your power to repair the wrong you have done. Yes; when you shall once, for the last, the only time, have seen your daughter, your only child; when she leaves your sight for ever, having once stood under the roof of your accursed house'—

'Under my roof! Is she here now?' cried Hythe. 'I do not doubt your story; I believe it, and will forgive all you have said, if you but tell me she is here!'

'You have your wish, sir, for she is here, and you shall see her,' returned Villada. Then rising, he opened the door of the room and called Lucile. The girl came at once; and the musician taking her hand, led her into the apartment. 'This, Mr Hythe,' continued Villada, 'is the daughter of the foreign person who called herself Lucia Wilstone. Does she resemble her?'

'Herself again!' gasped Hythe. He strove to rise from his chair, but sank back, and clasped his hands for a moment before his eyes. 'An instant,' he said, 'and I shall be myself again. Had you shown me one from the dead, you could not have thrilled me more!'

'You are satisfied, then?'—began the musician. 'I am.—Lucia! come to me! Let me beg a mother's pardon through her child,' entreated Hythe.—'You will not, cannot dream of taking her away?'

'She leaves your presence now, and for ever!' was the harsh return.

'She shall not! She is my child, and I dare you to remove her.—Lucia! I am your father! Come to me, my child.—I will not be stopped!'

Villada had thrown himself before the girl, and now thrust Hythe back with such force as to stagger him.

'Let the gentleman come to me, Carlos!' exclaimed the girl, speaking for the first time. 'I am sure he does not wish to harm me.'

'My child—my dear child! I am your father—your most unhappy father!' cried Hythe.—'Stand aside, sir!—Help!'

A brief struggle accompanied these exclamations, which, from the vengeful expression on the stranger's face, might have had some terrible termination, but the broken strength of Hythe gave way, and he fell unconscious into his chair. A glance was sufficient to assure Villada that he was really insensible; then grasping the child tightly by the wrist, he led her from the room and the house, telling the servant who opened the door that he thought her master was unwell.

The shadows had gathered; twilight was past

and gone, and night had come, while Mr Styles sat at the little parlour window of Back Church Row smoking his pipe, and looking anxiously for the appearance of the musician with the girl; for the landlady having returned without the child, had been obliged to tell how she had parted from her; and, to quote exactly from the current of Mr Styles's reflections, that gentleman was 'blessed if he could see what sort of game Charley was up to now. In fact, when you once got in with them foreigners, there was never any telling what would come of it.'

While sufficient light remained for him to distinguish figures at the corner where Back Church Row joined the larger thoroughfare, the Professor sat at the window and watched; but at last with a sigh, he drew down the blinds, turned away and lit the gas. He had not done this three minutes, before a knock was heard, a knock he well knew; and the next instant the musician entered, leading Lucile.

'I am glad to see you both,' exclaimed Styles; 'for I have been fancying all sorts of things.—Well, is it all right? Have you managed the business and got the money?'

'Money! Ha, ha, ha!' laughed the musician. —His laugh was so strange and wild, that Styles started and changed colour.—'Money! Better! I have had revenge! I have seen your Maurice Hythe, and he has seen me. He has seen the brother of the woman he deserted! He has seen her child—his child. I have left him to live! The miserable wretch is to live! Her brother has spared him—to live!'

'Yes, yes; I know,' said Styles uneasily. 'You were to represent her brother, of course; but in reality, did you?'

'Represent!' cried the other. 'Talk not to me of represent. I scorn and throw away all your poor plays and acting grimace! I have done with them for ever! We say farewell! We leave you for ever!'

'Are you mad?' exclaimed Styles, seriously alarmed by his associate's manner. 'Where is the twenty pounds? And what is the use of your talking about leaving me, when we are to open at Bingleton to-morrow, and when Lucile is articulated to me?'

'I leave you, Styles; Lucia leaves you,' continued the musician. 'We laugh at your articles; we laugh at your towns of Bingleton. We are revenged, Styles; that is enough! All is settled; we go.'

'But you can't—you shan't go like this!' exclaimed the hapless Professor. 'What am I to do? I can't keep my engagements; you must not!'

'Styles! Señor Styles,' said the other, dropping his voice, and speaking in a low, penetrating tone, which the Professor instinctively felt was dangerous; 'you will remain with your pipes and your beers, if you are wise; for if you hold out a hand to stay me, I will cut that hand off at the wrist; and you know it; I see you do. Ah! You will be careful of yourself, and run no risk. That is well!—Come, Lucia—Lucile no more. We quit for ever this wretched mimicry.'

'But where are you going with the child?' said Styles. 'You have no money. How will she live? Where will you take her?'

'Fate will decide,' replied the musician; 'our destiny may lie in this world or in the next. We go to fulfil it, whatever and wherever it is.'

And with this they were gone.

QUEER CASES.

BY A SURGEON.

IN TWO PARTS.—PART I.

THE old adage, that truth is stranger than fiction, is seldom verified in a more marked manner than by the annals of modern surgery. In these days of extirpation of spleens and kidneys, of skin-grafting—when not only new noses, lips, and eyelids owe their origin to plastic operations, but even artificial windpipes, are attempted by chirurgical art—the prophecy of the American humorist, that we shall shortly go into a shop and get measured for a new set of 'works' with as much nonchalance as we now order a suit of clothes—to say nothing of false teeth and glass eyes—is not so very wild after all, looked at by analogy. In the following papers, I propose to relate some curious incidents and accidents of surgical practice, which, although on record in the literature of the profession, are not generally known to the public. Those instances in which no authority is quoted, have either occurred under my own observation, or have been related to me by various surgeons of eminence under whom I studied, as having happened within their personal experience.

When I was a student at St George's Hospital, a man was brought in one night with a compound fracture of the thigh-bone—that is to say, the bone was not only broken but exposed to view through a wound in the skin—a very serious state of affairs. He had been detected by the police in the act of stealing lead off the roof of an empty house in Pimlico; and being surprised and chased, had dropped into an area, and sustained the injury which occasioned his removal to the hospital instead of a police station. An unsuccessful attempt was made to save the limb; amputation was then performed; and after lingering some weeks, the patient died. So far there was nothing in the case to call for remark; but after death, a curious fact cropped up. This was the discovery, at the *post-mortem* examination, of a rough jagged piece of lead, weighing several ounces, in the stomach, which could not possibly have been swallowed after his reception into the ward. It must have been bolted by him in the fright and confusion of the chase, or possibly, may have been bitten off a larger fragment in his agony while he lay in the area; but however that might be, its presence had never been suspected; the man had never mentioned it; and it had set up no symptoms while he was under treatment. It is now preserved in the Museum of the Hospital, side by side with the famous half-sovereign which got into Brunel's windpipe, and which was extracted by Sir Benjamin Brodie by means of an operation, combined with the action of a swivelled table designed by the sufferer himself.

Some years ago, a poor woman was discovered lying dead on the floor of her room in a low part of Westminster, with such marks of violence upon her body—notably a deep longitudinal cut on

the head, which had incised the bone of the skull itself—as to point to the conclusion that she had been the victim of foul-play. Her husband was taken into custody, and put upon trial for murder. In making his defence, he accounted for the bruises, blood-stains, and other collateral evidence in various plausible ways; and for the scalp-wound by showing that the room was an attic with a broken skylight in the roof, and insinuating that a sharp-edged piece of glass must have fallen on his wife's head as she stood underneath. The surgeon who had been called in to view the body, in giving his evidence expressed his opinion that a piece of glass in falling would not have sufficient force to cut into a bone. Notwithstanding this and other facts tending to prove that there was no moral doubt as to the guilt of the accused, the balance of legal testimony against him was not strong enough to convict, and he escaped. The surgeon—long since risen to the top of the professional tree, and now a man of European reputation—was at that time curator of an Anatomical Museum, where, in the department devoted to Zoology and Comparative Anatomy, stood the skeleton of a cow. A few weeks after the trial above quoted, a violent thunderstorm, accompanied by hail, burst over London one night, and much damage was done; amongst other things, the Museum skylights were extensively shattered. When the curator arrived next morning, he found a spiculum of broken glass actually sticking upright in the very edge of one of the sharp prominences of bone—technically, the *spinous processes*—projecting from the vertebræ of the cow! I have often heard him narrate the incident at lecture, as a warning to young men against conclusions jumped at on the strength of preconceived ideas, instead of patient investigation and experiment. The wound in the woman's skull *might*, after all, have been produced by falling glass.

A lad was once admitted into St Bartholomew's Hospital upon whose head a brick had just fallen from a considerable height. He was wounded, bleeding, and insensible; and an examination with the probe revealed 'exposed bone'—that is, yielded the rough grating sensation characteristic of the head-bones from which the covering membrane has been rudely stripped. But there was no apparent fracture or depression of the skull, and the medical men were at a loss to account for the marked symptoms of compression of the brain, which became more and more apparent every minute. These grew so severe at length that it was determined to enlarge the wound in the scalp, and inspect the parts beneath. This having been done, the mystery was explained at once. A corner of the friable brick, pyramidal-shaped, had broken off, and was driven into the bone, the apex of the pyramid piercing it, and splintering it inwards; while the base actually filled up the aperture, and was just on a level with the surrounding bone; and this it was which had come in contact with the probe. The brick being removed and the bone elevated, the boy recovered.

Being dresser to Mr Pollock in May 1870, I was fortunate enough to have under my charge one of the first cases of skin-grafting performed in England. The idea had already been mooted in

Paris and Vienna, but had never been carried out successfully. It must be borne in mind that this so-called *skin-grafting*—a process nearly analogous to the sowing of seed in the earth for the reproduction of a plant—is not to be confounded with *transplantation* of skin, which has been practised from a very early date in the history of surgery. To cover a large raw sore, a flap of healthy skin has often been dissected from the adjacent part, leaving a pedicle of attachment to the surrounding surface; this, slid over or twisted round on to the wound, will stick and grow there, under favourable circumstances, receiving its life through the pedicle until it has formed a perfect attachment to the parts beneath. Noses are built up in the same way with three triangular flaps cut from the forehead and cheeks; and occasionally whole pieces of skin are taken bodily away from one part and transplanted to an unhealthy wound; the new sores caused by their removal being presumed to heal more rapidly than the ulcer. But these measures were not only severe in themselves, but resulted in many failures, and were attended with the disastrous condition, that a want of success left the patient in a doubly worse plight than before the operation. Grafting, however, is a wholly different thing; and perhaps a short account of the case to which I have alluded will convey a better idea of the process and its effects, than a dissertation on the mere physiology of the subject.

The patient, a pretty little girl of eight, was admitted into the Wellington ward of St George's Hospital with the history that, two years previously, her dress had caught fire, burning both legs from the hips to the knees severely. After a year's treatment the left thigh had healed up; but the right had never got better, and presented a terrible ulcer, extending all down the outer side. She was a bright intelligent little thing, and her sad condition excited much sympathetic interest. For four months she lay there without any signs of improvement. Though nourishing food, with wine and strengthening medicines, were freely administered, and all manner of local remedies applied, particularly that most excellent dressing, carded oakum, all was in vain; and when, on the 5th of May, the child was brought into the operating theatre, and placed under the influence of chloroform, it certainly appeared to us to be as unlikely a case to afford a fair criterion of a new treatment as could well be imagined. Two small pieces of skin were then snipped from the back with a pair of sharp-pointed scissors, and imbedded—planted, in fact—in the granulations or 'proud-flesh' of the wound—two tiny atoms, scarcely bigger than a pin's head, and consisting of little more than the cuticle or outer skin which we raise in blisters by rowing or exposure to a hot sun. Five days later, no change was visible; and by-and-by the operation was considered to have failed, since the pieces of skin had disappeared, instead of growing, as had been expected. But twelve days after the operation, two little white cicatrices appeared where the seeds had been sown; and in my notes I find that a week later these were, big enough to be dignified as 'islands of new tissue.' The most wonderful part of it was that, not only did these

islands grow and increase rapidly in circumference, but the fact of their presence seemed to stimulate the ulcer itself, which forthwith took on a healing action around its margin. Several more grafts were implanted subsequently, including morsels from Mr Pollock's arm, from my own, and from the shoulder of a negro; the last producing a white scar-tissue like the rest. In two months the wound was healed, and the little patient was discharged cured.

Skin-grafting is now performed daily in surgical practice, and a special instrument—a combination of knife and scissors—has been invented for the purpose. It is impossible to estimate the immense benefit of this discovery to mankind in many different aspects. Poor people, hitherto incapacitated from labour by 'incurable' ulcers, and for years a burden on their parish, or inmates of workhouses and asylums, will now again resume their place in the great toiling hive, from whose daily work is distilled the prosperity of a nation. Von Gräfe's operation of iridectomy, whereby hundreds of people, who were formerly considered irremediably blind, are now restored to sight by a simple proceeding, is said to have exercised a very appreciable effect on the poor-rates of the country. As an instance of true transplantation, John Hunter's celebrated experiment of causing a human tooth to take root and grow in the comb of a cock, is a well-known instance. Dentists nowadays often remove teeth, and having excised diseased portions, replant them in their sockets with frequent, though not invariable success; and cruel plastic operations have been performed on rats, by which they have been joined like Siamese twins, or their tails caused to grow from their shoulders, or between their eyes. The late Mr Frank Buckland, in his *Curiosities of Natural History*, gives an amusing account of an action-at-law brought by M. Triguel, a French naturalist, against a Zouave who had sold him what was termed a 'trumpet-rat' for one hundred francs; the said trumpet-rat proving to be an ordinary 'varmint,' with the tip of another rat's tail planted in its nose, and growing there.

A watchmaker in Piccadilly was afflicted with suicidal mania of rather an extraordinary description. So far from seeking death as a refuge from trouble, it was only at such times as the world was running along smoothly with him that he was not to be trusted with lethal weapons. Did sickness or domestic affliction cast their shadow over him? did pecuniary embarrassment, or even the ordinary worries and vexations incidental to business, harass him? then there was not a saner man breathing, nor one better qualified to cope with his difficulties, and withstand manfully the slings and arrows of outrageous fortune. But directly the 'bad time' was over, and his horizon was unchecked with a single cloud, an irresistible propensity to destroy himself seemed to seize hold upon him. He had taken poison twice, had thrown himself into a canal, and had made an attempt to shoot himself, but all ineffectually. Several times he had been imprisoned, and once had spent some months in a lunatic asylum; but the very trouble which his act entailed upon himself appeared on each occasion to do away with all desire to repeat it. At length he cut

his throat so badly that for many months his life was despaired of; he recovered eventually, and expressed the greatest abhorrence of his conduct; but a small fistulous opening in the windpipe remained obstinately unclosed in spite of treatment, and became a source of great annoyance to him, rendering it necessary for him always to close it with the finger when he wanted to speak, and giving rise at times to dangerous attacks of inflammation. This went on for three years, during which time he steadily attended to his business, and was in conduct, conversation, and every other respect as rational a watchmaker as might be encountered between John o' Groat's and Land's End. But a successful operation was performed at the end of that time; the aperture healed up; and the man was relieved of a distressing infirmity. Within two weeks, he left his shop one afternoon, and committed suicide, this time in determined earnest.

THE CONTENTED MAN.

THE unassuming cabbage growing up to maturity amidst the alternate showers and sunshine of spring, may be regarded as the prototype of the Contented Man. He would only be too glad if, like Joshua, he could make the sun and moon stand still; for, unmindful alike of the future and the past, he considers the present as his elysium. Change is hateful; it disturbs his placid repose, and casts a misty shadow of futurity into his sluggish mind. Through his roseate glasses he looks out upon the world and pronounces all things good; the thorns and the thistles are hidden from his view, and there remain but the flowers to rejoice his eyes and to gladden his nostrils. The works of sculptors, painters, and authors bear the marks of the individuality of their originators; and we all of us have a not unnatural tendency to liken the lot and dispositions of others to our own. The task must be an especially delightful one to the Contented Man, in the still but muddy waters of whose mind float only the well-fed gold and silver fish of fanciful prosperity. Thus it is evident that he can scarcely be endowed with a highly reflective nature, nor indeed with an unselfish one.

The misery in the world is sufficiently apparent for the blindest to see it, and sufficiently deep and widespread to make the least unsympathetic of mortals sorrowful, and to appeal to their feelings to alleviate it as far as possible. The man who is thoroughly contented must also be thoroughly selfish; and thus it is hardly matter for regret that there should be so little real contentment in the world. This so-called virtue is too frequently but a synonym for sloth, indifference to the feelings of others, and mental feebleness. It is not the stuff of which heroes are composed. No Contented Man has ever yet made, or ever will make, his mark in the world. He stolidly sits on the rung of life's ladder on which the accident of birth has placed him, and gazes above and below him with equal indifference. Why should he stir hand or foot? he asks himself. He has got all that he wants; though, should a chance wind bear any good thing in his way, he accepts it, provided that no trouble be essential to the act of acquisition. The 'toilers and moilers' are

in his opinion but silly fools in pursuit of some Will-o'-the-wisp of fortune, which will vanish, to leave them in the darkest slough of despond. He sees others go past him hand-over-hand up the ladder; but it is without a pang. And when some less fortunate strugglers around him are engulfed in the dark waters of ruin, and pray to him for a helping hand, he moves not an inch. Why should he? Is he not himself, contented?

'Hope springs eternal in the human breast;' but the Contented Man has nothing to do with hope—unless, indeed, it be that his condition may remain unchanged to the end of the chapter. Its bright star does not shine for him, and he is happy without it. He is a phosphorescent individual, emitting sufficient light for himself, though it may be darkness for others. Egotism is his salient characteristic; not an obtrusive egotism, for that would be much too energetic to accord with his disposition, but an egotism which is nevertheless none the less real. On the whole, he may be considered a comparatively harmless individual; and whilst doing no injury to others, he does them but little good. To be hurtful, requires a certain amount of the *potential*; and this the Contented Man does not possess. After the fashion of the chicken in the egg, he is provided with his own pabulum, and cares nothing about the outside world. Gallio is his model; and to drift with the tide, is his motto. But the time may come when the Contented Man finds all is not sunshine and balmy breezes; and when he does suddenly discover an incentive to action, it is to be feared that the capacity for undertaking it may have long disappeared. In the contest for the 'survival of the fittest,' the Contented Man will, like the sleepy old mammoth, become extinct.

RICHES AND FRIENDSHIP.

A CERTAIN man of vast estate,
And generous mind withal,
So freely spent it on his friends,
He soon had none at all.

His fickle friends discovered this,
And then their worth they showed;
They left him, nor e'en paid the debt
Of gratitude they owed.

Ere long the man got rich again—
Much richer than before;
And those who then received so much,
Came now—expecting more!

The man had by this time, howe'er,
A lesson great been taught;
And straight he sent them all away,
With the large sum of—naught!

Friends, he had learned, do round us flock
When we are rich and great;
But when want comes and troubles rise,
They leave us to our fate.

And he had learned what oft is seen
When friends are in request,
That those of whom we think the least,
Turn out to be the best.

LITERATURE, SCIENCE, AND ART.

Fourth Series

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 974.—VOL. XIX.

SATURDAY, AUGUST 26, 1882.

PRICE 1½d.

A TENNESSEE SQUIRE.

THERE is perhaps no part of the United States where life goes on more calmly than in the region of the Cumberland Mountains, Tennessee. This beautiful wilderness is thinly peopled by a race of 'natives'—that is, white settlers and squatters, who are as unaffected by the fierce activities of their fellow-citizens in the Eastern and Western States as if they were inhabitants of another continent or men of another age. Their homesteads are remote from highways; and these highways are so little frequented, that weeks may pass without a stranger appearing. Having very imperfect means of transport for corn or cattle to paying markets, they grow just sufficient for their own use; and simple wants are easily satisfied in a subtropical climate.

Maize is the staple food, wheaten bread being rarely eaten. Swine-flesh of the toughest and least nutritious sort furnishes much of the animal food. Milk is little used. Intoxicating drinks are rarely partaken of, though a good deal of peach-brandy and corn-whisky are said to be made illicitly. But these are sold to saloon-keepers in by-places, and the money expended in powder, shot, and the few articles required for a primitive household.

Tea and coffee are the favourite stimulants of Tennessee natives, particularly the latter. When whisky is not made, game is sold at the nearest town to obtain what is needed; and often the hunter will go ten miles with a pair of deer-hams, half-a-dozen turkeys, rabbits, or other spoils of the chase; and glad is he to bring back a few pounds of green coffee in exchange.

Hunting is indeed the real business of the Cumberland Mountaineer, farming being a mere incident. To roam in the boundless wilderness with a long rifle, accompanied by a dog, is the occupation and the joy of the half-wild men of the Tennessee forests. Wonderful shots are they, rarely failing to bring the deer down by a bullet through the heart. But though loving solitude

more than society, the hunter is kindly, hospitable, and anything but a misanthrope.

In a sparsely peopled country where there are no hotels, the traveller must either carry a tent and provisions, or seek shelter and food from the dwellers in the land. I took the latter course; and never was refused the best that the house afforded. Many hosts repelled all attempts at payment; some even objected to be thanked. The system of demanding and giving hospitality is so common that it is never considered as a benefaction or a favour. What the squatter gives to-day, he himself may have to ask for to-morrow. Business, the chase, a political errand, sends him a day's journey from home, or leaves him belated. That causes him no disquietude. The wanderer goes to the nearest house, assured of a frank and hearty reception. It matters not that he is a stranger. He is received without embarrassment, with genial politeness. But it is necessary to observe that a change is coming over frontiersmen. A host of tramps are prowling over the United States, worse than their fellow-vagabonds in England, and perhaps more difficult to reclaim. The maraudings and brutalities of these men have made farmers suspicious, and chilled something of their native kindliness. Still, the honest stranger is welcomed in a manner that compares favourably with the hospitality of cities; for in these remote wilds, poor people living hard lives, are more neighbourly than the inhabitants of London, Paris, or New York.

One of my pleasantest remembrances of Tennessee travel is connected with a short stay I made at the house of a certain Squire named Harker, who lived on a lonely road some distance from Jamestown. The weather was very hot, and my horse and self were tired with a five hours' rapid ride through forest and fell. It was nearing noon, the Tennessee dinner-hour, as I came in sight of the Squire's log-cabin, to which I had been directed by those who had marked out my itinerary. The barking of a great wolf-hound brought out the Squire. He appeared about sixty

years of age, tall, spare, and lithe as a young man. His hair was steel-gray, face close shaven, skin browned by weather; his eyes light blue, calm and benignant in expression.

'I come to ask for something to eat for my horse and myself,' I said.

'Yes, sir,' he replied, expectorating deliberately. 'Come in.'

With that he led my horse to a trough fed by a mountain stream; and afterwards put the tired animal into the stable, throwing before him some corn-cobs and a bit of coarse hay. Then we went towards the house.

Sitting by the fire was a woman, of dubious age, fifty-five or sixty-five. Although the weather was so hot, she was crouched over the blazing logs. Her face was yellow-olive in colour, thin to emaciation, haggard and wan. Her eyes had a dreamy quietude in them, like those of a person habituated to soothing drugs. Her figure was gaunt as a skeleton, and scantily draped in a faded cotton gown; the outline of her long angular limbs being rendered more observable by an obvious lameness. In her mouth was a long and much used clay-pipe, the bowl black as ebony. She paused an instant in her puffing as I entered, then proceeded to smoke without the least embarrassment.

In the chimney corner near to the mistress of the household stood a beautiful young girl of fifteen, tall as my host, slim as a poplar, with dark pensive eyes, pale olive complexion, and dark hair loosely gathered into a knot. She smiled a childish welcome, which had the effect of destroying the charm of her innocent beauty, for it displayed teeth repellently black. She did not reply to my inquiries respecting her health; for a sudden disquietude passed over her face; her dark dreamy eyes were suffused; she passed hastily to the door. Quick as light she extracted a quid of tobacco from her pretty mouth, and then returned to her mother's side. I tried to appear oblivious of these little incidents, and advanced to shake hands with a young man coming from an inner room. He was shorter and more squarely built than his parents and sister, but the contour of his face and his eyes left me in no doubt that he was the son of my host. A lump of tobacco was in his lower jaw, giving him the aspect of a man suffering from excessive gum-boil. He greeted me with kindly gentleness, and sat down.

The interior of the house was extremely rude. Evidently, from its dilapidation, the cabin had been built many years. The logs were blackened by the weather; the floor was patched and uneven; and through many a cranny the sunlight gleamed. Four beds were visible, two in the general room where I was, and two in a little room half-screened by a curtain. The beds were clean, covered with patchwork quilts, but humbler than the couches of our superior peasantry. A few thoroughly uncomfortable chairs were scattered about; a round table was in the middle of the floor; a rough culinary bench was under the window near the back-door. The fireplace was a stony chasm, without grate, oven, or other cooking apparatus. A large pot, like that used by gipsies, stood upon the hearth. Such was the furniture of this home in the wilderness.

I cannot say that the house was dirty, untidy,

or in any way wretched. It lacked altogether that snugness and comfort that English people associate with home. There was no sign of poverty, of that pathetic confession of a desperate fight with circumstances, so often seen in the neat homes of the poor in England. And the family had no semblance of being 'hard up.'

Mrs Harker was badly, meanly, scantily dressed, worse, indeed, than any labourer's wife in rural Britain. But she did not seem to be aware of it. Miss Harker wanted a new gown, better shoes, a competent hairbrush, and a general reformation in her ideas of attire, though evidently unconscious that she was at variance with correct standards of taste. The worthy Squire wore a pair of pants that had deserved retirement long ago. His shirt was coarse as sailcloth; and though clean, wanted the skill of an abler laundress than his household afforded. His Wellington boots, into which his pants were thrust, were hoary with the mud of years. Blacking is unknown in the Tennessee wilds, and is as superfluous as hair-powder. Shirt, pants, boots, comprised the whole costume of the Squire and his son; as gown, shoes, stockings, seemed to do for the ladies. Let no fastidious dame or scrupulous dandy find fault with such heretical notions of dress. I was myself at that time wearing simply shirt, trousers, and shoes, and feeling that these were a burden grievous to be borne. The temperature was ninety-eight degrees in the shade; in the sun, one hundred and twenty degrees. Teufelsdröckh might have learned something more of clothes-philosophy had he been Squire Harker's guest.

The doors and windows were wide open, permitting a faint current of air to pass through the room; air laden with the perfume of azaleas, growing like rank weeds in the forest, and with the faint odour of the prairie-rose. A humming of bees and buzzing of flies came rhythmically athwart the pauses in the conversation. Outside, the intense white sunlight glittered on every reflecting surface; and the ineffable violet sky soared to an immense height. Across it, here and there, swam rolls of snowy cloud, like pillows of carded wool. The remote firmament, the slow-gliding clouds, the hushing sun-glare, the droning insects, the quiet talk of my entertainers, the stillness of the forest, seemed all harmonious with the calm of a tropical noon.

Hurry here was impossible, rapidity of thought an absurdity, rapidity of action suicide. Life was a wakeful dream, in which to smoke lazily, to exult serenely at the dawdling pace of Time hobbling along on padded sandals, were the only duties.

My hostess informed me that she had long suffered from ague and rheumatism. She had taken all sorts of doctor's stuff, but with little relief. She rose to fetch the bottle containing her medicine, and then I saw how lame she was. Her left hip appeared to have lost its power of articulation. She moved with pain and difficulty, using a strong stick. I was very sorry for her, and we soon became confidential. In talking over remedies, it was clear that the quack was mighty in the land, and that Mrs Harker had suffered much therefrom. And the schoolmaster was feeble. The commonest news of the time was unknown to the family, or had

filtered in by small drops of hearsay. All literary, scientific, or other culture was absent from this household. I was nonplussed at every step, having to begin *de novo* with almost every topic. But I thoroughly interested my friends, who began to look upon me as an extraordinary person, when I tried to explain the genesis of malaria and rheumatism. Diseases were accepted by the Squire's family as mysteries, which no knowledge could fathom, and which medicine could only mitigate.

'I guess you'll like to eat?' said Mrs Harker after a while.—'Get dinner ready, Susan.' This to the daughter.

During the conversation, which was not interrupted, I observed how the meal was prepared; indeed, I could not help it, as it went on under my eyes. After throwing more wood on the fire, Miss Harker half-filled a tin bowl with Indian meal; into it was dredged some 'raising-powder'; water was added, and a paste made in a few minutes. The pot on the hearth was partly filled with hot ashes, and small lumps of dough placed on them; the lid was put on, and the bread-baking was in process. A kettle was placed on the fire, and while the water was heating, the coffee was ground. Afterwards, thick slices of bacon were cut from a rusty fitch, that looked like a section from a pine-slab. A huge heavy frying-pan was filled with the bacon, placed on the fire; and soon the odours of the pan pervaded the room, effectually overwhelming the fragrance of the azaleas and roses. Meantime, from a hidden storeroom, an up-piled dish of apple-jam was brought, and a strange-looking substance resembling cream-cheese. A few cracked cups, plates, and small dishes, very heavy and thick, furnished the table equipage.

The meal was soon prepared; and I took the place assigned me by my host, who immediately sat down on the one side of me, his son taking the other. I waited for the ladies to take their places; but they showed no disposition to do so. Feeling uncomfortable, I ventured to suggest that Mrs Harker should take my seat, which seemed to surprise my friends. No; the women would dine afterwards. The Squire did the honours of the table in a generous fashion, piling my plate with bacon, filling my dish with jam, and pressing the hot cakes upon me. Miss Harker supplied the coffee. Her mother continued to smoke and talk in the chimney corner.

The experience I had subsequently of Tennessee manners and customs showed that the Squire's family was much like others. In no instance did mothers and young children sit down with the father, elder boys, and myself. The old paternal system, which has almost died out in Western Europe, flourishes in the American wilds. No doubt, when strictly *en famille*, the members of the household eat together; but before guests, mothers and youngsters retire into that subjection out of which the race has slowly emerged. But there was no brutal ignoring of the feeble members of the family, no attempt to pass them by. Politeness towards the stranger and the devotion of the host to his guest, seemed to be the reason for this arrangement. I must say, however, that hospitality loses much of its charm when women and children become servitors

and spectators instead of fellow-banqueters. And in the settled parts of America there is such an equality in the family, that I found the squatter's custom more singular than if I had been in another country.

I had made acquaintance with American 'pork' prior to meeting it at my host's table. Its harsh fibre, its rancid fat, its want of all that is gracious in looks and in flavour, and particularly its immense demands upon gastric energy, were well known to me. But it was the *pièce de résistance*, and must be eaten. The cream-cheese turned out to be butter, such as would have made an English dairymaid stagger, and British butter-eaters grateful for oleomargarine or other product of the chemist's workshop. Out of respect for its author Miss Harker, and at the pressing request of her father, I strove to do it justice, but failed totally after one trial. Few people in our islands are condemned to 'corn-bread'; and I sincerely congratulate them. It is altogether wanting in the charm and the sustenance found in our staff of life. Perhaps were it fermented and baked like our wheat bread, it might be more agreeable and nourishing. The cakes prepared by the hands of my young hostess left much to be desired, not for me, but for herself and family, who had to eat them three times a day for life. The apple jam was neither sweet, sour, nor savoury—the completest neutrality in preserved fruits I had ever tasted. Sugar is dear in the United States, and many other plants besides 'cane' are utilised for obtaining saccharine matter. One of these is sorghum, much cultivated in the South; and I suppose my hostess had preserved her apples by this means.

Coffee strong, fragrant, and abundant, was the refreshing and invigorating item in the dinner. Its excellence atoned for a multitude of culinary foibles and failures; and though unsupported by sugar, cream, or milk, it was a tower of strength in itself. Coffee plays an important part in frontier-life, and will advance in estimation as whisky recedes. A generation of farmers, squatters, and pioneers is growing up to whom alcohol is objectionable in any form. A solid rock of opinion is rising against strong drink in every part of America, and I found it nowhere more pronounced than in the Tennessee Highlands. Coffee gives all the stimulant the climate requires.

Dinner being over, the Squire and I went out to see how my horse was faring; then we went to see his tobacco-field, about which we had talked during the meal. Outside the house, everything was as untidy and neglected as within. Under a shed lay a rusty plough, traces, chains, harness, and other gear. A broken wagon was slowly disintegrating in one corner, a mud-splashed rickety buggy in another. An ancient loom was in an empty stall. Corn-cobs, maize-litter, and rubbish from cowhouse and stable, were lying in the yard in every stage of decay. A dismantled snake-fence had once separated this yard from the peach-orchard; but storms and rot had made many gaps, through which gaunt hogs prowled at will. Neglected as the trees were, they were thick with fruit, promising a crop that would have made a little fortune in Covent Garden. But the largest proportion of the peaches was destined

for the Squire's hogs. About fifty magnificent apple-trees were in another orchard, literally bearing as much fruit as leaves. Such trees are impossible in England. The Squire was not enthusiastic in his admiration of peaches and apples, listening to my remarks upon the coming harvest with genial indifference.

Beyond the orchards was a field of maize, so roughly cultivated, that the hogs might have made the furrows, except that there was some attempt at straight and continuous lines. A few days' work had sufficed for ploughing and sowing; a few days' labour would gather the corn; then the Squire's duties as a husbandman would be fully discharged.

Near the maize-field was the tobacco-patch, covered with vigorous plants, upon which the owner glanced with a complacent eye. Beside them was a long strip of cotton-plants revelling in the sun, but sorely hampered with weeds. Cotton was grown to supply the family wants, the women picking, spinning, weaving, dyeing, and making the garments. About half an acre of potatoes completed my host's cultivated land.

It is not considered impertinent to ask a land-owner in America the extent of his possessions; and in reply to my inquiry, the Squire told me he owned about eight hundred acres. Not one hundredth part of this was tilled; but that did not strike Mr Harker as uneconomical.

What surprised me most was the absence of a kitchen-garden. No salads, no cabbages, no beans or peas, none of the herbs cultivated by the peasants of Europe. And not one cultivated flower, save the rosebush by the front-door, and that appeared to be an accident. A ragged, ignored vine scrambled over a corner of the house, the only natural embellishment.

Such was the home of Squire Harker, a justice of the peace, an intelligent man, a sober, industrious American citizen, in whose veins ran the impulsive, domineering Anglo-Saxon blood. Sequestration from society, the infatuations of a hunter's life, want of culture, had made him indifferent to the hopes and ambitions of his age. He had his compensations in such health and vigour as no city dweller can know; he had, too, a peace of mind that passes the understanding of this restless age. He bore his sixty years with greater ease than many an Englishman half the number. He enjoyed the present hour calmly, and looked with absolute undismay at on-coming age, confident in himself and trusting in Providence.

But it was different with his wife and daughter; theirs was the fate of the squaw, mitigated by the tendency of the race. Life for them and others similarly situated, was a narrow and unembellished drudgery, though not of killing hardship. Rude and monotonous diet, which suited hunters, destroyed all the graces and sapped the vitality of the women. Rarely did they quit the precincts of the house; there was no change of scene for them, save the leafing and unleafing of the forest. They had work enough to keep the mind from stagnating, but not varied sufficiently to excite invention, not severe enough to rouse slumbering energies. Fancy had no exercise, and thus speech was ungraced by the common elegancies of language. By the way, it is remarkable how taciturn and slow of utterance the backwoods people are.

Vacancy of mind, deficient exercise of the imagination, and loneliness, tempt many of these women to seek the soothing delights of tobacco. The perfidious anodyne becomes a tyrant necessity, and damages the health, ruins the beauty, and increases the torpor of soul. America is said to be the land of faded matrons. But from my own observation, I believe improper diet, especially the invariable 'hot biscuit,' does more damage to face and figure than the rigours of climate. Bad water, malaria and various febrile diseases do great mischief to form and colour; but rough and ungraceful homes are greater foes to female loveliness. I have seen ladies of middle age, who have lived in superheated rooms amid the excitements of New York's perfervid existence, confirmed toppers of ice-water and devourers of 'candy,' who were nevertheless quite as well preserved as English ladies of the same age.

The fact is, women need the society of their own sex more than men. Body and mind degenerate for want of sympathy, criticism, and emulation. Six months' residence in Cincinnati would have developed Miss Harker into a brilliant young lady, as incapable of chewing a 'quid' as of cannibalism; and the same environment would have cured her mother of the languors and vapours which oppressed her like an atmosphere of carbonic acid. The progress of civilisation in America, in another half-century, will render the fate of women wholly free from the privations endured by Squire Harker's worthy wife and charming daughter.

VALENTINE STRANGE

A STORY OF THE PRIMROSE WAY.

CHAPTER XXXIII.—I HAD THE PLEASURE OF MEETING YOU, SIR, ONE HOT DAY LAST SUMMER, WHEN YOU PAID ME THIS IDENTICAL HALF-SOVEREIGN.

GERARD, grasping Hiram tightly by both arms, faced him beneath the gaslight. Hiram, scarcely understanding as yet who had got hold of him, faced Gerard. The two looked at each other curiously.

'I reckon, mister,' said Hiram, 'that you've made some sort of error.'

Gerard seemed to be of that opinion too, if his face were trustworthy. As to who Hiram might be, he had not at that moment the remotest notion.

'Perhaps I have,' he answered, with a touch of dubious sarcasm in his tone. 'We shall see.' He released Hiram, and warned him. 'Stand there. If you attempt to make a move, I'll throw you out of the window.'

'Then,' responded Hiram, 'I will not attempt to make a move. Your diggings air too lofty.' He kept his eyes on Gerard, but stooped for his hat, warily, and having secured it, brushed it with his elbow, and set it on, a little on one side. Gerard, regarding him, stepped sideways to the letter-box and took out the packet. He knew by the look and feel of it what it was; but he was in a mood to do strict justice. He opened the package, therefore, and found the half-crown in it, and the inscription on the paper, as before.

'Now,' he asked, tossing the half-crown on the table, and looking dangerously at Hiram, 'who set you to do this? Don't prevaricate with me, or I'll break every bone in your body. Tell me who sent you here with these insolent messages.'—Hiram returned no answer, but held him with his glittering eye, watchful of every movement.—'Out with it!' cried Gerard.

'Keep your hair on,' returned Hiram, in a tone of soft expostulation. 'You're in no hurry to get bald.'—Gerard made a swift motion towards him. Hiram made a swifter in retreat. The two being on either side a round table of considerable size, it was not easy to get at close quarters, unless both were so minded. Hiram in his flight contrived to possess himself of a poker, and held it in an attitude of defence; improvised and amateurish, but unpleasant for an assailant to look at. Gerard, even in his heat of anger, recognised the loss of dignity inevitably accruing to a chase around the circular table, and stood still, devising means of approach. Hiram took advantage of this pause, and prepared to offer suasive counsel. 'This is not a reception,' he began, 'calculated to feed the enthosiasm of affection.' At that second, Gerard vaulted the table, closed with him, and wrested the poker from his grasp. Hiram, more fortunate than in their first encounter, eluded his hold, but left a portion of his coat behind. 'Look here!' said Hiram from the other side of the table; 'you ridiculous madman. What do you mean by it?'

'Who sent you here?' cried Gerard again.

'Nobody sent me here.'

'What do you mean by dropping these confounded things in my letter-box three nights running? Who are you?'

'Now,' responded Hiram, in soothing tones, 'this is reasonable. If you'll put that poker down and listen to reason, I'll explain. And if you won't, and will insist on strife, I ain't goin' to let you maul me how you like—mind that. I'm loath to hurt you, and bein' a sensible man myself, I am not hungry to be hurt. You don't know me?'

'I don't know you from Adam.'

'I am not Adam. I had the pleasure of meeting you, sir, ten miles from Brierham, one hot day last summer, when you paid me this identical half-sovereign for carrying a note to Valentine Strange, Esquire.'

'Well?'

'Well. You may remember I told you that you had given me the only streak of luck I had ever had since I landed on these shores. You may recall likewise, that I remarked that if ever you were in a real hole, you might do worse than apply to Hiram Search.'

'Well?' This reiterated inquiry began to assume a dogged and threatening tone.

'I am beginning to see,' continued Hiram, 'that thistles are my proper diet. I own up, straight, that if anybody had offered me help on the sly like this, I should have rode rusty with him. But if you think that my half-crowns are so plentiful that I can afford to play jokes with 'em, you are prob'ly a greater ass than I am. Mister, let me lay it out straight for you. You helped me, when you was that squeezed in with money you could hardly move. Then

I happened to read in the papers about Garling—I won't distress you if I can help it—then you happened to come and dine at my employer's restaurant—I was that mudheaded.—Well, now, between man an' man, you can't ask more. I'm sorry I offended. You can call me anything you like, if it relieves you. I deserve to be kicked, though I should not, as a friend, advise you, or any man to kick me. I apologise with all my heart; and if you fancy that I am mean enough to have offended you willingly, you do me a greater wrong, sir, than I have offered you.'

There was positively a real dignity in Hiram's tone as he concluded. His manner was conciliatory, frank, independent, yet submissive, as became his apology.

But Gerard was an Englishman, and was not going to be conciliated all on a sudden by any man alive. 'Couldn't you guess, you blundering idiot,' he said roughly, 'that you could do nothing more offensive, nothing more insulting?' He was very favourably impressed with Hiram, or he would not have bestowed a word upon him.

The other felt a sort of amity in the rough words and tones, and half unconsciously advanced to meet it. 'Let me make my excuses as clear as I know how,' he said. 'It's partly the smallness of the sum that aggravates the natural feelings of the British aristocrat.'—Gerard laughed outright, his first laugh for six weeks.—'It is indeed,' said Hiram. 'Seriously now, it is. There never was anything I tried to do with my fingers I couldn't manage, worse or better; but in respect to feelings, I haven't got a sense of touch at all, and that's a fact. But now, look here! I am real grieved, but— Look here! Don't you mind me because I can't grease it and make it run smooth, and scent it and make it smell nice. You helped me, and you told me a lie when you did it. Yes, sir. Says you: "I've got no silver, dern it all;" and I saw the shine of silver in your purse. Then says you again: "I suppose you don't earn half a sovereign so easy every day;" and you put that rather harsh, to save my feelings and make me think it wasn't charity. I've thought of that often; and I've said to myself: "Send that man round to me if ever he's in trouble, and I am game to my bottom dollar." I have not your sense of touch, sir, in these matters, but I was deeply grateful, and I've had a liking for you ever since. I took a foolish way of showin' it, and hurt your feelings. But now, I've apologised, and you have looked over my clumsiness, and now—clean straight—I'm worth five pound. Is half of that any use to you?'

'My good fellow,' said Gerard haughtily, 'you are quite mistaken in supposing that I am in want of money. If I were, I should find other means of getting it, than by taking your earnings from you.' He was somewhat touched, in spite of his hauteur. Perhaps he was a little loftier in manner because he *was* touched, and did not care to show it. He read incredulity in Hiram's face; and to put an end to his doubts, he sent his hand into his pocket and drew out a mingled handful of gold and silver. 'I am not in immediate danger of starvation,' he said lightly and in a kindlier tone.—Hiram felt the friendliness of this revelation, instinctively. He did not stop to think it out, but he knew that Gerard

would rather have submitted to any misapprehension, than clear it in this way unless at the bidding of an impulse altogether friendly.—‘You are a good fellow, Search,’ said the gentleman, reaching out his right hand. ‘You misunderstood my position—that was all.’

Hiram pushed out his lean claw at arm’s length and executed a solemn shake-hands.

‘I am glad to see,’ he answered, ‘that I am not such an ass as I thought I was. You laughed just now when I called you an aristocrat. But I was not mistaken.’

Gerard laughed again. ‘This open expression of opinion is a little embarrassing, Mr Search.’

‘I beg your pardon,’ said Hiram gravely; ‘I will not offend again. I have not your sense of touch, sir. I am not an educated man, and I am not acquainted with the ways of society. But I will not offend again.’

‘What have you been doing since I saw you last?’ asked Gerard, anxious to atone for his misunderstanding of Hiram’s gratitude. The man’s downright simplicity and truthfulness attracted him. Hiram began to tell his story. Neither of them noticed that the outer door had all this time been left unfastened, until, in the midst of Hiram’s narrative, a great hammering began upon it, and Gerard arising to open it, met Val Strange and the lawyer in the lobby.

‘Mr Lumby,’ said the old lawyer, directly he set eyes upon him, ‘let me congratulate you! We have recovered everything that villain Garling ran away with. You are a wealthy man once more.’ This was a burst of singular indiscretion for so discreet a man; but the old boy had had the news pent in him for ten minutes; he had been a dear friend and old schoolfellow of Gerard’s grandfather; he had been his father’s adviser this thirty years past or nearly; and he was more puffed out and explosive with joy and triumph than a legal authority of threescore years and ten can endure to be with safety.

The result of the communication thus made was alarming; and Gerard, beneath the little gaslight in the lobby, turned so pale, and made so blind a clutch at the doorpost, that the lawyer caught him on one side, and Val Strange on the other, and led him back into the room, where he sank into a chair, hid his face in his hands, and sobbed hysterically.

‘Really, my dear Gerard,’ said the little old lawyer, standing over him, patting his shoulder, and trying to cover his own error by disregarding the effect it had upon the other, ‘we must have a little jollification on the strength of this discovery. Really we must. Perrier-Jouet must flow for this, sir. Pommery-Greno?—the life-blood of the Widow Clicquot?—what shall it be?’ All this time, he was patting and smoothing away at Gerard’s shoulder.—‘Mr Strange,’ he cried, not ceasing this friendly attention for a minute, ‘we ought to have supplied ourselves upon the way. It is all due to our friend Mr Strange, under Providence, that this amazing discovery was made, Gerard. Your friend Mr Strange is answerable for it.—Come, come, come; you’ll get up and say “Thank you” to Mr Strange, surely. A quarter of a million is worth saying “Thank you” for. Come, come, come.’ Running on thus, to cover Gerard’s confusion and his own, he patted

and soothed until Gerard raised a pale face and looked around him.

‘What hit me,’ he said, ‘was the thought of the poor old governor. If it all came back, it would be too late for him.’

‘No, no, no!’ cried the little lawyer. ‘Let us hope not—let us hope not. Let us trust in Providence. He will recover, and spend many happy years, I trust—many, many happy years.’ And that ancient lawyer, in spite of his face of parchment, and the legal inner dust of fifty years, sat down and wept for joy. In all his threescore years and ten he had known no greater grief than the fall of the great House. A placid equable life of threescore years and ten, with a little love-making in it, so far back that his old love’s grandchildren were common-councilmen, and nothing to mark its even tenor since those far-off days, but two strong friendships. The two dearest friends he had ever had were Gerard’s grandfather and father. Why should he not feel a touch of sacred, friendly joy again? But the old man’s emotion killed Gerard’s; so far as show was concerned at least. The two young men shook hands with each other and with the lawyer; and he, conscious of human frailty, made great efforts, and pulled himself together, and the three sent out for wine, and made bright speeches, and tried to be merry—with the ghosts about them. Constance for Val’s ghost. Gerard’s father with wrecked intellect and blighted life for the old lawyer’s. Both for Gerard, and his pale mother seated between the two. And so the wine ran dull somehow in spite of its sparkle, and suddenly Gerard, in his attempt to be gay, bethought him of Mr Search, and made inquiry for him. Hiram had disappeared.

Hiram indeed was by this time in his own lodgings, pulling at the black clay by the side of a guttering tallow-candle. ‘I am glad of his luck,’ he said heartily; ‘and it’s a sort of weight off of me somehow that Mary’s father has dropped that ill-got load. I’d have liked to have congratulated him; but I daren’t stop for a word. It might pay a waiter too well to look honest, to congratulate a millionaire, when you’ve just lent him seven-and-sixpence.’

When a second bottle had been opened, and one libation poured to Fortune, the lawyer took his leave, and the two young men remained together. Val was very bitter inwardly, and Gerard’s thanks were wormwood to him. Gerard was all gratitude and grief and hope, a very compound of contradictory emotion; Val, all rage, watchfulness, and despair. In his weakness, he was for a moment enraged at his own fealty to honour. Why should he have played such a card as he held into Gerard’s hands, until he was sure of his own end? He was keenly on the watch to draw forth or catch the news of Constance’s whereabouts. He half despaired of winning now, for he had cast the winning card away, and so for once he drank deeply, talking the while with a feverish attempt at gaiety, and pushing the conversation, whenever he could, in the direction of Gerard’s hopes. For a long time, nothing came of this, but at last Gerard said: ‘I shall cross to Paris to-morrow, after seeing the governor.’

‘Ah!’ responded Val, with well-concealed interest. ‘What is going on there?’

'Why,' said simple Gerard, 'you know of course that when this smash came, I was engaged to be married. That went by the board, with everything else. And now it's the only thing I care for, that it sets me right in that respect again. We shall have to divide with my cousins, of course—the poor old governor is out of it for ever, I am afraid—but I shall have enough left. You heard what was said just now. Their share is not more than fifty thousand apiece. That leaves a hundred and thirty-three thousand to the governor, and the old house and my mother's property, besides what is saved from the smash. We are as well off as ever, thanks to you, old fellow. We haven't as much money, of course, but we have more than we shall ever want to spend.'

'And so you're going to Paris to-morrow?' said Val, bringing the conversation round again. It was horrible to listen to Gerard's talk of certainty, but he must listen, to learn what he wanted to know.

'Yes,' said Gerard. 'I shall see my mother in the morning, and break the news to her, and see the governor, and then cross over.'

'Are they all staying there?' asked Val, pouring out a glass of wine, and pressing the neck of the bottle tightly against the glass, to prevent them from clanking in his agitated hands.

'Yes,' responded Gerard. 'Constance has not been well lately, and Miss Jolly—that's her aunt, you know—insisted on going to Paris for a change.'

'Where are they?' asked Val. His voice veiled his own tremor and despair so ill, that he was almost amazed to see it go unnoticed.

'At the Grand Hotel,' Gerard answered; and being no further questioned, slipped into silence.

Val sat on thorns a while, and then took leave. Once in the street, he ran until he found a hansom, and was driven to his chambers at full speed. His luggage was undisturbed. He bade his man carry it out to the hansom, and side by side with his valet, drove to St Katherine's Docks. The boat for Boulogne started that night at eleven-thirty, and was caught at the moment of departure. An eighteen hours' passage would land him at Boulogne at half-past five, in time for the six o'clock slow train for Paris. Even that gave him some faint hope of seeing Constance before she retired for the night. Gerard, starting on the morrow, would leave Charing Cross at half-past seven in the evening, would reach Paris at six in the morning, and would possibly go to bed to snatch a few hours' sleep. There loomed another chance.

Half the gloomy night, Val paced the deck; and at last, with a greatcoat and a rug, lay down upon it, beneath the clouds and the solemn rifts between them sown with earnest stars. There was but half an hour to win by, and the thought kept him awake, in a panic of hope and fear. Slowly the stars faded; the intense depths of sky grew gray; the clouds, which had been gray, grew black; the bleak sunlight touched the sulky Channel billows. He rose again, and paced the deck, and looked at the Kentish coast, still in sight, and sickened for the journey's end. All day long, time crawled, and his veins fevered, and his watch seemed to stand still. But five

o'clock saw Boulogne harbour; and then, whilst the hands of the watch suddenly ran with great rapidity, the boat seemed to crawl on the water. Half-past five, and the harbour scarcely seemed nearer. At six minutes to six they moored beside the Port, but on the wrong side for the railway station. Seven minutes later, Val stood upon the platform, and looked after the last carriage of the retreating train.

He waited with racked patience for the next train. Perhaps after all Gerard might miss it—might somehow be delayed. The slow deliberate seconds, the leaden-footed minutes, the dreary, dreary hours, went by. The mail-train drew up at the platform, and he took his seat. Everything was silent, and the place seemed asleep, until the sudden flare of gas and the sudden rush of storming feet, told the arrival of the mail passengers. He would not look to see if Gerard were there or not. Fortune had been against him all along, and would be against him still. He set up the big collar of his travelling-coat, and pulled his cap down upon his eyes, to escape a possible recognition. The clamour and bustle died away on the platform. The signal sounded. The carriage answered with a jerk to the first motion of the engine, and at that instant a passenger opened the door of the compartment in which Val sat, and leaped in lightly. It was Gerard Lumby.

(To be continued.)

QUEER CASES.

BY A SURGEON.

IN TWO PARTS.—PART II.

WHAT is more troublesome to surgeon or patient than a needle broken off short in the flesh—unless it be two broken needles? Such articles 'travel' terribly. There is so little to lay hold of with the forceps, that any touch which does not effect its extraction is bound to give it an onward impulse. Thus it often happens that a medical practitioner can find no trace of the needle, when his assistance is sought, the patient having already pushed it completely in, in his efforts to withdraw it; and it may become a matter of doubt whether such a thing is really underneath the skin or not. To cut open the flesh on a mere chance of finding it, would be obviously unjustifiable; examination of the part by pressure and squeezing is nearly as bad, from the risk of making matters worse; so an ingenious plan has been devised for ascertaining whether a portion be really impacted or not. A powerful magnet is held upon that part of the body for a quarter of an hour, so as to influence the fragment; then a finely-hung polarised needle is suspended over it, when, if any iron be present, deflection will ensue. In Italy, a kind of ivory probe traversed by two wires has been used for the detection of foreign bodies of this nature in a deep wound, it being connected with an electric battery in such a way that directly the probe comes in contact with anything metallic, the circuit is completed, and its presence announced by the ringing of a bell!

Not many years ago, a remarkable experiment

was tried at the Hôpital dos Lazaros, São Christovão, near Rio de Janeiro. A Brazilian physician pretended to have discovered that 'beriberi,' the mysterious and deadly malady of that country, half-dropsy, half-leprosy, was identical with the true *Elephantiasis Græcorum*, which the ancient exponents of the healing art used to cure by inoculations of snake-venom. An inmate of the hospital, knowing his state to be hopeless as it stood, consented to allow the trial to be made on his body. So a vigorous rattlesnake was accordingly brought to his bedside, and made to bite his swollen and hypertrophied hand, in the presence of a large number of doctors, both native and foreign. It was noted at the time that the reptile displayed great apparent reluctance to use its fangs, and it was not until after much irritation that it could be induced to strike. The punctures were inflicted near the base of the little finger; but the patient was not aware that he had been bitten till the bystanders told him, so lifeless was the part. For some hours, no results were apparent; the characteristic evidences of blood-poisoning nevertheless set in, and before night the man was a corpse.

The case excited a great deal of interest at the time; but the experiment has never been repeated; nor is there any reason why it should be. The reception of the venom into a mass of fibroid and degenerate tissue such as would compose a leprosy limb, would retard and might altogether prevent its absorption into the current of the circulation; while it was pure fancy to attribute the snake's hesitation in biting to anything connected with the disease. Many poisonous reptiles will bear much annoyance, and even ill-treatment, before they can be persuaded to use their fangs; and the case in question really presents no anomalies whatever beyond those to be readily accounted for by the existing circumstances. But what a marvellous thing the venom of a serpent is! In the whole range of pathology, probably nothing presents such an instance of small causes producing great effects. An infinitesimal quantity of a clear, apparently harmless fluid, introduced by a puncture no bigger than the prick of a pin, and with awful rapidity—a few minutes, it may be—a strong man with the thews and sinews of a bull, becomes lifeless clay, already far on its way to decomposition. Perhaps the 'germs'—if such really exist—of deadly fevers and other maladies might be found to be just as insignificant in amount, could they be isolated; but it must be borne in mind that there is a certain period of latency or 'incubation' after their reception into the system, and that neither they nor almost any other known poison take effect with the same fearful celerity as the worst snake-venoms.

The accidents, fortunate and unfortunate, that have occurred within the practice of celebrated surgeons about whose skill there can be no two opinions, would fill a volume. Dupuytren plunged a knife into a man's brain, and relieved him of an abscess in that situation, snatching him from the very jaws of death; yet he killed a patient whose shoulder-joint he had set, by lancing an aneurism in mistake for a simple gathering. And for every such accident which has happened, probably a hundred might be

found, were the truth known, that have been prevented only by what we are accustomed profanely to term 'sheer luck' or 'chance.' I was once clinical pupil of a great London surgeon, one who even then was quoted universally as the greatest authority on the disease of which the case I am going to relate was an instance, and whose public appointments had long testified to the general recognition of his talents. In one ward of the hospital he had a patient who, he told us, was suffering from an abscess in the region of the hip; carefully demonstrating this to us, as he was wont to do, and explaining how such a disorder was to be diagnosed from other things with which a want of due precaution might cause it to be confounded. He then ordered me to get ready his instruments and chloroform by the bedside, as he proposed to incise the swelling when he had finished his round of visits in the hospital, and proceeded on his way; but before he returned, the man suddenly and mysteriously died, without a movement or a groan. There was a *post-mortem* examination of course; and it was then found that what had been mistaken for an abscess was in reality an aneurism, which had burst of itself internally, and caused instant death by loss of blood. An aneurism is a localised dilatation of an artery, which goes on increasing in size quite out of proportion to the blood-vessel itself, so that the sac may be as big as an orange—as it was in this case—or even larger, upon an artery no bigger than a goose-quill. The chief danger in such a tumour lies in the possibility of its bursting at any time, and to lance it would, of course, be almost necessarily immediately fatal. 'Gentlemen,' said our Professor, as the mystery was revealed, and the terrible position from which he had so narrowly escaped became apparent, 'the French have a proverb that there is a special providence for drunkards and children. I say there is a special providence for surgeons!'

Nature is a wonderful surgeon; she commences a conservative process of repair directly after an injury. 'Never too late to mend,' is her motto. An old man, of the enormous age of one hundred and two, came under my notice with a broken hip—that commonest of fractures among elderly people, whose bones are dry and brittle, often caused by accidents so slight as tripping the foot in a loose fold of carpet. No active treatment could be adopted; mechanical appliances would have caused mortification of the skin in a subject enfeebled by senile decay; so he was placed on a water-bed and kept wholly at rest. He lay there for twelve months, suffering but little pain, and then peacefully passed away, having ended his long life in comparative comfort. After death, it was found that the fracture had actually healed, though naturally in a false position.

A disagreeable little *contre-temps* happens sometimes to young practitioners who are called upon for the first time to set a dislocated jaw. It rarely happens twice to the same operator. When the jaw is 'put out,' the hands, to effect its reduction, must grasp it over the teeth as far back as possible, so as to exert force in the necessary direction on the angle. It is often no easy matter; but when it *does* slip in, it goes back so suddenly that the mouth shuts to with a snap like a rat-trap; and the young surgeon

draws an inference that for the future it will be better to shield his fingers with cork or india-rubber in dealing with cases of this kind.

It is a well-known fact that people whose limbs have been amputated tell you that they can feel their fingers and toes for a long time afterwards—for years, sometimes—and will even describe pain and definite sensations as affecting certain joints of individual digits. This is readily understood when we remember that the brain is the only part of the body that *feels*, all sensations and impulses being conveyed to it from different parts by nerve-fibres. Feelings of pain, heat, cold, touch, and the functions of the special senses are telegraphed to it; and when the connecting nerve is divided, it may be some time before it learns to localise truly the seat of the sensation it appreciates. When we knock our 'funny-bones,' we experience a thrill in the little finger and inner border of the hand; the fact being that we have stimulated the bundle of telegraph wires—known as the ulnar nerve—which transmit sensations from that finger and part of the next, in the middle of its course, as it winds round the joint of the elbow.

Some years ago, a nurse in one of our Metropolitan hospitals, mistaking one bottle for another in the dim dawn of a foggy morning, gave a poor woman a teacupful of concentrated carbolic acid, instead of black draught. The unfortunate patient drank half of it, and might have taken it all before discovering the mistake, had she not paused for breath. She died in great agony in a few minutes. Medical men were of course on the spot; but nothing could be done. There is no antidote to carbolic acid; and the mouth, throat, and—as we afterwards found—the stomach were so burnt that it was impossible to use the stomach-pump; they were in fact charred white, like a stick. It appears extraordinary that any one should drink such a quantity of a fluid so intensely corrosive as this acid without finding the mistake directly it touched the lips; but medicines, never agreeable, are usually swallowed as hastily as possible, and the patient does not stop to analyse any specially unpleasant sensations, when he knows that some such are inevitable.

A curious parallel to this case was brought before me at sea, where a quartermaster went into the cabin of an officer on watch in the middle of the night, and seizing what he took to be a bottle of brandy, drank about six ounces of the contents. It was pure carbolic acid, and the man fell dead before he could summon assistance; but here, too, we may account for the large amount swallowed before the character of the liquid was recognised. He was consciously in the commission of a theft, and being, moreover, in danger of detection every moment, no doubt hurried to secure the brandy as rapidly as he could, the expected fluid being also of a burning nature to the palate and throat. In this last case, the carbolic acid, though not in its own characteristic bottle, was labelled 'Poison,' and was kept in the officer's washing-locker. The quartermaster had no doubt caught sight of the bottle there, and imagined it was stowed away for concealment. About a tablespoonful of this excellent disinfectant in the morning's bath is a great luxury in the tropics, not only allaying the

maddening irritation of existent 'prickly-heat' and insect bites, but acting as a preventive to other eruptions, and offering a discouragement to mosquitoes and other pests of these regions.

PLAYING THE WRONG CARD.

IN FOUR CHAPTERS.—CONCLUSION.

MR STYLES sat silent and stupefied, after the departure of his colleague. The pipe had gone out, and was not rekindled; while the jug of beer, which had given point to the sarcasm of Charley—as he still called him in his reverie—remained untouched at his elbow. The situation was indeed a serious one for the 'unlucky Professor.' He had been buoyed up by the prospect of this unexpected windfall; he had seen his way to taking larger halls, and 'working' larger towns for the next week or two at anyrate, by its help; and now it had utterly vanished, plunging him, as a matter of course, as deep into despair as its prospect had raised him into hope. He had sent the baggage-man and the properties on to Bingle-don, where he was announced to open the next night; a deposit was paid on the large room at the Town Hall; bills by this time were circulated, his posters had been out for some days. And now all this trouble was lost; his outlay was forfeited. He could not open by himself. Even if a musician could be found in Bingle-don, a thing hardly likely in so sedate and prim a town—such a musician as would suit *him*—what was he to do without Lucile? Her loss was utterly fatal to the speculation; in fact, her loss would be fatal to his business altogether. His slender resources would not, could not, hold out until he had replaced her. His properties would be seized, and he should be ruined. 'My health's a-going,' he muttered, as he reached this stage of his reverie; 'and I shall have to go to the workhouse. I little thought when I took old Ben Boley half-a-crown and a pound of tea last year, that I should so soon come to be where I saw him; but it's what I am coming to.'

A tremendous knock at the street door interrupted and startled him. He listened with a foreboding of some fresh evil; but ere he could determine who was the visitor, the door of his room was thrown open, and Mr Ignatius Hythe came hurriedly and excitedly in. 'Here's a pretty go!' exclaimed that gentleman, who could scarcely gasp out the words—'here's a pretty go! Where's that confounded foreign scoundrel? He has done it! A nice thing I have made of it by employing him.'

'What has he done? I should really be glad if you would tell me,' returned Styles; 'for he has been here talking in a crazy style about being revenged, and says he is actually the person we employed him to represent.'

'So he is!' cried Hythe. 'The vagabond was just the last man in the world we ought to have spoken to. He has nearly killed my brother, and has entirely ruined me.'

'What *has* he done?' exclaimed Styles, who was partly excited and partly frightened, as his visitor plunged frantically about the room. 'How

has he killed your brother? How has he ruined you?

'He has given my brother a shock from which he will never recover,' said Mr Ignatius; 'he has had a fit in consequence, and in his weak state it will be fatal. But he has actually seen his daughter! This abominable foreign musician, or whatever you choose to call him, is her uncle. He showed her to Maurice. He took her away with a threat that Maurice should never see her again. What is the consequence? My brother now knows that she is alive, while previously he only dreamed it. His conscience, which was morbid and troublesome enough before, is now irresistible. He means to telegraph for his solicitor to-morrow. He will alter his will in favour of this child, so that now we shall get nothing at all! If she had remained here, it would not have mattered, as he would have been content with providing for her, and compensating by kindness for any wrong he had done; but he regards what has now happened as a judgment, and that on account of it he is bound to mortify himself and all his friends.—And by Jove, sir, it is mortifying!' concluded Mr Hythe, with an abrupt change of tone.

'Well, what are you going to do? What do you want me to do?' asked Styles. 'He has entirely broken up my tour. I have billed my two next towns, paid a deposit on the hall at Bingleton; and here am I without a chance of giving the show, and hardly enough money left for my railway fare.'

'Oh! here's some money; take it; I want your help,' exclaimed Hythe, throwing a number of sovereigns on the table.

With sparkling eyes, the Professor scrambled them up. 'Well, what help do you want from me?' he asked.

'We must find this fellow; we must get back the girl!' returned Mr Hythe. 'Confound him! He has no right to keep her from her parent. It's unnatural—it's atrocious. If I can get hold of her, I have not the least doubt, from what I know of my brother, that we can manage him very well. So we will follow this foreign scoundrel, and catch him if we can. I will claim the girl, and call in the police if necessary. Gad, if it's necessary, I will seize her by force, and you must back me up!'

'Oh!' ejaculated Styles, with a perceptible lengthening of his visage; 'I don't altogether like that idea. He's a dangerous fellow, and he carries the ugliest knife you ever saw out of a butcher's shop.'

'I don't care for his knives or any of his foreign tricks!' exclaimed the desperate Ignatius. 'I'll knock him down with my stick, if we really come to a fight. But for the matter of that, I would just as soon be run through the body as not, if we don't get the girl back.'

'Ah! but I wouldn't,' said the cautious Styles; 'and I give you fair warning that while I will do all I can in the way of persuasion, or will back you up in case we fetch the police, if it comes to fighting—keep me out!'

'I'll do that part of the business,' said his resolute visitor. 'Rather than not keep my brother from altering his will, I would face twenty foreigners with twenty knives apiece.

—Now, come on. How shall we get on his trail?'

'That won't be very difficult to begin with, at anyrate,' said Styles. 'He must have gone by rail, if he has gone at all; and a little gossiping place like this has one advantage—everybody knows everybody; and I'll defy such conspicuous characters as Charley and Lucile to take tickets without their being known and their destination remembered. We are right for the first stage, I am certain.'

'Then on with your coat, and off we go,' continued Hythe. 'If there's a train any time to-night in the direction they have taken, we follow.'

'But about Bingleton?'—began Styles.

'Let Bingleton shift for itself! The people at Bingleton can do without you, I daresay. Telegraph in the morning, or do what you like; but let us lose no time now.'

Thus urged, Mr Styles had no option but to comply. The sovereigns that had been so lavishly thrust upon him softened in a wonderful way his feelings regarding the disappointment of the good people of Bingleton.

In a few minutes they had left the house, and were at the railway station, where the correctness of Mr Styles's judgment was at once made manifest. The clerk and porter each recollected the departure of Mr Joinville, as they called him, accompanied by Mademoiselle Tuscano, and recollected also that they had taken tickets for a station named Bushfield. The night-mail, due in about an hour and a half, stopped at that station.

'He will change there, and go across to Stumpley, which is on the South-western line,' said Hythe. 'He means to go on to Southampton, and take a steamer for America; that's his game.'

'But I don't think he has enough money'—said Styles.

'Oh! there's never any telling with these foreigners,' interrupted Hythe. 'He may have been screwing and saving up ever since he has been with you.'

Mr Styles made no reply to this suggestion; but by an expressive frown and shake of the head, he might have been of opinion that 'Charley,' as he still called him, was not likely to have saved much while in his company.

To follow their journeyings in quest of the fugitives would only weary the reader. Suffice it, therefore, to note that Mr Hythe and Styles at length found themselves—*en route* for Southampton—at Bushfield Junction.

The junction was at a very lonely spot; a straggling village was the nearest approach to a town for several miles; while out on the bare downs beyond, or in the narrow dull lanes which served for byroads, there were but few cottages to be seen, and still fewer buildings which deserved the name of farmhouses. So there was little to invite any one to go strolling about in the quiet light of the sinking sun, which was now just visible above the low hills which bounded the view to the west. Thus argued Styles; but Hythe was of a different opinion. Luckily, however, he did not deem it necessary to insist on the Professor accompanying him in his ramble; and so, comfortably ensconced in the village inn, with the London paper to

read, his legs resting on the long seat, the oft deferred meal at last served, Styles awaited his companion's return without impatience.

Mr Hythe, restless as before, soon got beyond the limits of the village, and crossed the wide common which lies immediately beyond. He then turned to retrace his steps, as twilight had set in; and the occasional barking of dogs reminded him that it might be unpleasant to find his way back after dark. Passing one of the few houses which were of somewhat better grade than the poorest labourers' cottages, he saw a woman standing at the door, who looked so earnestly at him, that he thought she was about to speak. Slackening his pace, he looked fixedly at her in turn. The woman noticing it, said apologetically, and dropping a rustic courtesy, as she spoke: 'I thought, sir, you might be Dr Camm, or some one from him; that's what I was looking out for, sir.'

'I am sorry you are disappointed,' replied Hythe. 'I hope you have no serious cause for wishing to see a doctor.'

'Indeed, I have, sir,' said the woman; 'and I am afraid Davy—that's my boy, sir—hasn't found Dr Camm at home, he has been so long gone.'

'I have been a doctor, although now retired from the profession,' said Hythe. 'If I can be of any service till your own doctor comes'—

'You are very kind, sir,' replied the woman, as Hythe paused; 'and if you would not mind looking in, I should be a great deal easier in my mind. We have had a gentleman and little girl staying here for a day or two.'

'Eh? a gentleman and little girl!' repeated Hythe, roused into the keenest attention at once.

'Yes, sir,' she continued. 'They are foreigners, I think; and he is mortal bad to-day. I think he is going out of his mind, as well as being dreadful ill, sir; and the little girl is so frightened.'

'Where is he?' exclaimed Hythe, in a decided tone. 'I will see him at once.'

'I don't know, sir,' said the woman hesitatingly, 'whether he has got any money; and we are too poor'—

'Oh! that is of no consequence,' returned Hythe, with a readiness which at once impressed the poor woman with a sense of his generosity. 'Just show me to his room.'

The woman turned, and led the stranger into the front-room, which, meanly furnished as it was, was evidently the best parlour of the house. A low moaning sound was audible as he entered. 'That is the poor gentleman, sir,' she continued. 'He is in the back-room. I will go and see if he is sensible.—This gentleman is a doctor, my dear, and will cure your uncle.' This last phrase was addressed to a girl who sat cowering and shy in the darkest corner of the apartment.

Hythe had not seen her until he followed the direction of the woman's eyes. 'Ah! it's all right! I have her now,' was his mental ejaculation. The girl looked up at him without any recognition in her eyes.—'This is a strange place for you, my dear,' said Hythe. 'I know from the landlady that you have not been here long. Were you about to settle in this village?'

'No; I think not, sir,' replied the girl. 'I hardly know what Mr Charles was going to do; I think he meant to go back to America.'

'I was not far out in my guess, then,' thought Hythe.

The return of the woman stopped further conversation; and he accompanied her to the bedroom, where, restlessly turning on his couch, lay the man whom he had sought.

As would have been the case with every other doctor, personal feelings, likings and dislikings, all ideas of danger to himself from this man, were instantly banished, and Hythe saw in him only a suffering patient. 'His brain is dreadfully affected, and he is in great danger,' said he to the landlady presently. 'I think it is more than probable that he will die here.'

'O dear me! deary me!' exclaimed the poor soul, wringing her hands. 'Whatever shall we do? My husband has been out of work these four weeks with a bad hand.'

'I will wait until I see your local doctor,' continued Hythe; 'and will ask him to send a nurse down to assist you. As it strangely happens that I know this man, I will be responsible for all expenses, and will take the girl to her friends. There is a person waiting for me at the *Half Moon Inn* at Bushfield, to whom the little girl is well known. Can you send for him?'

'O yes, sir!' exclaimed the woman, whose face had brightened considerably. 'I do think I hear our Davy outside now. He will go.'

She was correct. Davy came in with the news that he had been waiting until Dr Camm returned; that he had seen that gentleman, who had promised to follow him in a quarter of an hour. Stimulated by the promise of a shilling, Davy lost no time in hurrying back to Bushfield as fast as his heavy, clay-clogged boots would carry him, bearing Mr Hythe's card, with a request for the immediate attendance of Styles.

The doctor arrived first, and promptly coincided with the opinion already expressed by Hythe as to the fatal nature of the illness. He readily agreed to find a nurse, and took charge of a few pounds which Hythe left in his hands for current expenses. As he did so, a little bustle was heard in the parlour, followed by an exclamation of delight and surprise from the girl. With a word of apology for his abruptness, Hythe hurried to the room, where he saw, as he expected, the girl clinging round Styles's neck in a transport of delight.

'Have you come to take me back?' said the child. 'I do not love Mr Charles as I love you.' (She had been taught to speak of him always as 'Mr Charles' in the company.) 'He does not love me at all. Do not send me away again!'

'No, Lucile, never; you shall never leave me again,' said Styles; 'that is,' he added, as he recollected the claims of Mr Maurice Hythe, 'you shall never go anywhere but where you please, and where you are happy.—She always took to me, you know,' he continued in a low tone to Mr Hythe. 'We have been together these two years, and I always considered her as my daughter.'

The girl would not part from Styles; and so, holding his hand, she presently set out to walk to the junction, Hythe following closely, after a final consultation with the surgeon, who

promised to let him know, by telegraph, the patient's state in the morning—if he lasted till then; but unless some unlooked-for change took place, he probably would not hold out.

Catching an early train, the three reached Fieldenham by midnight, where, under pretence of not disturbing their landlady, and after repeated promises from Styles to call for her the next day, the girl consented to go to Myrtle Villa to sleep, and there met with a warm reception, Mrs Hythe being quite as much alive to the importance of her restoration as was her husband.

In the morning, Styles came round punctually; and as he came to the gate, there arrived also a telegraph messenger, whose tidings were brief, but final—Villada was dead. There was an unavoidable shock in hearing this; but both Hythe and Styles were secretly conscious of a feeling of relief. Lucile—we shall for the brief remainder of our story preserve her old name—who had had no idea of his danger, was not told of his death for some days.

Early in the forenoon, as may be supposed, Mr Hythe took the girl round to his brother, who was now so weak that he could not stand, and was lying on a couch which faced the window; but the interview which followed shall be outlined in the description given of it by Mr Ignatius to his wife.

'It was like a resurrection, Maria! If you had seen a ghost, you would not have been more frightened than at seeing that panting, hollow-eyed fellow rise up with a sort of scream.—But she wasn't frightened; not a bit. How she knew he did not mean her any harm, I can't say, but she took to him directly. He says he shall get well now; and I believe he will.—I had a long talk with him, and it will be all right, Maria.'

It was all right, from the Myrtle Villa point of view. Delighted at the restoration of his daughter; thankful for the opportunity of undoing his wrong in part, at least, Maurice Hythe became a new man; and never forgetful that it was to his brother's energy and wonderful sagacity he owed these boons, his lawyer was again summoned, and the will was this time altered in a manner which gave general satisfaction.

A very handsome present to the poor woman at Bushfield Common raised her to the seventh heaven of delight, as it did also her husband who had the bad hand, and 'Davy' the messenger; while Mr Styles— But he also shall speak for himself. He often did speak of himself as he sat over his glass of grog in the select parlour of the *Three Blind Mice* at Kentish Town, N.W., which hostel stands at the corner of the street in which were situated Mr Styles's apartments. 'And that's how it was, sir,' he would say, when finishing his oft-repeated narrative. 'The tour which I thought was going to be a complete bust-up for me, was the making of me. The loss of my dancer and my pianist, which made me think of the workhouse, was the only thing, as it turned out, which could have kept me from it. I never went a tour again, and never shall now, and I don't want to. She don't forget the old man, sir; and if I ain't rich, I ain't poor, and I can jog on quiet and comfortable, as long as I've got the breath

to do it. This is the only time, sir, I ever knew a game won by playing the wrong card, which was what we certainly did when we put Charley on the business.'

BOOK GOSSIP.

THE study of history seems to be increasing both in attractiveness and popularity. This may be due as much to the brilliant literary talent which has been brought to its service, as to its own inherent interest and value as a subject of study and means of culture. There were great names associated with the literature of history in the last century—Gibbon and Lord Hailes, Hume and Robertson; but of these, the first two have alone maintained their places as historical authorities; Hume and Robertson being now read more perhaps for their manner than their matter—for their lucid and original style, rather than for the accuracy of their historical presentations. If we have not many greater writers in the present century, we have at least better historians. Moreover, the methods of historical investigation have improved so much within the last fifty years, that history may almost be said to be an invention of the nineteenth century. To more accurate and scientific methods, also, have been added many attractions in regard to the style and treatment of historical narrative. It is not now confined simply to the relation of state intrigues and great military conflicts; it is recognised more and more as a means by which the life of a *people*, rather than the history of a kingdom, is to be traced to its sources. The story of the political struggles and social throes which gave birth to the most precious of our constitutional and civil rights, is of more interest, because fraught with more instruction, than the record of armed conquest and battles and bloodshed. The simple narrative of the Ship-money episode in the reign of Charles the First, is more illustrative of a people's progress, and hence of greater value to the historical student, than the history of all the battles that were fought and won in the campaigns of Marlborough.

Nor is it alone to the more mature minds and the more advanced readers that modern historians appeal. We have short histories by men like Green and Freeman, in which all that is essential to an intelligent appreciation of the historical problems presented, is laid before readers in language which the youngest need not fail to understand. Other writers have followed the example of these greater names; and among works of this kind we have pleasure in noticing the volume entitled *Charlemagne*, by the Rev. Edward L. Cutts, B.A. (London: Society for Promoting Christian Knowledge). This is really a history of the Franks from their first inroad into the Roman Empire in the reign of Gordian, down to the death of the great Teutonic emperor whose name gives title to the book—a period of about four hundred and fifty years. The life of Charlemagne embraces the period between 742 and 814 A.D.; but some knowledge of the early settlement and inroads of the Frankish barbarians is necessary to an intelligent understanding of the reign which forms the central subject of the book. This the author gives with commendable brevity,

and at the same time with clearness and spirit. The style is familiar without being flippant; and the author draws for his materials upon the more picturesque among ancient and modern authorities. The story of Charles the Great, as thus told, will not fail to be useful to many who have not the leisure or means for studying more elaborate works. A knowledge of what this great Emperor did, and what he aimed to do, is essential to a clear understanding of European history in mediæval and modern times, and may be said to lie at the very root of it. This volume by Mr Cutts will render the subject accessible to any who have the desire to acquaint themselves, briefly, clearly, and comprehensively, with the leading characteristics of the person and history of this great mediæval monarch.

A vivid idea of some of the treasures of the Boolak collection of Egyptian antiquities at Cairo, may be gleaned from a book recently published from the pen of Mr Villiers Stuart of Dromana, M.P. *The Funeral Tent of an Egyptian Queen* (London: John Murray) is the title of this work; the greater portion of the book consisting of a description of the remarkable tent or canopy which—as we have noted in our article on Recent Egyptian Discoveries—belonged to one of the royal mummies recently brought to light at Deir-al-Bahari. A representation of this wonderful work of art, composed of hundreds of pieces of leather carefully dovetailed together, is printed in colours; and we learn that the tints of the original work, here reproduced, are almost as fresh as they were when first the pigments were coaxed into such quaint characters nearly three thousand years ago. There are many other features of this book which will cause it to be valued as an addition to our knowledge of the treasures of ancient Egypt.

The beetle, as is well known, figures prominently on all Egyptian monuments, and is represented in the above canopy as flying with a ball upon his head. Mr Villiers Stuart gives a plate representing in various attitudes a beetle of this description which was caught by himself, and he accompanies it with an interesting description. The male is furnished with horns, these horns enabling him to perform a duty which is peculiarly his, namely, to carry balls of wet Nile-mud balanced on his head, for his mate at home to deposit her eggs in. The female is without these horns, and therefore cannot carry the pellet necessary for the security of the egg. The Egyptians, says Mr Stuart, having seen the beetles industriously rolling the globe of clay, like their emblem of the sun, and seeing them also during flight decorated with the horned disc, their emblem of divinity, came to the conclusion that they were worshipping the sun, and held them in corresponding veneration. Again, the egg deposited in the mud-pellet, after passing through the usual transformations, broke forth into life as a perfected scarabæus, and gave the Egyptians the emblem of life out of death. Hence its frequent appearance on the tombs and funeral vestments of ancient Egypt.

In the City of London—that is, the City proper, as distinguished from the Metropolis in general—there is a large population which appear within

its bounds during the day, but disappear at night. They have offices in the City, but they do not sleep in the City. Consequently, when the census of London was taken in April last year, it was felt that, as being a *night* census, it failed to represent the true condition of that portion of London known as the City, and steps were adopted to have the defect rectified by the taking of a *day* census. The sum of twelve hundred pounds was voted for this purpose by the City Corporation, and the census was taken between the 25th and 31st of May following the Imperial census. The results of this special counting of the people have been published under the title of a *Report on the City Day-Census, 1881* (London: Longmans, Green, & Co.). Under the Imperial census, the number of people found to be in the City of London during the *night* was 50,526; but this number under the *day* census is found to be 261,061. That is, there are more than five times as many people within the City of London during the day as there are sleeping therein during the night. And not only may the City be said to be thus depopulated during the night, but this tendency of things is constantly on the increase. In 1871, the night census showed a population of nearly 75,000, as against the 50,000 of 1881, being a decrease of fifty per cent. within the ten years. No wonder, therefore, that the old City churches, notwithstanding their many sacred and historic associations, are nearly empty on Sundays; seeing that the suburbs and surrounding towns connected with the Metropolis by rail and omnibus, draw more than two hundred thousand persons out of the City every working day at the close of business hours. The book affords many points of curious study to those who are fond of statistical information.

To the number of popular books on science, in which the scientific spirit is not sacrificed to the mere demand for an hour's amusement or relaxation, we must add *Talks About Science*, by the late Professor Thomas Dunman (London: Griffith and Farran). Mr Dunman was one of the men who had to toil upwards more by his own energy and application than by the assistance of others; and like many more who have thus had the bloom of life rubbed off in the friction of their early years, his health was undermined, and he died young, leaving the world just at the moment when he was best equipped to serve it. This little volume has been prepared rather as a slight memento of his method of teaching, by which he was endeared to a wide circle of students, than as containing any original contributions to the general knowledge of the subjects of which it treats. These subjects are such as the mechanism of sensation, prehistoric man, volcanoes and coral reefs, ice and the ice-age, how the earth is weighed and measured, with papers on the stars, on atoms and molecules, and on the lobster and common frog. His lectures, of which the papers here printed are examples, were, says his biographer, enlivened by allusions to poetry and romance, and full of living interest; while here and there were flashes of quiet humour which won his audiences, and afforded abundant explanation of his popularity with his students. This applies to the papers in the book before us, which are

at once clear and precise as regards the information that is to be conveyed, and interesting and attractive in respect of the style in which that conveyance is effected. We have no doubt the book will prove eminently useful in arousing in the mind of readers a renewed interest in questions of popular science.

THE MONTH.

SCIENCE AND ARTS.

A FEW artists, bearing well-known names, wrote a joint-letter to the *Times*, praying that, if possible, precautions may be taken to save picturesque Cairo from the fate of Alexandria. A somewhat similar cry was heard from archaeologists, owing to the rumour that the well-known Boolak Museum—which in their eyes is the most valuable, if not the most picturesque adornment of Cairo—was to be sold to replenish the coffers of Arabi Pacha. This Museum owes its existence to the French antiquary Mariette Bey; and, as our readers are aware, it contains the principal part of those treasures and curiosities which the Egyptian tombs have from time to time revealed. In one way, the dispersion of these memorials of ancient Egypt—provided they found their way to the safe custody of European Museums—need not be regretted, for the building which at present holds them is said, from the undermining of the Nile, to be in a rather dilapidated state. But the mere suggestion that such a man as Arabi has cast a wistful glance upon them, raises fears that some of his fanatical followers may from utter wantonness destroy relics of their country's past which can never be replaced. It is to be hoped, however, that such a catastrophe may be averted.

Although civilised nations have left the records of their former greatness in their tombs and other monuments, those whose lives were spent in a savage state, and who had no such heritage to leave behind them, have not passed away into silence without leaving very distinct traces of their whereabouts. The 'kitchen-middens,' or vast heaps of shells which are now found on so many coasts, together with the bone and flint implements buried in them, tell us of the food and mode of life of these very early dwellers on the earth. Many attempts have been made to calculate the time which must have elapsed before these heaps of refuse could have attained the dimensions which they now exhibit; though a writer in a recent number of the *American Naturalist* endeavours to show in a very interesting manner that these calculations are likely to exaggerate the time necessary for such accumulation. His observations are directed to the Inuit tribes on the Alaska coast, who, in common with other savage people in various parts of the world, are at the present day contributing to its surface these remains of their daily meals. He tells us how he has watched a healthy Inuit family despatching their meals of echinus or sea-urchin—how their teeth crack the spiny shell, and how the luscious contents are licked out before the debris falls in a continuous shower to the ground. He says: 'The heaps of refuse created under such circumstances during a single season were truly astonishing in size. They

will surely mislead the ingenious calculator of the antiquity of shell-heaps a thousand years hence.'

The recent bombardment of Alexandria naturally gives a zest for naval and military information, and the following note, communicated to a contemporary by the Superintendent of the Royal Laboratory at Woolwich, giving as it does the particulars of the cost of each charge fired from one of the *Inflexible's* eighty-one ton guns, will be of interest:

Cartridge filled, 425 lb. P ₂ powder.....	£10	2	0
Bag, bursting, filled.....	0	12	6
Shell, Palliser, 16-inch.....	11	16	5
Gas-check for do.....	2	17	9
Tube, electric.....	0	0	4

Total cost of one round.....£25 9 0

That is, in round figures, £100 for every four shots fired from the *Inflexible*.

It is reported that the Council of the Royal Geographical Society contemplate the equipment of another expedition to the 'Dark Continent,' in order to explore the mountains Kenia and Kilimanjaro, and the country which separates them from the eastern shores of Victoria Nyanza. This expedition is to be under the command of Mr Joseph Thomson, and will start on its mission early next year.

The Royal Agricultural Society have been very unfortunate of late years, owing to the persistent rain which has driven sightseers from their annual shows. The present rainy year has proved no exception to the rule; but as a set-off, the wet weather has called attention to two new modes of hay-making which would perhaps have been forgotten, or lost sight of, if the sun had been more generous with its beams. One plan which has already been in vogue for some years is that of Mr Gibbs, who by passing wet grass through a hot-air machine, is able at once to convert it into valuable hay. At the late Agricultural Show at Reading, six acres of grass, estimated to yield twelve tons of finished hay, were converted into dry hay in six hours; whilst, had it been allowed to lie on the ground, and left to the tender mercies of such weather as we have since had, it must have rotted and spoiled. The other process of saving wet grass is that of Mr J. Coultas. Mr Coultas does not use hot air, but directs all his attention to the construction of the haystack and to means for keeping it cool. His method of procedure is briefly as follows: In building the stack, an aperture, or rather inner chamber, is formed, by placing in the midst of the material a stuffed sack, which is withdrawn before the stack is complete. From the lower part of this chamber there is carried an air-shaft or pipe to an exhaust fan outside the sack. Apertures are also made in the stack for the insertion of thermometers. When the heat from the wet mass rises above a certain limit, the fan is set in motion; and while it extracts the saturated air from the stack, the outer atmosphere is dragged into it from every pore. In this way the temperature is rapidly reduced and the grass quickly dried into sweet hay.

The unseasonable weather has perhaps had something to do with the invention of a very clever little contrivance for recording the duration of rainfall. Most of our readers must be familiar with the form of the ordinary rain-gauge or

pluviometer, which may be roughly described as a funnel leading to a graduated glass vessel, by which the amount of liquid collected can be easily read off in hundredths of an inch. This rough-and-ready apparatus, although it has been improved upon so as to prevent loss by evaporation, &c., leaves much to be desired. It would take no note, for instance, of very light showers, which would therefore pass unrecorded. The new rainfall recorder, the invention of M. Schmeltz, appears to meet this want, for it will register the falling of a single drop, provided that drop falls upon its sensitive surface. It consists of a box containing a slip of chemically prepared paper, which moves by clockwork from one reel to another, a certain length of the paper passing, as in the Morse and other printing telegraphic machines, within a given time. The paper in question is first treated with a solution of sulphate of iron, and after being thoroughly dried, is brushed with tannic acid. A drop of water on such a surface is sufficient to bring the two chemicals into nearer relationship, and a dark mark is the result. (Our chemical readers will see that the two agents named are the constituents of common writing-ink.) It stands to reason that if the paper be graduated into hours and minutes, the exact time and duration of the rainfall will be recorded. It will be noticed that this rainfall recorder does not afford any means of judging of the amount of water received by the soil, and perhaps for this reason it will serve as an aid to the ordinary rain-gauge, rather than a contrivance destined to supersede that instrument.

Whilst the English farmer has had much cause to anticipate the prospect of another bad season, the Americans have had as much reason to rejoice at the splendid weather with which they have been favoured. But the transatlantic farmer has enemies to guard against such as his English rival knows nothing of. Thus, in the *San Francisco Call* newspaper, we find a curious account of the means which are found necessary to protect the wheat-crops from the invasion of wild-geese, in a certain farm of seventy-five thousand acres in Colusa County, California. Forty men armed with rifles patrol this farm not only in the daytime but on every moonlight night. Flocks of geese—which, we are told, look from a distance like huge white blankets—settle down upon the wheat-fields, and make havoc of the crops, unless the riflemen are on the alert, and knock over a few of them by way of example. Sometimes a thick fog will come on, and then is the time that the geese will feed with impunity, for the men are afraid to use their weapons in case of mutual injury.

The electric light has found a novel employment in the hands of some ingenious Frenchmen, who have lately, by permission of their government, been experimenting with it as a lure for fish. The lamp was contained in an air-tight globe, and was lowered at night into the sea, with the result that thousands of fish of all sizes were attracted to its brilliant light. Boats furnished with nets gradually closed in upon the living mass and made a great haul of fish. We hardly know whether this mode of enticing the finny tribes will be considered quite legitimate by the angling and fishing fraternities.

At the recent distribution of prizes and awards in connection with the late Smoke Abatement Exhibition at South Kensington, it was stated that the Committee have determined that their labours shall not yet cease if they can obtain the support of the public to carry them on. They hope to be able to form a permanent Institute, which would have for its chief objects the promotion of schemes for the better utilisation of coal and coal products, the improvement of means for heating houses as at present constructed without producing smoke, and to deal with those subjects generally for the public information and benefit. Such a scheme should most certainly meet with cordial support from the dwellers in our large cities, where the increase of smoky chimneys is doing such damage to health and property.

In an article 'Simple Facts concerning Water,' we recently pointed out how hard water can be made soft by the addition of lime, and the theory of the chemical changes which occur. This method has long been known as Clark's process, and although thoroughly effectual, it has the disadvantage of requiring the water to be stored in precipitating tanks for about twenty-four hours before it is ready for use. A modification of this system, by which the water can be softened without being left to settle, has been introduced by the Atkins Water-softening and Purifying Company of 62 Fleet Street, London. In this system, a jet of lime-water is introduced into the liquid to be treated, which is then conveyed to a mixing-chamber, and afterwards to some rotary disc filters, where the precipitated lime is quickly collected on cloth-covered discs. The water, thoroughly softened, then flows onward for immediate use, or can be stored in reservoirs until required. This new method of dealing with hard waters has already been tried with success for some private water-supplies, and has now been adopted by the Henley-on-Thames Water-works. The Brighton Railway Company are also erecting the necessary plant for supplying their engines with softened water.

The invention and quickly increasing employment for various purposes of explosives such as nitro-glycerine, dynamite, and others of the same family, compared with which gunpowder is but a feeble agent, call for constant attention on the part of our legislature. It has been recently pointed out by the government inspectors that the railway Companies, in refusing as they do to carry such dangerous goods on any terms whatever, exhibit a short-sighted policy. Such things are easily concealed as ordinary luggage; and the railway Companies must know that in their trains, parcels containing them must often be surreptitiously conveyed. It would be far better to carry them—as acids and other dangerous commodities are now carried—by specially appointed trains, and with proper appliances to protect them from accidental ignition. It is a fortunate circumstance that most of these new explosives need percussion fuses to rouse them into full destructive fury, many of them burning harmlessly away if a simple flame be applied to them. It will thus be seen that dynamite is not such a treacherous fellow-traveller as might be supposed; still, we should be glad to see it relegated to a train of its own.

The recent exhibition at the Alexandra Palace of 'Means and Appliances for the Protection and Preservation of Human Life,' contained many inventions of a very interesting and valuable nature. It included a full-sized pair of facing-points fitted on a railway, showing the extension of the inter-locking system to all the various moving parts of the railway system; contrivances for preventing boiler-explosions; safety-lamps for use in mines, detectors of fire-damp, boat-lowering gear, and many other life-saving appliances. In the section devoted to life-belts and means for keeping the body afloat in the water, we noticed two exhibits which appeared to have the merit of novelty as well as efficiency. The first was the employment of powdered burnt cork for stuffing life-belts, ships' mattresses, cushions, &c.—giving greater buoyancy than the usual unburnt material. The other exhibit to which we refer consisted of life-saving garments. Most dresses of this kind are of a cumbrous and unsightly description, such garments, in fact, as no one would from choice carry about with him. But here we saw greatcoats, ladies' dresses, cut in the latest fashion too, so skilfully furnished in the linings with little cylinders of cork, that their presence was quite undetected until pointed out. People in the habit of yachting, or who are engaged in any occupation which brings them into daily chance of falling into the water, would do well to make further inquiries relative to this useful adaptation of the life-belt principle. The manufacturers are Messrs Wentworth & Co., of 12 Museum Street, London, W.C.

A few weeks ago, Mr Benjamin Askew delivered a lecture to the Royal Scottish Society of Arts, on the use of powdered stucco in the welding of cast steel; and in a day or two afterwards a Committee of the Society had an opportunity of witnessing at St Margaret's Works, Edinburgh, the welding of steel by the process described. The welding is done by means of powdered stucco used just as smiths are accustomed to use sand in other weldings. Four pieces of cast steel from two different makers were welded into one square bar, which was afterwards broken. The fracture showed no mark of the joining, but the grain of the two qualities of steel could be distinguished. Two old files were welded together and hammered into the shape of a chisel, which was then hardened, tempered, and sharpened, and used to cut an inch-bar of iron. The process is so simple that any skilled smith may practise it; he must use heat enough to flux, or melt, the stucco, but not so much as to fuse the steel.

OCCASIONAL NOTES.

SUGGESTED CURE FOR THE POTATO DISEASE.

ALL the way from Copenhagen comes a cure for the potato-disease. The cure is simple, inexpensive, and its author—Mr J. L. Jensen—says it is effective. The potato-disease, as most of our readers are aware, is caused by a fungoid growth which destroys the structure of the plant. The generally received theory is that the spores germinate—in wet weather—on the leaves of the plants, and that the fungus then spreads through

the plant's system, reaching and spoiling the tubers. Mr Jensen's theory is that it does not reach the tubers in that manner, but by the spores being washed by rain off the leaves into the soil; where, coming in contact with the tubers, disease is induced. Mr Jensen's cure is to earth up the potatoes high enough to afford protection. His method is to remove as much soil from one side of the row as will allow of the stems being bent over at an angle of forty-five degrees, and then to heap up the soil with the hoe—or with a plough of his own invention—to a depth of four inches over the tubers. This is made steep enough to shed the rain which washes the spores, not among the potatoes, but into the ditch thus formed. As Mr Jensen claims to have secured potatoes with no more than from one to three per cent. of diseased tubers, when others not so treated were smitten to the extent of thirty per cent., the plan is well worth a trial.

A writer in the *Gardeners' Chronicle*, hailing from Devonshire, claims to have practised the above method for a number of years with decided success. He learned it from an old labourer, who had always saved his crop by such means, when his neighbours had lost theirs.

ROD AND LINE FISHING IN NORTH UIST.

With reference to the article on the above subject which appeared in last month's *Journal*, we are requested by the proprietor to state that all the lochs, &c. on the island are preserved, more especially as regards 'salmon, sea-trout, and salmon-kind;' some of which, such as *Salmo salar* (salmon) and *Salmo eriox* (bull-trout), are, we are assured, occasionally taken.

AUTUMN LEAVES.

WHAT memories come, O Heart,
To thee in the Autumn chill,
When the leaves that have done their part
Are tossed at the cold wind's will?
When the sun that beamed so bright
Goeth down ere the day is past,
What shades dost thou see in the fading light?
What sighs dost thou hear in the blast?

Bright hopes have died like the leaves,
But, unlike them, no more shall bloom;
And the voice of the wind is like one who grieves
Alone, in a world of gloom!
The shadows I see are those
Who have passed from my side away,
And I hear them speak at the short day's close,
When the light is dull and gray.

And oft in the midnight lone,
When the world is wrapped in rest,
The fond hopes I once called my own
Rise living within my breast.
But soon, with a throb of pain,
I think of the leaves that fall,
And liken their forms to the hopes so vain
Which no Spring can recall.

PRICE 1½d.

A PEEP INTO AN ANTS' NEST.

THE name of Sir John Lubbock has long been connected with the subject of ants and bees, and he has obtained a foremost place among the investigators into this department of insect life. Yet his scientific work, laborious and exhaustive as it is, does not interfere with his performance of the duties which devolve upon him in his professional and political capacities as a banker and member of parliament. Amid all the demands which these duties make upon his time and energies, and which themselves might be deemed sufficient employment for any one man, he yet finds time to pursue his favourite studies in natural history; and the books and papers which he has issued thereon are not more remarkable for their revelations of insect and plant life, than for the evidence they give of most laborious and painstaking research on the part of the writer. Sir John Lubbock has recently issued a new volume, the result of ten years' experiment and observation, entitled, *Ants, Bees, and Wasps* (London: Kegan Paul, Trench, & Co.), some of the interesting and startling facts of which, so far as they relate to ants, we propose to bring before our readers.

Ants have long afforded amusement and wonder to observers, on account of what might be called their near approach to human intelligence, as exhibited in their social organisation, their large communities, their elaborate habitations, their education of their young, their military tactics, their construction of roadways and bridges, and their possession of domestic animals, and even, in some cases, of slaves. In this country we have more than thirty kinds of ants; but they become much more numerous in species, as well as individuals, in warmer countries, more than a thousand different species being known to exist. The author tells us that he has kept in captivity about half of our British species of ants, as well as a considerable number of foreign forms, and for the last few years he has generally had from thirty to forty communities under observation. After

trying various plans, he found the best way to keep the ants was in nests consisting of two panes of common window-glass, about ten inches square, laid flat one above the other, but kept apart to a distance of a quarter of an inch or less by thin slips of wood round the edges, the space between the panes being filled up with fine earth, in which the ants devise such compartments as they require. The object of restricting the space between the panes of glass to a quarter of an inch or so, is that the ants may not be able to hide themselves from observation, which they would be likely to do were there a greater depth of earth. Moreover, there being glass below as well as above, the movements of the ants can at all times be well observed. These nests are placed on a stand, one above the other at intervals apart, but arranged so that each nest can be detached for purposes of special observation. Various means also, such as surrounding their nests with water, are taken to prevent the ants from escaping, or passing from one nest to another. These nests afford special facilities for observing the internal economy of ant-life; and especially for watching and recording the actions of individual ants. For this purpose, the particular insect to be watched requires to be marked, and the most convenient mode of marking them was, he found, either with a small dab of paint on the back, or, in the case of bees or wasps, by snipping off a minute fragment at the extremity of the wing. This, from the structure of the wing, gives the insect no pain, nor does it interfere with its flight.

No two species of ants, says Lubbock, are identical in habits; and, on various accounts, their mode of life is far from easy to unravel. In the first place, most of their time is passed underground; all the education of the young, for instance, is carried on in the dark. The life of the ant falls into the four well-marked periods usual with insects—those of the egg, of the larva or grub, of the pupa or chrysalis, and of the perfect insect or imago. The eggs are white or yellowish, and are said to hatch in fifteen days;

but those observed by Lubbock have taken a month or six weeks. The larvæ are small, white, legless grubs, which that section of the ant-communities called workers carefully tend and feed, carrying them about from chamber to chamber, probably in order to secure for these baby ants the most suitable amount of warmth and moisture. The larvæ, also, are very often assorted according to age. The author remarks that it is sometimes very curious to see them arranged in groups according to size, so that they remind one of a school divided into five or six classes. When they enter the chrysalis state, some of the larvæ are covered with silken cocoons, others remain naked. The reason of this distinction is not yet understood; but the curious fact is noted, that as a general rule, the species which have not a sting, spin a cocoon, while those which have a sting are naked. After remaining some days in the chrysalis state, they emerge as perfect insects. In many cases, however, they would perish in the attempt, if they were not assisted; and it is very pretty, says Sir John Lubbock, to see the older ants helping them to extricate themselves, carefully unfolding their legs and smoothing out the wings, with truly feminine tenderness and delicacy.

Under ordinary circumstances, an ants' nest, like a beehive, consists of three kinds of individuals, namely, workers or imperfect females (which constitute the great majority), males, and perfect females. There are, however, often several queens in an ants' nest—these queens being provided with wings; but after a single flight they tear them off, and do not again quit the nest. Very young ants devote themselves at first to the care of the larvæ and pupæ, and take no share in the defence of the nest or other out-of-door work until they are some days old. This seems so arranged because at first their skin is comparatively soft, and it would be undesirable for them to undertake rough work or run into danger until their armour had had time to harden. When they are sufficiently strong, they join the workers, and their education may then be said to have begun. The division of labour among the ants is still further developed. Among the slave-keeping species, the mistresses, for instance, never go out themselves for food, leaving all this to the slaves. Others, again, send out foraging expeditions, certain ants being told off for this purpose; and if any member of the expedition is taken prisoner or otherwise prevented from returning to the nest, it is observed that another ant is sent to replace it.

The food of ants consists of insects, great numbers of which they destroy; of honey, honey-dew, and fruit; indeed, scarcely any animal or sweet substance seems to come amiss to them. They are, however, particularly fond of honey, and one species of ants, from Mexico, take a very curious way of storing it up for use. This is by selecting certain individuals among them to act as receptacles of food—serving indeed as animated honey-pots! To them the foragers bring their supplies, and their whole duty seems to be to receive the honey, retain it, and redistribute it when required. These living honey-jars are packed till the abdomen of the creature is distended to many times its own bulk; consequently, as might be

expected, the ants so used are not able to eat food are very inactive. It is not known that any English species practise this extraordinary method of storing food.

Ants have, further, a human-like inclination for keeping domestic animals. Some species, such as the small brown garden ant, keep tiny aphides (a kind of green plant-lice) as milk-cows. They go out and ascend bushes in search of them. When the ant finds one, she strokes and caresses the aphid gently with her antennæ, and the aphid emits a drop of sweet fluid, which the ant imbibes. Sometimes the ants even build covered-ways—a kind of cow-sheds of earth—for the aphides, which moreover they protect from the attacks of other insects. But this is not all. The yellow ants collect the root-feeding species of aphides in their nests, and tend them as carefully as their own young. And they not only guard the mature aphides, which are useful, but also the eggs of the aphides, which of course, until they come to maturity, are quite useless. Nor is the aphid the only domestic animal kept by the ants. Another class of ant-guests are those which reside actually in the galleries and chambers of, and with, the ants, but which the latter never harm. Of these, the commonest in England is a species allied to the Podura—a kind of wingless insects, known, from their leaping powers, by the name of skip-jack or spring-tail. The member of this species which the ant favours is an active bustling little thing, which runs about among the ants, keeping its antennæ in a state of constant vibration. Another guest of the ants is a sort of white woodlouse. Both of these last-mentioned favourites are blind, probably, says Lubbock, from living so constantly in the dark. 'It is certain,' he adds, 'that the ants intentionally (if I may so say) sanction the residence of these insects in their nests. An unauthorised interloper would be at once killed. I have, therefore, ventured to suggest that these insects may perhaps act as scavengers.'

With the exception of the aphides, the guests just mentioned have no particular attention paid them by the ants. But this is not the case with still another favourite, which, by the way, is also blind. This is the curious little beetle called *Claviger*—from its club-shaped antennæ—which is quite blind, and appears to be absolutely dependent upon the ants. 'It even seems to have lost the power of feeding itself; at anyrate, it is habitually fed by the ants, who supply it with nourishment as they do one another.' The ants are evidently careful to keep these tiny beetles clean, as they are seen frequently to lick the whole upper surface of the body. On one occasion, an observer saw a beetle fed by an ant. Several ants were sucking a morsel of sugar, when the beetle approached one of them, and tapped her several times on the head with its antennæ. The ant then opened her mandibles, and fed the beetle as she would have done one of her own species. The beetle crept upon the sugar, but did not appear able to feed itself. The author thinks it not altogether impossible that some of these same insects may be kept by ants merely as pets.

Among ants, as a rule, each species lives by itself. There are, however, interesting exceptions, some small species being found exclusively

in the nests of certain larger species. It is not known, however, what the relation between these species is. In one case, when the large ants change their nest, the smaller species are seen to follow them, 'running about among them and between their legs, tapping them inquisitively with their antennæ, and even sometimes climbing on to their backs, as if for a ride, while the large ants seem to take little notice of them. They almost seem to be the dogs, or perhaps the cats, of the ants. Another small species, which makes its chambers and galleries in the walls of the nests of larger species, is the bitter enemy of its hosts. The latter cannot get at them, because they are too large to enter the galleries. The little species, therefore, are quite safe; and, as it appears, they make incursions into the nurseries of the larger ant, and carry off the larvæ as food. It is as if we had small dwarfs, about eighteen inches to two feet long, harbouring in the walls of our houses, and every now and then carrying off some of our children into their horrid dens.'

There is another striking feature in the social organisation of ants which we must notice; that is, their habit of keeping slaves. Most ants will carry off the larvæ and pupæ of other species if they get a chance; and this throws light upon that most remarkable phenomenon, the existence of slavery among them. 'If you place a number of larvæ and pupæ in front of a nest of the Horse ant, for instance, they are soon carried off; and those which are not immediately required for food remain alive for some time, and are even fed by their captors.' This is not, however, a confirmed habit with the Horse ant; but there is an allied species, which exists in some of our southern counties and throughout Europe, with which it has become an established practice. These ants make periodical expeditions, attack neighbouring nests, and carry off the pupæ. When the pupæ come to maturity, they find themselves among others of their own species, the results of previous predatory expeditions. They adapt themselves to circumstances, assist in the ordinary household duties, and, having no young of their own species, feed and tend those of their mistresses.

This species of slave-holding ants, while aided in their duties by their slaves, do not themselves lose the instinct of working. But there is another species of slave-holders, the Amazon ant, which do, and which have become almost entirely dependent upon their slaves. They indeed present a striking picture of the degrading tendencies of slavery. 'Even their bodily structure has undergone a change; the mandibles have lost their teeth, and have become mere nippers—deadly weapons indeed, but useless except in war. They have lost the greater part of their instincts: their art, that is, the power of building; their domestic habits, for they show no care for their own young, all this being done by the slaves; their industry—they take no part in providing the daily supplies; if the colony changes the situation of its nest, the masters are all carried by their slaves on their backs to the new one; nay, they have even lost the habit of feeding. Huber placed thirty of them with some larvæ and pupæ, and a supply of honey, in a box. "At first," he says, "they appeared to pay some little attention to the larvæ; they

carried them here and there, but presently released them. More than one-half of the Amazons died of hunger in less than two days. They had not even traced out a dwelling, and the few ants still in existence were languid and without strength. I commiserated their condition, and gave them one of their black companions. This individual, unassisted, established order, formed a chamber in the earth, gathered together the larvæ, extricated several young ants that were ready to quit the condition of pupæ, and preserved the life of the remaining Amazons." This observation,' adds Lubbock, 'has been fully confirmed by other naturalists. However small the prison, however large the quantity of food, these stupid creatures will starve in the midst of plenty rather than feed themselves.'

We must now say something about the military tactics of these wonderful little creatures. Different species have their several peculiar modes of fighting. One species, for instance, never attack, and scarcely ever defend themselves. Their skin being very hard, they roll themselves into a ball. Another species has the habit, like reynard, of feigning death as a means of self-protection. But there are other species who are regular Zulus. Amongst these is the Horse ant, before mentioned. This ant, when it goes to war, attacks in serried masses, seldom sending out detachments, while single ants scarcely ever make individual attacks. They rarely pursue a flying foe, but give no quarter, killing as many enemies as possible, and never hesitating, with this object, to sacrifice themselves for the common good. Another species have a similar mode of attack, and when in close quarters they bite right and left, dancing about to avoid being bitten themselves. When fighting with larger species, three or four of them seize upon an enemy at once, and then pull different ways, so that their big antagonist cannot get at any one of her foes. One of them then jumps on her back, and cuts, or rather saws, off her head. The Amazon ants, whose dependence for food and comfort upon their slaves has been already described, are, however degraded in a civil sense, terrible gladiators when there is fighting to be done. Their jaws are very powerful and pointed: and if an individual of this order is attacked, she at once takes her enemy's head into her jaws, closes her mandibles, so that the points pierce the brain of her enemy, paralysing the nervous system, the victim falling dead in convulsions. In this manner, a comparatively small force of these Amazons will fearlessly attack much larger armies of other species, and themselves suffer scarcely any loss.

We cannot conclude without some allusion to the more strictly social—we had almost said moral—behaviour of ants. As regards their treatment of their distressed neighbours and friends, Sir John Lubbock, after numerous interesting and amusing experiments, is unable to give the little creatures a very good character. Hatred is much stronger than affection among them. He has indeed often been surprised that in certain cases ants render one another so little assistance. If an ant is fighting with one of another species, her friends rarely come to her assistance, passing by, and not even stopping to look on. In the case of ants in a half-drowned

condition, which the author placed in the way of their friends going between the nest and their feeding-ground, individual ants would pass their insensible neighbour eighteen and twenty times, and never once pay the slightest attention to her. Our author thinks there is evidence that ants are less tender to friends in distress than previous observers have stated to be the case; though at the same time he finds such individual differences existing as to warrant him in concluding that there are good Samaritans, as well as Priests and Levites, among them, as among men.

The general carelessness or heartlessness of ants to each other when in distress does not arise from their inability to recognise each other. Although a community of ants will sometimes number as many as fifty thousand individuals, yet the ants of the community all recognise one another. Even when ants are removed from a nest in the condition of pupæ, but tended by friends, if reintroduced into the parent nest, they are recognised and treated as friends. Pupæ taken away in the same manner, and brought up by ants of another species, are, when returned to the parent nest, equally well recognised by the general body of their friends, though occasionally some relatives are puzzled. How this recognition between ants is effected, cannot definitely be said. Lubbock's experiments do not lead him to think that ants of the same nest recognise one another by means of a sign or password. It has been supposed by some observers that ants recognise one another by smell; but this does not meet with our author's support; as it is difficult, considering the immense number of ants' nests, to suppose that each community can have a separate and peculiar smell.

There are many other features in connection with ants and ant-economy that might prove of interest to our readers, but which space does not permit of our entering upon. The book, however, which has formed the subject of this notice, is sufficient to satisfy the most rapacious inquirer; and the numerous experiments which are here so carefully and elaborately detailed, enable the reader, almost equally with the author, to judge for himself as to the conclusions that are drawn. The book cannot fail to add largely to the already high reputation of Sir John Lubbock in the scientific world.

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

BY DAVID CHRISTIE MURRAY.

CHAPTER XXXIV.—'DID THE RETURN OF ONE OF HER LOVERS PLEASE HER, EVEN THOUGH HE WERE NOT THE CHOSEN?'

WITH no more than a casual glance at his solitary travelling-companion, Gerard folded himself in his rug and disposed himself to sleep. Val found the situation eminently trying. He had made a sacrifice to honour on the clear and definite understanding that he was not to lose by it. It was a direct bid for a bargain with Fate, and Fate had declined to accept the bond of the bargain. He was positively losing by his sacri-

fice after all, and for once in a way, honesty was not the best policy. It is undeniable that Honour is a hard mistress to such as serve her with divided hearts. She will have everything her own way, or—she punishes. She will not tolerate anything done for reward. She is the desert of reward, and not the payment of it. Val had obeyed her with a divided loyalty, and was already far advanced on the track of repentance. Mr Charles Reade says, with that savage incisiveness which belongs to him, that our truest repentances are reserved for our best actions. That is a hard and bitter saying; but there is truth in it, if it is not altogether true; and here was Val bewailing himself that he had not held the master-card and played it, though the Knave's face grinned from the cardboard. If honour's path were smooth, would we not all rather tread in it than otherwise! Who will invent some scheme of self-sacrifice-made-easy, and invite us all to purchasable saintship? No man elects to be a rogue, for the sake of being one. To despise one's self is no luxury.

If you desire to know how all the obstacles he met with swelled Val's passion, you may find for yourself a world-old illustration by dropping an impediment in the first country streamlet or town gutter you may come to. How the small stream suddenly swells and rages! Do but grant that its sources will not dry up, and that you go on building up impediments, and out of any village runlet you may secure a flood which, breaking loose at last, will sweep away houses. And Val's love, which, if its current had run smoothly, might have been a placid stream enough, had long since grown torrent-like and overwhelming.

Gerard had been in his way all along, but now he barred Val's physical egress from this unpleasant corner. Placidly sleeping, he stretched his legs from one seat to the other, and there was no getting past him without the chance of recognition; and Val, for his own purposes, was anxious not to be recognised. Constance was free to accept the proffer of any man's hand, and Val was of course equally free to make proffer of his own; but it was natural that he should not care to be met by his rival on a journey which had that end in view. The train made its customary stoppages, and at each of them he would willingly have escaped to another carriage; but he did not choose to venture on the experiment. In spite of his loss of sleep the night before, Gerard's presence kept him awake, and at every stir the sleeper made, he fixed his protecting collar anew and gave a tug at his travelling-cap. But the sleeper went on sleeping to the journey's end, and therein took another unconscious advantage, of which Val was conscious. Sullenly determined not to be recognised, Val coiled himself in his corner until Gerard had gathered up his belongings and had left the

carriage. But if he were to preserve his presence as a secret, he must seek another hotel than that in which Constance and Gerard would alike be domiciled, and thus would he be at a new disadvantage. Well, then, he would accept the chance of observation, and with this resolve he followed into the *Grand Hotel*, and after a bath, sat down to write a note, informing Constance of his presence, and begging her most urgently to see him.

In the meantime, Gerard, having made his toilet, had already shaken hands with Mr Jolly and with Reginald. He had not been aware of the race against a rival; but he had wired that he was coming, and they had both arisen early to meet him. Mr Jolly was prepared to protect his daughter from any renewed proposals from the bankrupt lover. Reginald was ready if need were to come in as a moral buffer between the forces which seemed certain to attack each other. The elder man was posed in an attitude of conscious dignity when Gerard entered. The lad's face was radiant as he came in, and he advanced with both hands outstretching.

'Congratulate me!' were his first words. 'Everything that fellow Garling ran away with, is recovered!'—Mr Jolly's attitude of dignity went suddenly to pieces, and he was all amazement.—Gerard told the story briefly, and explained exactly how matters stood. He told by what strange accident the missing papers had been discovered; and at the mention of Val Strange's name, the younger listener hid himself behind his eyeglass and gave vent to an expressive whistle, which neither of the others noticed. Mr Jolly had a good deal to think of, and not a great deal of time in which to turn it over. The firm would start again, so Gerard said, in answer to inquiry: everybody had been paid to the uttermost farthing; the news of the recovery of the stolen capital would be bruited abroad; and the House would stand as well as ever in the eyes of the world. That was all well; but in the meantime Gerard was undoubtedly many thousands poorer than he had been. Still, at his father's death he would have everything—a hundred and thirty thousand pounds, a noble house and a fine park, his mother's fortune—whatever that might amount to—and a share in the profits of the rehabilitated firm. Yes—perhaps he might risk assent again. Constance was fretting a good deal, and Mr Jolly had a hundred times declared that women were incomprehensible. She had treated the man as if he had been one icicle and she another, whilst she was sure of marrying him; and now that she had lost what apparently she had never cared for, she was moping and melancholy, and in love with solitude. The girl was evidently grieving for him. Let her have him back. Poor Mr Jolly's life had been a burden these six weeks. From the hour of her mother's death, Constance's future had been a trouble to him; and just when, with unexpected ease and good fortune, he had shelved

the weight, and was prepared to enjoy the world—an unencumbered widower—she had come back upon him, and the brilliant engagement had ended in a tragical fiasco. Of course he did not guess that any other trouble weighed upon his daughter's mind, but the tears that seemed shed for Gerard were mainly shed for Val's desertion of her. She had not wept long, but a settled languor was upon her still, and the world seemed to have lost all charm and interest. When he had rapidly turned over such of these considerations as occurred to him, Mr Jolly spoke.

'My dear Gerard,' he said, in his Disraelian manner, 'when you first approached me upon this question, I did myself the justice to assure you that I had but one object to achieve, and that that object was my daughter's happiness. If I had not thought you likely to promote the attainment of that object, I should never have encouraged you in your approach to her affections.'—The profane Reginald murmured 'Hear! hear!' and his undertone was so ill-measured that the interruption was audible to his father.—That ideal parent turned a glance of reproach upon him, and continued: 'Approach to her affections. For I am not one of those who would consent to see marriage degraded to the level of a sordid tie, or reduced to the baseness of a business negotiation.' He felt himself to be in fine oratorical form, and would have been glad to admit all English-speaking people then in Paris, that they might see how well he bore it off. There was always a shadowy audience in his mind when he laid himself out in the pursuit of conversational excellence. He felt now—in a nebulous, vague way, be it understood—as if he harangued the inhabitants of listening spheres, and that he was more like his model than common. 'With that candour which has always seemed to me one of your most attractive characteristics, you tell me that your financial position is not altogether what it was. If the financial position'—he said this with a playful flourish and a smile—'had been your only recommendation, that would have weighed against you. But, as matters stand, I resume my old position. I take a position of friendly neutrality, Gerard. You did not consult me when, in pursuance of the dictates of an honourable delicacy, you withdrew from your engagement; or perhaps I might have been unworldly and unwise enough to combat your resolve. You do me the honour to consult me now; but I waive all right of veto, and I refer you to the person most interested. I preserve my neutrality strictly, but I wish you well. I have no influence, or if I possess influence, I conceive that I exercise my parental duties best by refusing to exert it. God bless you!' Mr Jolly suddenly and unexpectedly wrung Gerard's hand, and producing his handkerchief, gave it a solemn flourish and hid his countenance. It is probable that he had not the remotest notion of being a humbug. If he began by expressing his own magnanimity, he always ended by believing in it.

Gerard knew him better than of old; but he was not keen in observation; and he liked to believe in people; being himself of a most honest and faithful nature. So he returned the grip

with interest, and left the model father's knuckles limp and aching. Reginald meanwhile smoothed his baldness with a doubtful grin, expressive of a sentiment half-way between shame and amusement. And if he kept silence with respect to his father's emotion, it may be that he thought the more. His own congratulations were brief and hearty.

'Look here,' he said; 'I'll go and tell Constance you're here;' and with that intent he sped in search of Miss Lucretia's maid. It so happened that Val's servant was at the moment of Reginald's arrival on the scene in search of that damsel, being intrusted to deliver to her care his master's note. The wily youth saw him, and marvelled. 'Is Val here?' he asked himself. If he were there, it could be for but one object. Reginald's sympathies, like other things human, were liable to fluctuations. He had been moved by Val's distress when he parted with him; but he had been moved since then by the tremendous calamities which had fallen upon Gerard. Val had not acted altogether well in pursuing Constance after her engagement to Gerard; whilst his rival had borne himself, to Reginald's mind, splendidly, beneath misfortunes almost unexampled. So that now the balance of Reginald's sympathies was with Gerard. But bethinking himself that Strange had had it in his power to delay his rival's good-fortune, he appreciated his honour at the full, and being thus tugged by both, he decided not to interfere with either. 'Let 'em fight it out between 'em,' he said viciously. But by intercepting Miss Lucretia's maid, he interfered without knowing it. 'Is my sister up?' he asked.

'O yes, sir,' the maid responded; 'she took coffee half an hour ago.'

'Did she, my dear?' he returned with a fatherly air. 'Well, it's of no use for me to make love to you, because I know the noble Duke your father won't let you marry out of the Harry-stocracy, and I'm as poor as Job. So just you run and tell her that I want to see her. Will you? There's a darling!'

The damsel murmured something, of which 'Imperence' alone was audible, and departed on her errand with an air of scorn. But being out of sight, she stopped to giggle.

'They're very nice,' said the bald-headed young man, putting up his glass to look after her—'they're very nice, all of 'em; but are they worth the trouble we take about 'em?'

The maid returned before he had found an answer to that query. 'Miss Constance says you will see her in her dressing-room.'

'I'll say nothing at all about Val,' Reginald decided as he entered his sister's room. Constance sat at the window, and looked at him with a languid and uninterested air as he entered. To her surprise, he kissed her before sitting down. 'Con, my dear,' he said, 'I have news for you. Who do you think is here?'

'I never cared for riddles,' she answered. 'Who is here?'

'Gerard came from London this morning. He has recovered all the stolen money, and is nearly as well-off as ever. He wants to see you. Will you come to him?'

Now, this was not altogether leaving the rivals to fight it out between themselves; but then you

and I are not the only inconsistent people in the world. He was beginning to get interested in spite of himself. Constance was very pale of late, but at this news a gentle colour stole to her cheek. Did the return of one of her lovers please her, even though he were not the chosen? The six weeks and more which had gone since Val's departure had not left her unchanged. For six weeks she had been free and lonely. Val had expatriated himself, and at his going, she had done her deliberate best to root him from her heart. Then she had pitied Gerard, and had felt more kindly to him since his misfortunes. She had seen his honest clear gray eyes clouded with the agony of his sorrows. She had thought often of that despairing gesture with which he had turned away from her, and the eloquent cry, low yet terrible, with which he had released her. She did not love him; but she was not devoid of pity, and she was left alone. And operating with these factors of pity and loneliness was the fact of his former claim. Had the two men stood side by side, she would not have chosen Gerard. But the man she would have chosen had gone away on purpose to forget her, and she had schooled herself to know it. She remembered how deeply interested her father had been in Gerard's success, and supposed the interest renewed. In these late days, life had had neither salt nor savour. And so in brief she resigned herself, and when Reginald asked his question, she responded 'Yes,' and arose languidly, yet with a little blush upon her cheek, born of I know not what emotion.

She was dressed in some light-coloured diaphanous stuff which had soft and graceful folds, and she wore just a touch of warmer colour at the throat. To Gerard's eyes, as she approached him, her pallor and her languor lent her a new beauty. But he had never seen her without thinking that she looked more beautiful than ever. And now he was lover all over, and trouble vanished, and care took flight. He kissed her hand, purely and simply because he could not help it, despite the presence of her father and her brother. Mr Jolly made a second oration in parliamentary form. Reginald left the room to escape it, and neither Gerard nor Constance paid much heed to it—Gerard, because he was filled with his own happiness; nor Constance, because her father's heavy solemnity of platitude was always wearisome. Pleasantly unconscious of this tacit disdain, the model father flowed along. He took Constance's approval for granted, and evidently regarded a renewal of the engagement, under the conditions, as a thing needing his own consent and nothing more. She had supposed that this was his view of the affair; and, for her—what did it matter? By-and-by, the model parent having sufficiently aired himself, withdrew, and there came an hour which made Gerard an atonement for his griefs. He knelt at Constance's side with both her hands in his, and eloquent for once in his life, he told her how more than happy he was; and how more than wretched he had been.

'And you have grieved for me too,' he murmured, kissing her hands again and again. A man whose scholarship goes no further than the Latin quotations at the end of a pocket edition

of Johnson, knows—*Credula res amor est*. She was pale, and ah! it was sweet to think she had grown pale in grieving for him, so sweet he could but think it. And she would give no denial. Why should she pain him? He had suffered, and he loved her, and it was in her power to make him happy, and it was worth something in a world so forlorn to be able to make anybody happy. And let not the male reader accept this as a commonplace. It was proof of a nature which was at bottom indubitably noble. For, as a rule, a woman—as the greatest Englishwoman of this century has told us—discerns not a sex as we do, but an individual. She loves one—one who belongs to her: she has no passion for humanity. Loving Dick, she deifies him, but is quite contemptuous about Tom and William, who are all round ten times better fellows; and should Tom or William make love to her, she snubs him, and despises him for it. That Dick loves her, is Dick's glory and her own; but a planetful of outside males might kneel and she deride. It was, then, anything but a feminine trait in Constance that she listened with pity and yielding to the love-tale of a man she did not love. Her hands were cool in his grasp. Her pulse beat no faster because of his kisses and his vows. Since Fate resigned her to him, she would be true to him; and if she could make him happy, it was something. But she—had she ever been happy? Would she ever be happy any more?

Then, not to break, but to continue Gerard's dream, came breakfast. It was his first happy meal for so long, and it is true, as John Dryden sang, 'sweet is pleasure—sweet is pleasure after pain.'

'I protest,' said Reginald, scrutinising a cutlet, and appropriating it, 'that I feel Arcadian. Let us go and picnic somewhere. It is going to be a lovely day. Let us go to St-Cloud or to the Bois. Let us go to the Bois, and take a hamper, and lunch in the shade like M. Lebon Epicier and his house on a summer Sunday. —Eh, governor?—What do you say, Aunt Lucretia?'

'Let us go to St-Cloud by all means,' returned the old lady. She was in a condition of tremulous happiness at Constance's recovery of her lover, and had already taken a fancy to Gerard. To be sure, his affairs were no longer colossal, which was of itself a pity; but he was so big and genial, so bright and tender and devoted, that her heart warmed to him.

'Shall we go, Constance?' asked Mr Jolly.

'By all means,' said Constance, trying to look as if the proposal pleased her.

'I haven't seen St-Cloud since I was a boy,' said happy Gerard. So the jaunt was reckoned settled. The sleeping and dressing rooms occupied by Mr Jolly and his son were *en suite* with the breakfast-room, but the ladies slept at the end of the corridor. Constance gave her arm to Miss Lucretia, and the faded old woman and the beautiful girl went out together, making a pretty picture. The rooms Val Strange had taken opened on that corridor, and he saw them as they passed his open door. All this time whilst Gerard had been happy, Val had been waiting in suspense, and torturing himself with fears, which were better grounded even than he feared, for his hope

fought them half down, and would not give them sway. Two minutes later, Gerard passed, elate, with his head high and a radiant smile upon his face, humming *La donna e mobile*. The broad staircase faced Val's door, and Gerard went springing up it three steps at a time.

'He has won!' cried Val wildly; and with a savage gesture, he slammed the door and cast himself into a chair. The very carriage of Gerard's figure bespoke triumph; the gay air he hummed, the smile upon his face, sang triumph! 'Won? Has he won? He laughs best who laughs last, and I will win or die. She does not care for him. Fool that I was to run away. Had I stayed in England, she would have been mine by now, and no man could have come between us. O Constance! Not a word yet? not a line? Do you know that I am here?'

When Constance reached her own room, Miss Lucretia's maid presented her with a note. The handwriting was not known to her; and turning first to the signature, she was seized with a sudden tremor, so that the very paper rustled in her hand. The maid looked at her curiously. 'You may attend your mistress,' said Constance quietly. 'I shall not trouble you this morning.'

Mr Jolly, after the failure of Lumby and Lumby, had begun to retrench. He had spent a good deal of money on the strength of Constance's engagement, and when it seemed that nothing was to come of it, he retrenched. With Mr Jolly, retrenchment naturally tended to the docking of other people's little comforts rather than his own, and one of his economic measures was to refuse vote of supply for Constance's maid.

'I returned to England two days ago,' ran the note, beginning thus abruptly and without preface, 'and learned that you were free. I should have been here a day sooner, but I waited to restore Gerard's fortune to his hands. I could not rob him of everything. I will explain this when I see you. You will let me see you for a moment? You know my love already. I can speak now without dishonour, and can tell you that I love you still, that I have loved you from the hour I first saw you, and shall love you to the last hour of my life. You know all this already. I have waited, and I have despaired; but new hope brings new pain. Forgive me, if I seem to say too much, or if I seem to say it too unguardedly.—Yours, V. S.'

She sat for a long time over these impassioned words. To you or to me, they may seem no more than words, and 'like a tale of little meaning, though the words are strong.' But eloquence is in the ears that hear more than the tongue that speaks, and with every word she read—true sign of love—she heard Val's voice pleading in it. He had been so near after all; and in place of mere cold duty, she might have had love and no breach of duty with it, had she been spared from Gerard for but two hours. Her tears fell heavily upon the paper, like the drops that fall at the beginning of a storm. She kissed the honeyed cruel words that told of the love she longed for; and suddenly starting up, she thrust the letter in her bosom, and began to dress. She would tell Gerard how unhappy she was, and beg him to release her. Her plighted word of half a year since still bound her after this morning's

tacit re-acceptance of the bond. But Gerard was a man and a man of honour. He would release her if she claimed release, and she would claim it. She could almost love him if he let her go.

Her mind being made up to this, she recurred to the mysterious phrases in Val's letter—'I waited to restore Gerard's fortune to his hands. I could not rob him of everything.' Being unable to find any meaning for them, she sought her aunt's room. 'Aunt dear,' she said, 'I have not heard how the fortune came back again. Can you tell me?'

'I am not a business woman, my dear,' said Miss Lucretia, whose gray locks were just then in the hands of her maid; 'but, as I understand the matter from your father, a friend of Mr Lumby's found the money—a Mr Grainger. I wonder if he were one of the Essex Graingers? I knew the Essex Graingers years ago. They were very prying people, and quite likely to find anything that was hidden anywhere.'

'Was it not Mr Strange who found the money?' asked Constance—'Mr Valentine Strange?'

'Was it?' cried the old lady. 'Valentine? What a stupid way of speaking, your father has, my dear. He puts *er* at the end of everything. O yes, my dear. Of course it was Valentine Strange. He has a paper-mill. O yes, of course. And he found the money in bank notes—a million pounds' worth, only some of it belongs to other people—and the poor mad gentleman is supposed to have hidden them in the waste-paper after the other gentleman had stolen them. Although of course it is absurd to speak of *him* as a gentleman. I am so glad to know that it was Valentine Strange.'

Constance was not greatly enlightened as to the history of the case, but she understood enough. Val would not rob Gerard of his fortune for an hour, or take away his chance of an appeal to her. 'He shall not be unhappy,' she said to herself, 'because he has acted so nobly, and has waited to give his rival a chance before he spoke. How splendid of him! How manly! How chivalrous!'

She resolved anew that she would appeal to Gerard; but she had reckoned without herself, for when he and she were left alone that day at St-Cloud, she could not find courage to speak. She put it off. She would write to him. It would be easier to write. And Val meantime went unanswered, and saw them going away, and watched them, hours after, as they came in again, himself unseen. As Constance walked along the corridor to her room that night, Gerard overtook her at Val's door, and not guessing who waited and listened there, he said good-night with a tender triumph in his tone at which Val clenched his hands and maddened.

'Good-night, darling,' said Gerard. 'Can you guess how happy you have made me? Good-night.'

'Good-night, Gerard,' returned Constance. She wanted so much to propitiate him, she dreaded so much to give him pain, that her voice was tenderer than she knew. How could she be so cruel as to dismiss him? How could she be so cruel to herself and Val as not to dismiss him? Gerard with one foot on the staircase watched

until the door closed behind her, and then went slowly up the stair. Val's pale face from his dark chamber doorway looked after him.

'She has left my note unanswered all day long,' he moaned. 'If I have been mistaken! If she loves him after all! If'—

RECENT EXPERIMENTS IN SCIENTIFIC AGRICULTURE.

PHOSPHATE of lime, as found in bones, has long been a favourite manure with farmers, especially for root-crops, and so great has been the benefit derived from the use of 'dissolved bones,' that the supply has had to be supplemented from mineral sources. At first, bones were simply crushed, or ground to a coarse, sawdust-like powder; but latterly, superphosphate has been found more active and beneficial to the crop to which it has been immediately applied. The consequence of this is that bones are now generally treated with sulphuric acid, whereby most of the phosphate of lime is rendered soluble; and by this process the superphosphate is obtained. By reason of its solubility, this substance is very easily distributed through the soil, where it speedily takes up lime, and becomes again of the nature of bone-earth. The old idea was that it was quickly absorbed by the roots of plants, by reason of its solubility; but it is now generally agreed that its superiority lies in its distributive powers.

In practice, it has been found that soluble phosphates from bones, and from such mineral phosphates as coprolite, are identical in composition and in value; hence, manufacturers use mineral phosphates largely in the use of phosphatic manures; indeed, such have become necessary, for the demand is so great, that bones sufficient to supply it are not forthcoming. But while dissolved phosphates have always been valued, undissolved mineral phosphates have been regarded with but scant favour. Even the bone-ash which manufacturers have so largely imported from South America and elsewhere—derived from the cattle which are slaughtered for the sake of their hides, tallow, and bones, and the dried bones and flesh used as fuel—has been hitherto considered of little value unless treated with sulphuric acid. That this conclusion has been too hastily arrived at, seems evident in the light of recent experiments, some of which we propose laying before our readers.

The question is an eminently practical one, for the preparation of phosphates by sulphuric acid is a costly process. If—as there seems little room to doubt—phosphates can be rendered equally efficacious by a much cheaper method, and equally large crops raised for considerably less outlay, the question becomes one of national importance, and supremely so to farmers and landlords. In some recent experiments in Aberdeenshire and in Sussex, 'economy was reached by mixing the cheapest phosphate (*ground coprolite*) with that sold at a moderate cost (*steamed bone-flour*). Of roots only—not taking into account the wheat-crop—there were about seventy-one thousand acres in Sussex, and assuming that out of thirty shillings which is calculated to be annually spent per acre, one-third, or ten

shillings, could be saved by using *undissolved* phosphate, the saving in Sussex alone would be over thirty-five thousand pounds annually.' These words are from a Report by an able chemist specially deputed to experiment with manures in the county of Sussex; and the results amply bear out what has been quoted. As a universal opinion is almost wholly against this view being realised, we will quote some of the results obtained.

The first experiments that we are aware of where soluble and insoluble phosphates were fairly pitted against each other, were those conducted in Aberdeenshire a year or two ago. After some preliminary experimenting, it was resolved to try a mixture of coprolite and steamed bone-flour against an equal quantity of crushed bones and dissolved bones. The results were practically the same—only the first mixture cost twenty-eight shillings, while the other cost forty-two shillings.

After the experiments had been repeated for some time on the same soil, it was found that the disease which attacked the turnips was invariably aggravated on the plots to which *dissolved* bones had been applied. The evidence went to show that the disease was associated with a fungus on the one hand and with sulphur on the other. As turnips are distinguished from other plants by a volatile oil rich in sulphur, the inference is, that the application of bones treated with sulphuric acid does mischief, by providing sulphur to feed the disease.

When phosphates were applied to the hay-crop, the increase was at the rate of twenty per cent., whether applied dissolved or undissolved, whether derived from the animal or mineral kingdom. This seems to prove that the low value put upon undissolved mineral phosphates has been arrived at too hurriedly and without due trial. It also shows that further experiments are needed to throw light on the manner of assimilation of plant-food, as well as its absorption by roots.

Last season, at Preston (Sussex), artificial manure, the phosphates of which were rendered soluble, produced fourteen tons seven hundredweight of Swedish turnips per acre at a cost for manure of five pounds. On the same ground, under the same conditions, with the same manure, but with *undissolved* phosphate—a mixture of bone-flour and coprolite—fourteen tons two hundredweight were produced at a cost for manure of two pounds seventeen shillings and ninepence. The difference in the crop was slight; in the cost of the manure, very considerable. When pure dissolved bones were employed, the results were only eleven tons four hundredweight, and the cost three pounds three shillings and ninepence; when undissolved coprolite and sulphate of lime, the result was twelve tons eight hundredweight, and the cost two pounds one shilling and ninepence. On this soil, nine tons fourteen hundredweight were produced without any manure. The difference over that weight must therefore be looked upon as increase.

In 1881, at Preston, a mixture of *ground* coprolite, bone-flour, and sulphate of lime, along with twelve and a half tons of farmyard manure per acre, produced seventeen tons five hundredweight of white turnips, the cost of the mineral matter being twenty-eight shillings and eight-

pence. When commercial *dissolved* bones, costing forty-five shillings, were substituted, the yield was only fourteen tons two hundredweight. When to the mineral *undissolved* manure, there were added potash and magnesia, twenty tons an acre were secured, at a cost of two pounds four shillings and elevenpence. As Mr Jamieson, says in his Report of the experiments: 'True economy in agriculture, however, is not to be attained by a simple lessening of expense, but by attaining the greatest production with the greatest profit. The use of the bone-flour and coprolite is but one step in this direction; another step was essayed in making the mixture "complete" by the addition of potash and magnesia.' And further on: 'Probably one of the reasons why dissolved manures have been able to maintain the position generally given to them, is that they give a flush of leaf and an appearance of healthy growth in the earlier stages of growth. Not unlikely, the same reason hinders the acceptance of the *undissolved* mineral phosphates; for, when used alone, the crop is always rather backward at first. When used along with steamed bone-flour, however, the early growth is accelerated without being hastened to an unhealthy extent, and the quality of the produce is generally better.'

Chemists are generally agreed that plants require seven different elements from the soil in order to enable them to make healthy growth. These elements are—phosphorus, potash, magnesia, lime, sulphur, iron, and nitrogen. Experiments have been repeatedly made to prove that these are essential to plant-growth. Others are often found, even in great quantity, such as silica, soda, chlorine, &c.; but as many plants have been grown to perfection without them, their presence is considered accidental, and not essential. At one of the stations in Sussex where experiments were conducted last year, namely, Hassocks Gate, the soil was particularly suitable for strictly scientific investigation, for it was a pure sand, containing hardly any traces of plant-food. On this soil, turnips, even when supplied with everything except phosphate, merely lived without increasing in bulk. When ground coprolite was applied in addition, the produce, even in this miserable soil, at once went up to twenty tons an acre!

When potash salts are used along with other matters to form artificial manures, the chloride is invariably chosen, because it is cheaper and more soluble than sulphate of potash. In America, and we believe in this country, chloride salts of any kind have been found to produce watery potatoes. At Hassocks Gate, the use of chloride of potash proved utterly destructive—it killed everything. After-experiments proved that in ordinary soil, containing black mould, the remains of decaying vegetation, it was perfectly harmless. This fact is worth noting by farmers whose land is very light and sandy. It was also found that mixing nitrate of soda with the salt rendered it harmless. Mr Jamieson considers that the plants use the nitric acid of the nitrate and the potash of the chloride, and that the soda left over from the nitrate combines with the chlorine left over from the chloride to form common salt, which is not injurious in small quantity, and is easily washed away by rain.

Apart from the question, whether it is more economical to use dissolved or undissolved phosphates for turnips, these experiments go to show that it is best to use artificial manures as auxiliaries rather than sole manures. The best results generally follow when half stableyard and half artificial manure is used. It is unnecessary to dwell on this, as it is only a confirmation of what intelligent farmers have observed.

At Easter Ardross, similar experiments were made, also proving the value of undissolved phosphates, but not so markedly as in Aberdeenshire and Sussex. At the same time, it ought to be added that at Easter Ardross it was as much a trial of the different forms of nitrogen as of dissolved and undissolved phosphates, and as no precautionary mixture—that is, everything else—was added, the results were hardly so trustworthy. However, it may interest our readers to know that when undissolved phosphates alone were applied, the increase in the crop was at the rate of seventy-eight and a half per cent. When dissolved phosphates were given, the increase was one hundred and forty-six per cent. And when an 'ammoniacal phosphate of magnesia' named 'fimur'—manufactured from the sewage of Birmingham—was applied in quantity sufficient to make the nitrogen combined with it equal to the nitrogen in the other plots, but with only half the phosphates, the increase was one hundred and sixty-six and a half per cent. When sufficient was given to make the phosphorus equal to that in the other plots, the increase was two hundred and thirteen and a half per cent., or twenty-six tons thirteen and a half hundredweight per acre. From different sources, we learn that this 'fimur' has produced extraordinary results in all kinds of field and garden crops, especially benefiting poor worn-out pastures. Agricultural chemists have hitherto paid more attention to phosphoric acid—as found in phosphates—potash, and nitrogen, than to the other necessary elements of plant-food; but the wonderful success of 'fimur' raises the question whether magnesia be not equally important. As we understand special investigations are being made this year in different quarters to ascertain the true value of magnesia, we will not in the meantime refer further to the question.

While scientific experiments in England and Scotland have proved that phosphates are particularly favourable to mangold-wurzels, turnips, and cereals, and that a proper use of undissolved phosphates is preferable to dissolved phosphates, because more economical; in Ireland, the value of potash salts for potatoes has been demonstrated. While open farmyard manure, applied at the rate of thirty tons per acre, gave thirteen tons fifteen hundredweight, and the same amount collected under cover gave sixteen tons thirteen hundredweight; two hundredweight of kainite (crude potash salts from mines in Germany) gave thirteen tons nineteen hundredweight, and four hundredweight gave fourteen tons six hundredweight. (Without any kind of manure, the yield was only five tons.) When, however, two hundredweight of kainite was mixed with an equal quantity of American phosphate, the resulting crop was in one instance as high as fifteen tons fifteen hundredweight; and with Curaçoa

phosphate, fifteen tons nineteen hundredweight. When Alta Vela phosphate was used, the result was fifteen tons. When bone superphosphate (the dearest phosphate) was used, the result was fourteen tons six hundredweight; and with mineral superphosphate, in one case thirteen tons nineteen hundredweight; and in another, fourteen tons two hundredweight. When phosphates alone were used, the crops were much smaller, the very largest being a little over nine tons, but the majority being much less. As the withholding of potash from turnips does not markedly lessen the produce, we can here see that potash salts have a peculiar influence on potatoes. Indeed, speaking broadly, potatoes demand potash; turnips, phosphates; and cereals, nitrogen. In no case in the Irish experiment did the addition of nitrogen in the form of sulphate of ammonia or nitrate of soda, increase the potato crop, but rather the reverse. This should be noted, because farmers are apt to look upon these as the artificial manures *par excellence*. In the case of turnips, the crop is apparently, but not really increased by their use. The gross weight may be, and is, increased; but the increase is only water, the dry weight being very seldom increased. This is an evil; for the firmer roots are, the better do they keep, and the less work there is in carrying and handling a given weight of a given amount of nourishment. Money thus spent is misspent—thrown away, and worse. When these manures are applied to cereals, however, the increase is real and substantial.

It has long been known that animal organisms are the agents whereby organic remains are quickly resolved into their component elements, and 'dust returned to dust.' Only lately, however, has it been discovered that germs have the power of changing such a semi-mineral substance as ammonia into nitric acid. That the chemical change did take place, was known; but under what condition and how, was mere guesswork. The discoveries of Schoelosing and Muntz on the continent, confirmed as they have been in this country by Messrs Lawes, Gilbert, and Warrington, leave no room to doubt that the work is done by those minute organisms termed bacteria.

The discovery is one of great importance to agriculturists and sanitarists alike. Briefly stated, it explodes the current belief that ammonia once fixed by the soil remains there till the roots search it out and utilise it. The fact proved is, that no sooner does ammonia become fixed in the soil, than the bacteria seize it, and, quicker or slower, according to the temperature, convert it into nitric acid, which, seizing on lime, potash, or other base, becomes a salt that is very easily, and indeed is, to a great extent, washed away and lost. This discovery should do much to prevent the waste of the most valuable constituent of manure—for ammonia is worth one hundred pounds per ton—and when its bearings are realised we shall find the preparation and application of manures carried out in a way very different from the present.

To sanitary authorities, the matter is no less interesting. Bacteria only exist in the presence of decaying organic matter; they swarm in all fertile surface soils; they are probably absent

from all subsoils and pure sands. To pass sewage through subsoil or sand—as is the usual way in sewage-farms—is merely to keep back matter in suspension, and allow soluble nitrogenous matter to pass into and pollute drains and streams. When—as has in some cases been done—deep filters are made of *surface* soil, this objectionable matter is got rid of by being converted into nitrate, which is unobjectionable. Moreover, filters so constructed require a small area as compared with sewage-farms, for now that the matter is better understood, *depth* may be made to take the place of width.

AN AMUSING EPISODE IN THE LIFE OF A POET.

PARNY the French poet, who enshrined in charming verse the graces of Eléonore, the woman he loved, is perhaps not much known to the English reader. He bore the title of Chevalier, afterwards Vicomte de Parny; and was a native of the Isle of Bourbon, where he was born in 1753. At the age of nine he was sent to France, with the view of entering the Church; but after a time he resolved to exchange the cassock for the sword. After completing his studies in the Military School, he returned to his native isle. He was then twenty years of age. Here he fell in love with a young Creole lady, whom he named Eléonore in his verse, but whose real name was Esther de Baif. Their mutual love inspired his first poetical effusions, which are graceful and sincere, though possessing a degree of warmth which, to English readers, may seem to savour somewhat of affectation. In France, however, his love-poems were received with the utmost enthusiasm; and when, in 1775, he published his first collection of elegiac verses, he was speedily spoken of by his numerous admirers as the French Tibullus. In the after-course of his life, he experienced various reverses of fortune, and died in Paris in 1814.

Parny, whose nature was timid and retiring, once met with an amusing adventure in Paris, which is worth relating. He was in the habit of buying his books of a certain M. Frocard, a learned and upright man, who took delight in procuring for Parny rare works of great authors which he met with at sales, charging the poet only the commission. His shop was small, his business somewhat injured by the Revolution. He had been forced to establish a secret warehouse in the Rue de Verneuil, where he kept rare volumes, and those works which were at that time prohibited. One day Parny came to him for a book which he urgently required.

'I haven't it here,' said Frocard; 'it is at the warehouse. If I were not alone, I would go and fetch it.'

'Go, pray,' said Parny; 'I will keep shop for you.' So saying, he seated himself on the counter, and began to write some verses of a new poem upon which he was at work. As he was in the very heat of composition, there entered one of those pretenders to learning, who, having picked up a little of the jargon of society, mingled with a few quotations, and a few well-prepared phrases, manage to hide their ignorance till they meet with a scholar. This person, seeing a pale, dried-

up-looking man, half bald, dressed in an old gray coat, in possession of the counter, naturally took him for the bookseller, and asked him in a perfectly assured tone of voice to let him see a copy of the Marotic poems. Parny felt bound to supply the place of M. Frocard, and not to permit him to lose a customer; so, searching for the works of Clement Marot, he handed them to the unknown buyer, who, opening the first volume, read a few lines.

'What does all this mean?' cried he. 'This is not what I want.'

'Did you not ask me for the Marotic poems?' asked Parny.

'Those are not the poems, my good fellow, nothing like them.'

'I do not know of any others.'

'I want the Marotic poems, those about Eléonore.'

'I only know of some by Parny,' said the poet, reddening and hesitating.

'Parny! That's the man—his Marotic poems.'

'Erotic, you mean, do you not?'

'Erotic, Marotic—well, they are much the same thing.'

'Yes; much the same,' said Parny, repressing a smile as he reckoned up his man.—'Here they are,' he added, handing him two elegant volumes, morocco bound and gilt-edged.

'The price?'

'Upon my word, I hardly know.'

'What! you don't know the price of your books?'

'The binding of these two little volumes may be worth more than the text; but I think they must be worth six francs.'

'You will allow me the discount to literary men?'

'No; I cannot, conscientiously,' said Parny significantly.

'Well, if you cannot, I suppose I must pay the full price;' and the unknown paid his money and left the shop, bestowing a patronising glance on the person, whom he little dreamed was the author of the charming poems he was carrying away, and from which he intended to cull the fresh beauties that would help him to shine, that should establish his pretension as a *bel esprit*.

In a few minutes, M. Frocard returned, carrying the book he had been seeking. Parny laughingly related the comical scene which had just taken place.

'And what did you ask for your books?'

'Six francs.'

'Not half their value!'

'What! two little vols in sixteenmo!'

'Vellum paper, illustrated initials, Courteval binding—twelve francs, I can tell you; the edition is exhausted, and it was my last copy.'

'Upon my word, I did not think my works'—

'You are the only person who does not know their value.'

'Listen, Frocard. You must not lose by my ignorance. My customer has so amused me, that I most willingly indemnify you for the loss I have caused you.'

'By no means, Monsieur de Parny.'

'Yes; I insist. I was your substitute. I ought to have understood my duty.'

As they were settling the matter, a carriage stopped before the door, and a lady entered—a lady as remarkable for her beauty as she was distinguished by her noble and graceful bearing. The calm succeeding the revolutionary tempest, had brought her to Paris. She addressed the bookseller as if she esteemed him; and he welcomed her with a respectful deference that announced a change of scene, and that this lady was as well informed as the would-be scholar was self-sufficient.

'My dear Monsieur Frocord,' said the lady, 'I want you to help me to repair a great loss that I have sustained in my travels. That rich chest which you transmitted to me so carefully, and which contained one hundred volumes of our finest poets, was, I suppose, badly fastened to the carriage, and has fallen off in the night. I have lost my best friends, my dearest travelling companions. I entreat you to renew this precious collection for me as soon as possible; and meanwhile give me the most precious among them, the works of the Chevalier de Parny.'

'I have not one copy, Madame; I have but a few minutes ago sold the last. I would, however, much rather see it in your hands than in those of the person who has bought it.'

'Well, then, pray get me another. It is my favourite book. I rank the author of *Eléonore* on a level with Ovid and Tibullus.'

'That is ranking him high, Madame,' ventured Parny with a smile, that seemed ironical and disdainful in the eyes of the fair unknown.

'You think so, sir?' said she coldly, taking him for one of those mediocre writers who too often are jealous of genius. 'I think you would find it difficult to name one of our poets, ancient or modern, who excels Parny in the purity and excellence of his style, his graceful softness and delicious *abandon*.'

'O women, women! The poet who sings of love has so much influence over your hearts.'

'Parny is doubtless dear to women; but he is equally dear to all who know how to appreciate true talent. His erotic poems are simply perfect; his elegies deeply touching. He is no servile imitator; his model is in his warm heart, his brilliant imagination. Like Tibullus, he is the poet of lovers; but less monotonous, more rich, more versatile. Like Catullus and Gallus, he is facile, ingenious, and often rises to the sublime. His *Dégagements de Vénus* rival those *Veillées* portrayed by Longus, with a charm, a touch that Parny alone can imitate.'

'Ah, Madame,' replied Parny, moved in spite of himself, 'I did not expect such an eager adversary. *Eléonore* herself, if she were here living, could not defend him more faithfully.'

'If I have convinced you, sir, of the merits of him who sings her charms, I shall congratulate myself on this interview; but if you persist in running him down, I warn you we shall quarrel every time we may chance to meet.'

'Such meetings, Madame, will have so much value in my eyes, that I should not wish to destroy their charm.'

'Your compliments will not change my opinion of Parny, whom I have never seen, and am dying to know. I consider him a scholar of the very first rank, an honour to the age. I declare that he has no living rival, and I pity

those who can neither understand nor appreciate him.' And so saying, the unknown beauty quitted the shop, casting on Parny a parting look, which showed him that she classed him with those wretched detractors whose business it is to deny the talent of their contemporaries, who attack reputations which are a torment to them, because they cannot hope to rise to such distinction.

'Who is this charming woman, who so warmly defends me against myself?' asked Parny of the bookseller, who was almost as much flattered as himself by this scene.

'It is the favourite pupil of Duclos and D'Alembert, a friend of letters, an ardent protectress of talent; delighting in surrounding herself with artists and literary men, honouring those already celebrated, helping them when they are struggling, assisting them with her countenance, her fortune. In a word, Monsieur, it is the Duchesse de R—.'

'Ah! I have often heard her name; but the idea I had formed of her, was nothing in comparison with the reality. What brilliant elocution! what fire in her eye! what irresistible grace! and what a perfect acquaintance with the elegiac poets!'

'It was the possession of all these charming qualities which made her capable of defending your charming productions. I tell you again, Monsieur de Parny, you are the only person who does not know their value.'

Our poet left his bookseller's, carrying with him the ineffaceable impression of this unforeseen rencontre.

Several months after, the re-organisation of the colleges took place under the titles of Primary Schools. Parny and another were appointed to the work. Professorships were eagerly sought. One day, among a crowd of applicants, a man presented himself whose pompous self-assured air was worthy a minister of state, or at least a member of the Institute. Being shown into the presence of Parny's colleague, he presented a petition requesting the post of Professor of Belles-lettres in the new establishment about to be founded. He was told that as the petitioner was quite unknown, it was indispensable that he should be recommended by some public functionary, who would attest his capacity.

'But I am my own referee,' said the petitioner. 'I thought true talent needed no other recommendation. I am astonished that you do not know me.—Parbleu!' cried he, as he perceived Parny, who just then entered, 'here is my bookseller, who will answer for me.'

'What!' cried Parny's colleague; 'Monsieur, your bookseller?'

'Yes,' replied Parny promptly, making a sign to the other; 'I had the honour, some time ago, to sell this gentleman the Marotic poems of Parny.'

'Erotic, my witty friend.'

'Erotic or Marotic—they are much the same thing,' replied the French Tibullus, with a grim smile.

At these words, the man seized his petition and disappeared without venturing on another word.

A few days after this occurrence, a lady entered

the office. She came to solicit a place for a well-known and highly respected Professor who wished to be established in Paris. She was told that the schools of the capital were under the direction of Monsieur de Parny.

'What!' cried she. 'Is Monsieur de Parny in the Office of Public Instruction? It is a post worthy of him. I rejoice in the chance which at last procures me the pleasure of knowing him.'

As she spoke, Monsieur de Parny appeared, dismissing several applicants. 'What!' cried he involuntarily, 'have I the pleasure of seeing the Duchesse de R——?'

'Who has come,' replied she, with a charming smile, 'to dispute with you again as to the works and genius of the Chevalier de Parny.'

'Ah, Madame,' said the poet, 'where shall I find weapons worthy of combating you? Now you know me, I have no longer the same advantage I had at my bookseller's. It is difficult to hear one's self praised by such lips, without modesty giving way to gratitude.' He then related to his colleague the scene which had passed in Frocard's shop.

The Duchess embellished the story with details in the most piquant manner. She obtained for her talented friend the place she solicited, and thenceforth felt for Parny an attachment and esteem that spread a grace and charm over his career, and contributed ultimately to open to him the doors of the Académie Française—a reward worthy of his genius.

THE GROWTH OF A PORT.

CARDIFF, now popularly termed the Metropolis of South Wales, is a striking instance of the rise and progress of a modern British port. Within living memory little better than a village, it now proudly vaunts itself our chief port in point of foreign coal shipments. One by one, other ports have been passed—even Newcastle itself lags behind in coal exportations to foreign countries—and the little Welsh place of two thousand inhabitants in 1801, has become a fine town of nearly ninety thousand inhabitants in 1882. The relative importance of Bristol is being continually lessened by this local growth of the nineteenth century, and there are not wanting those who boldly assert that Cardiff bids fair to become a second Liverpool. Of late years, too, there has been a more strenuous effort on the part of Cardiff merchants to secure an import traffic; and the development of this branch of trade is fraught with great good; for experience has taught most commercial men, that in the best colliery districts fluctuations will inevitably occur, chiefly from the disputes which unfortunately take place between employers and employed. The South Wales coal-field, whence Cardiff derives her vast coal-supplies, has not been exempt from disturbing influences; and in 1875 a prolonged strike and lock-out gave a most disastrous check to the tide of commercial prosperity. But a period of peace between the disputants has supervened, and the wages of the colliers are now amicably regulated by a Sliding Scale Committee, consisting of representatives of employers and workmen.

We have before us a book published in 1888, which states that Cardiff was a town upon the Taff, two miles from the sea. This brief description would have sufficed for a hundred years afterwards, as it was not until 1798 that the condition of the place underwent a change. In that year, the old Glamorganshire Canal from Merthyr to Cardiff—the proprietors of which still hold their meetings at the latter place—was opened, and its construction was due to the strong presumption that the black diamonds which lay in the adjacent hills and valleys demanded more adequate means of conveyance for shipment than that afforded by wagons and mules, which had hitherto brought the coal down to Cardiff in sacks. The canal was no doubt looked upon as a great enterprise, but it has since been dwarfed by other undertakings. The vessels that frequent the canal lock are necessarily of moderate capacity, and the canal itself as a means of conveyance has been superseded to a large extent by railways. But the promoters of this old auxiliary to Cardiff trade are deserving of remembrance, inasmuch as they were the first to assist the development of what is now the chief port in the Bristol Channel. Captain Smyth, R.N., writing in 1840, said: 'This port (Cardiff) was held to be in extreme activity half a century ago, when the comparatively scanty supply of iron was brought down from the hills in wagons, each bringing two tons, drawn by four horses, and attended by a man and a boy. Even Mr Bacon's contract guns in the American war were thus conveyed for embarkation to the side of *Gwlad Quay*. . . . Coals at the same time were brought chiefly from Caerphilly Mountain, in bags weighing from one hundred to one hundred and thirty pounds, on horses, mules, and asses, with a woman or lad driving two or three of them.'

Three years after the opening of the canal, the population of the town, which still occupied its old site near the Taff, was 1870. In 1839, the West Bute Dock, built at an immense outlay by the late Marquis of Bute, a great land and coal owner in the neighbourhood, was opened. This gave a great impetus to trade, the facilities of the port for coal shipments being very much increased by this sheet of water, which has an area of twenty and a half acres.

The railways that were now made played an important part in the development of the port, and very soon the docking accommodation already provided was rendered inadequate. It became necessary to build a new dock; and the completion in 1859 of the East Bute Dock, by the same noble proprietor, marks indeed an epoch in local history, a fact which will be at once understood when it is pointed out that whereas in 1851 the population was eighteen thousand, it had increased in 1861 to over thirty thousand. The area of the new dock was forty-five acres. In 1874 the total acreage of the Bute Docks had been brought up to seventy-seven and a half by the construction of the south basin. And now the port awaits the building by the present Marquis of Bute of another and a still larger dock.

The rapid growth of the port has called for the closest attention of the corporation to the general requirements of the town. Even in recent years, many central streets were narrow, and

partly blocked by ancient impediments. Improvements in these respects have been effected at great cost, and the town has undergone radical alteration. Several Improvement Acts have been obtained; but the most important was that which authorised the amalgamation in 1875 of Cardiff with its out-growths, Canton and Roath, and the expenditure of a very large sum of money in street-works. Whole blocks of houses have been pulled down, the Cardiff bridge has been widened, and other alterations of great utility brought about under the provisions of the Act. The inhabitants move with the times, and there is much public spirit in the amalgamated borough, which manifests itself in every direction, as the records of the daily press constantly show.

With regard to the shipping-trade, the position of Cardiff will perhaps be better understood when it is stated that the value of exports in 1880 was L.4,161,778; and the imports, L.2,338,133. In 1881, the coal exports amounted to 5,496,442 tons; iron exports to 124,591 tons; coke exports, 17,669 tons; patent fuel, 117,449 tons; coal coastwise, 933,500 tons. In 1845, 414,159 tons of coal were shipped coastwise, and 32,498 tons to foreign ports.

Cardiff may no longer be described simply as a Welsh town. The making of the docks was the means of attracting to it a large number of Irish labourers, who have permanently taken up their residence in the locality. English and Scotch capitalists help to swell the accessions, and many of the leading ship-owners and merchants are now of the 'north countree.' Yorkshire and Lancashire are well represented. But although the town is of a composite character, it must not be supposed that the Welsh element is eliminated. Far from it. There are many Welshmen who, individually, demonstrate considerable business capacity, and who conduct very large establishments in the town and at the docks.

About twenty years ago, it was stated in a local guide-book that 'the greater portion of the inhabitants are labourers and persons engaged in trade. A great many Irish have settled in the town, and herd together in the lanes and alleys, where abundance of filth is to be met with.' What we have already said shows that this description, as applied to the present state of the town and its inhabitants, would be misleading. As to the lanes and alleys, they are being gradually got rid of, or improved; and sanitary inspectors have assiduously looked after the dwellings where people have been suspected of 'herding' together. It is true there is yet need for improvement in some of the lower quarters of the town, but we are not aware that Cardiff is dirtier in this respect than some other large ports. But in this case, special allowance should perhaps be made for the rapidity with which the population has increased. As the shipping has outgrown dock accommodation, so has the demand for houses been greater than the supply. In the memorial of the Cardiff Corporation in favour of the establishment at Cardiff of the proposed University College for South Wales and Monmouthshire, it is mentioned that during the five years 1875-79, nearly one million pounds is believed to have been expended by speculative builders alone in the borough,

and it is a certain fact that Building Societies are doing an extensive business in the locality. During the six years ending August 31, 1881, one hundred and forty-five new streets had been constructed; three thousand eight hundred and twenty-nine new houses, and eleven places of worship, were built; new schools numbered twenty; shops, one hundred and sixty-one; other buildings, nine hundred and sixty-four: total new buildings, four thousand nine hundred and eighty-five. And yet there is scarcely an empty house to be met with, and many small tenements are occupied by two or more families.

The general aspect of the town is admirable. On all hands are to be seen business and residential premises of an elegant character. Churches and schools abound; and there is every indication of an earnest desire to provide as fully as possible for the moral and social necessities of the port. The town generally is not consolidated, in a topographical sense. Situated in the first place two miles from the sea, it has extended seawards. The docks prevented its direct extension to the south-east, and its northern suburbs have spread in an easterly and westerly direction, intervening spaces being occupied on the west by the river Taff, and in other parts by large spaces of land not available for building purposes.

Of the local landowners—chiefly the Marquis of Bute, Lord Windsor, Lord Tredegar, and Mrs Macintosh of Macintosh—it may be said that their policy is spirited; and their liberality has been evidenced in a number of important public gifts. Although Cardiff has grown so rapidly, it is felt that the town is yet in its infancy. With its rise and progress, the multiplication of collieries and iron-works—more especially the former—has been contemporaneous in the landward districts of the port; and as the supply of coal and iron is practically inexhaustible, it is not unreasonable to suppose that a great future is in store for the locality.

SOME TESTAMENTARY CURIOSITIES.

Of curious bequests, there would seem to be no end; indeed, any one bent upon making a complete collection of such singularities, has a hobby that will last a lifetime. For the newest specimen of eccentricity in this line we are beholden to Signor Pasquale Favelle, a well-to-do gentleman, 'late of Naples,' and still later of London, where his will was proved not very long since. By this document, the testator leaves three Italian municipalities four hundred and fifty pounds each, and the Corporation of London seven hundred and fifty pounds; the interest in each case to be given every year to three poor girls between the ages of sixteen and twenty-five, by way of marriage portion, the claims of the candidates to be decided by lot, not by favour. The Corporations concerned may save Signor Favelle's executors any trouble regarding these matrimonial premiums; but they have a more unthankful task in deciding where to place a legacy of two hundred and forty pounds bequeathed 'to the Editor enjoying the

greatest repute in any town of Europe; a legacy the selected one is likely emphatically to decline, since it is burdened with the obligation of printing and publishing the testator's French novel *Zuleite*, his four-act comedy *An English Election*, besides sundry poems, including one on the Final Judgment. Although a voluntary exile from his native land, and taking the last opportunity afforded him to proclaim that he died as he had lived, a hater of tyranny and corruption, the Signor had nothing in common with the Democracy, for it is to 'Her Imperial and Royal Majesty of India and of the United Kingdom of Great Britain,' that he bequeaths his most cherished production, a tragic opera entitled *Alzira*; trusting that Her Majesty will order it to be performed for the benefit of the poor of London.

We fear the Neapolitan's hope of achieving posthumous fame is as little likely to be fulfilled as that of Dr Borne, who has left all he possessed to the University of Lausanne; conditionally that the bequest be allowed to accumulate for a hundred years; at the end of which time it is to be expended in translating his *Maxims and Aphorisms* into every known language, and supplying every library in the world with a copy of that doubtless wonderful but utterly unknown literary masterpiece.

Senator Baker, of California, had a very bad opinion of married men. After expressing the hope that his mother had too much respect for his father's memory ever to marry again, he yet provides for that eventuality by directing the bequest he made her to be paid 'free and independent' of any husband she might take to herself. Fully alive to the difficulties attending the efforts of women to gain a livelihood, he left his sister Lulu sufficient to insure her the comforts of life 'beyond any peradventure;' and knowing the tyrannical and unmanly conduct of many husbands towards their wives, desired that what he left her should be her own absolutely. Fearing this proviso might not prove sufficiently protective, this provident brother added: 'Should my sister be at any time so unfortunate as to have a husband addicted to gambling, intoxicating liquors, or other vices, or be of lazy or spendthrift habits; then I direct that my executors, or the Court having control of my estate, shall personally or directly expend such money in paying the living expenses of my said sister Lulu, and the maintenance and education of any children she may have. I trust that no such necessity will arise; but unforeseen calamities overtake the best of wives who are so unfortunate as to be wedded to depraved and unmanly men, who forget their vows and their duty, becoming monsters and brutes, when they should be companions and protectors.'

The Californian displayed anxiety to protect his womankind from the wickedness of his own sex. A Maine farmer, a man after Sir Wilfrid Lawson's own heart, sought rather to protect his legatees from themselves. By the terms of his will, he decreed that such of his sons, grandchildren, 'born or yet unborn,' or great-grandchildren, who should be detected smoking or chewing tobacco, or drinking ardent spirits or alcohol, unless prescribed by a physician under oath, should, as he phrased it, 'be cut off from

their dower in my property for six months for the first offence, and one year for each subsequent offence; and for one year of total abstinence, his or their dowers to be restored.' By a codicil, the limitations and conditions regarding tobacco and alcohol were extended to 'gambling in the ordinary sense of the term, or betting money or other valuable consideration.'

Without going to any such length, a German named Bechtel provided against those coming after him indulging in his pet aversion, by excluding any of his male descendants from sharing in his estate so long as they persisted in wearing a moustache. Not such a reasonable provision as that made by a Mr Stokes, whereby any person named as a beneficiary under his will lost all claim upon his estate if he or she raised any contention respecting it in a court of law.

If testators can do pretty much as they please in disposing of their property, they have no such power as to the disposition of their remains. Dr Crittenden, a London physician, directed that within three days after his death, his body should be handed over to his dear friend Eliza Williams, to be dealt with in such a manner as he had set down in an authoritative letter to the said Eliza Williams; any expenses incurred by her in carrying out his instructions to be paid by his executors within three months after his decease. In the letter to his lady-friend, the Doctor expressed his desire that his body should be burned 'when dead,' by being placed over and surrounded by fagots of wood; the calcined bones and fragments to be collected together, and placed in a Wedgwood vase, which he had already given into her keeping; or if that were not large enough, in a vase, metallic or otherwise, but, as she was aware, he had a preference for earthenware.

Taking no heed of the Doctor's instructions, his executors buried him in Brompton Cemetery. Three months afterwards, the lady petitioned the Home Secretary for a license to exhume the body for cremation, or, if that could not legally be done, for burial in another place. Sir R. Cross refused to grant a license for the purpose of cremating the body, but gave permission for its removal to a churchyard in Wales. Having got possession of the body, Miss (or Mrs?) Williams conveyed it to Italy, where she had no difficulty in fulfilling her friend's cremation instructions. Her conscience satisfied in this respect, she sued the executors for her expenses. The Court, however, pronounced that a man could not dispose of his dead body by will, the executors being responsible for its proper burial; besides which, the body had been obtained by illegal and false representations; and the action was dismissed with costs.

In 1877, a man who died in Berlin, leaving behind him a fortune of thirty-four thousand marks, surprised all who knew him by devising that thirty-two thousand marks should go to the authorities of his native place, and that the remainder should be divided between nine relatives and a friend with whom he had quarrelled, the share of any one of the legatees becoming forfeited if he followed the testator to the grave. His relatives religiously obeyed the dead man's decree; but the estranged friend,

remembering old times, could not refrain from going quietly to the churchyard and paying his last respects to the deceased. By-and-by, a codicil came to light directing that if any one of the ten

tees under the will should be found regarding the last will, he was to receive the bulk of the money left to the testator's town; and thanks to the shrewd device, the man who thought more of his old friendship than his old friend's money, found himself comfortably provided for, for the rest of his life.

A strange freak was played by a citizen of Brooklyn who died and left seventy-one pair of trousers. In accordance with his will, these were sold by public auction, for the benefit of the poor of the parish, no purchaser of one pair being permitted to bid for another. This odd stipulation excited no suspicion at the sale; but some days afterwards, one of the buyers, on making a close examination of his purchase, came upon a small canvas bag sewn in the waistband; on opening which he discovered therein ten hundred-dollar notes. He spread the news of his find abroad, and set the remaining seventy trouser-buyers inquiring into things, the result being that each one of them found himself richer than he had been by a thousand dollars; as welcome a windfall as came to the widow of a miserly Rhode Island livery-stable keeper, who left her two hundred thousand dollars, after separating from her for indulging in the luxury of a silk dress.

Captain Hartmann, a retired officer, well known in Jamaica, and noted for his fondness for animals, was as brave a fellow as here and there one meets; but while he did not fear death, he was possessed with a great dread of being buried alive, and made sure of escaping premature interment, by ordering his body to be kept in an open coffin till the last moment possible, when his head was to be cut off by a surgeon, who was to be paid ten pounds for performing the operation. That he considered life itself a great blessing, was further shown by his appointing a person to look after his dogs, cats, and birds, and see they wanted for nothing; while for the many horses, mules, and asses calling him master, they were to be released from labour for evermore, and made free of his acres of grazing-ground as long as they lived. When the last of these animal legatees dies, and not until then, the estate is to be realised, and the proceeds handed over to the Society for the Prevention of Cruelty to Animals.

It will be some years before the Society enjoys the handsome bequest; but its patience is not likely to be as sorely tried as that of the heir of an old Canadian farmer who is bound to work the farm for his stepmother's advantage as long as she lives, and then commence paying the rent to the family—fifty dollars a year—until three thousand dollars have been so distributed amongst them, when the farm will become his own. He is now thirty years of age; his stepmother is a woman in the prime of life, and reckoned good for another forty years. After her death, it will take him sixty years to pay off the encumbrances on the farm, so that he may cheerfully calculate upon being its sole possessor when he has attained the patriarchal age of a hundred and thirty. So may it be!

THE LABOURER'S WIFE.

SHE took her trouble in her heart, and went,
One spring-time Sabbath evening, from her door,
Shadow it leaves in drooping folds,
Not spreading yet broad welcome to the sun;
And through the meadows, and the hawthorn lanes,
Whose fragrance yet was closed within the bud,
To the wide fields, rich with up-springing corn.
Beneath the hedges, thickly tangled, spread
Vivid spring verdure. In the budding copse,
Hedged by thick sloe-blossoms falling white like snow,
Ere the black stems were gemmed with emerald leaf,
The birds sang out their welcome to the spring.
The dappled greensward, with pale primrose tufts
Of gold enamelled, and the wind-flower's pearl,
Lured her aside a moment, and she stood
Beneath a budding oak, and heard the burst
Of rich bird-music, carolled loud to God,
The God who cares for sparrows, and who hears
The ravens when they call. She list'ning stood.

Not one of all the gracious influences
Of peaceful Nature given by God to soothe,
Could His child recognise, or knowingly
Receive into her heart. No poetry
Within her sad and labour-hardened soul
Welled up, as though a stone were rolled away,
In tender presence of the Beautiful.
She seeing, saw not; yet she was not dulled
By God-sent trouble, but by many years
Of this world's work, and this world's prose, until
The prose had eaten into her like rust.
Still, soothed unknowingly by glory of spring,
She took her trouble with her, and went on
Through one field more, where cowslips stood in groups
Like fairies routed, flocked together in fear,
And shining grass awayed in the evening air,
That gave soft breathing to the tremulous lark;
And reached the village, and the lowly door
Of the small village chapel. Entering in,
She heard the songs of Zion; and the heart
Of the poor drudging woman rose with these,
Winging its way to courts celestial, raised
In praise with angels, who for ever praise
And cast their golden crowns (as seemed to her)
Before the Throne, and wave wide golden wings,
And love the Lord, and love His labouring poor,
Although their own white robes shine like the sun.
They, following His command, through His dear cross,
Shall welcome yet to seats already named,
And known by them, the weary of the earth.
Ye songs of Zion, rise up higher, higher!
O trembling voice, O calm and trustful heart,
The Lord is with thee! sends His poetry,
Not through the door of Culture, but of Faith!
To Him sing praises, for He giveth light—
And that not only light to see to work,
But light to beautify: and freely gives!

The service over, and her trouble less
(God helping her to bear it), she arose,
And going from the chapel, saw rose-stains
Of glory from the setting sun, fall fair
On the rough whitewashed wall, poured through the panes
Of lattice windows flashing gems and gold;
And seeing, saw not knowingly, but saw
Instead of God's great sunset, pearly gates
Of heaven, and His heaven's golden floor;
Saw no material sun, yet saw that Sun
Which never setteth, the blest Sun which bears,
For each and all, kind healing in His wings.

THE WORK OF RIVERS.

THERE is no series of actions occurring in the physical world around us of greater importance in the eyes of the geologist than the work of rivers. The high value which science is led to place upon the action of running-water as a geological agent, is by no means difficult to understand. We require firstly to bear in mind that the geologist endeavours to explain the past history of the earth by an appeal to its existing condition. The present of the earth is, in his view, the key to its past. This is the underlying principle of every detail of modern geology; and it is this method of explaining the past by an appeal to the existing circumstances of the earth, that constitutes what is known in geology as 'uniformity.' The geologist thus assumes that the actions and operations of Nature have been of uniform character, and that when differences have existed between the earth's past and its present, they can be proved to be differences, not of kind, but merely of degree. Thus he maintains, and with every show of reason, that rivers have always acted in the past as they act now; that rain and the sea have worn and wasted the land in the æons of long ago, as they wear and waste it still; and that volcanic eruptions, earthquake-action, and the rise and sinking of land, have served to modify the earth's surface in the past, as they are certainly seen to alter the contour of the land to-day.

In the work of modifying the earth, rivers have always held a prominent place. The early geologists invariably assumed that rivers were powerful agents in producing change, although they did not credit them with their full power as disclosed by modern research. Even Job speaks of the 'waters wearing the stones,' and of the 'mountain being moved out of his place;' and the observation shows us that in patriarchal days, the power of running-water to 'erode,' or to eat out and wear away the earth's crust, was a recognised feature of physical history. But it has certainly been left for the modern

geologist to show the full capabilities of rivers to effect changes upon the earth's surface; and to note the part they play in that well-nigh universal action, named 'denudation.' This action, as the etymology of the word indicates, is one of 'laying bare' the surfaces of the earth. But it is likewise something more. The 'laying bare' of rock-surfaces is only the prelude to them being wasted and worn, and to their being carried off, slowly or the reverse, to the sea and to lakes, there to form the rocks and foundations of the future.

In this work of denudation, there are employed a large number of natural agencies, which act ceaselessly upon the world's substance. There is hardly a feature of the land—hill, valley, river-course, basin, cliff—which does not represent either the direct or indirect result of the process of denudation. In this work of 'wear and tear,' the sea, of course, plays an important part. The ceaseless action of the waves affects the coasts, occasionally in an alarming fashion, by sweeping away large tracts of valuable land. The atmosphere also is ever at work, denuding the land by the action of the oxygen and carbonic acid gas which it contains; whilst ice, frost, and snow exercise a powerful effect upon the earth, whether in loosening the soils by the action of frost, or in the shape of the glacier, slowly cutting and carving its way from the mountain-tops to the valley below.

To rivers, however, must be ascribed the chief part in this action of 'denudation,' which it must be borne in mind is hardly a phase of pure 'waste,' inasmuch as the matter worn away from the land is being re-formed into rocks in the quietude of the lake-beds and in the abysses of ocean. Geologists have made elaborate calculations of the amount of waste matter which various rivers wear and bring down from the lands through which they flow, to the sea which receives them. It is obvious that the power of any river, however, will depend upon a variety and combination of circumstances; and it is needful to take these into account in estimating

the river's work. For example, the river that has to operate upon soft material will naturally possess a more evident effect on the district through which it runs, than that which flows over a rocky course. And similarly, the river which has a steep and precipitous course, interspersed with waterfalls, must act more powerfully on the land than the winding and slow-flowing river, whose meanderings are in fact due to the lack of force to sweep obstacles away.

On the basis afforded by such considerations, calculations of a river's work may be made with some degree of certainty. Thus it has been estimated that the Mississippi reduces the level of the country through which it flows at the rate of one foot in six thousand years. Supposing that this rate of wear and tear could be made to extend over the whole surface of North America, the average height of which is seven hundred and forty-eight feet, the continent would be reduced to the level of the sea in four and a half millions of years. This latter period, which seems, humanly speaking, of well-nigh inconceivable duration, is, in geological eyes, a mere fraction of the estimated total duration of the earth itself. Various rivers are found to wear the land at a greater rate than others, according to the circumstances detailed above. In the case of the Po of Europe, for example, the wear and tear are nine times as great as in the case of the Danube; and in the Mississippi, the rate is only one-third of that exercised by the seething and tumultuous Rhone. The latter river, according to the best calculations, removes one foot of rock in one thousand five hundred and twenty-eight years; the same work being accomplished by the Ganges in two thousand three hundred and fifty-eight years; by the Po in seven hundred and twenty-nine years; by the Danube in six thousand eight hundred and forty-six years; and by the Nile in four thousand seven hundred and twenty-three years. At the above rate, the Ganges would remove the Asiatic continent in five millions of years; assuming the average height of the continent above sea-level to be two thousand two hundred and sixty-four feet. Similarly, Europe would be worn down by the Po to the water-level in less than a million of years, provided the whole continent were denuded as rapidly as the Po-valley is worn to-day.

Some highly interesting statistics have been given regarding the amount of water and of sediment of all kinds which various rivers bring down to the sea. In the Tay of Scotland, for instance, it is assumed that the area of drainage is two thousand five hundred square miles; the annual discharge of water being one hundred and forty-four billions of cubic feet; and the sediment amounting to nearly fifty millions of cubic feet per year. The Clyde is credited with bringing down nearly nine millions of cubic feet of sediment per annum; whilst the Forth, with a drainage area of four hundred and fifty square miles, is estimated to carry to the sea nearly five and a half millions of cubic feet. Our own British Islands are estimated to possess an average height above the sea of six hundred and fifty feet; and it has been calculated that as things are, our rivers will have worn our territory down to sea-level in about five and a quarter millions of

years. Sir Charles Lyell calculated that the amount of matter brought down by the Ganges in one year would 'raise a surface of two hundred and twenty-eight and a half square miles, or a square space, each side of which should measure fifteen miles, a height of one foot.' Another estimate gives the work of the Ganges as equal to the collection of an amount of matter which would exceed in weight and bulk forty-two of the great Pyramids of Egypt. To transport a mass of solid matter from the higher country of the Ganges to the sea, equal to that brought down by the river in the four months of the wet season, would require a fleet of over eighty ships, each carrying fourteen hundred tons; the whole fleet sailing 'down the river every hour of every day and night for four months continuously.' These calculations, based on data which cannot be questioned, serve to show the rapid rate at which the earth's surface is being worn down by the rivers of the world. And the action loses nothing of its significance when we reflect that the action of the merest brook does not differ in kind from that of the largest river. For brook and river alike run seawards or lakewards; each laden with matter from the land, and each in its own way serving to alter, modify, and reduce the land-surfaces to which it serves as a drain.

The influence of waterfalls, as serving to aid the wearing action of the river through the increased velocity of the water, has already been alluded to. The most notable example of the effects of running-water when associated with cascades, is found in the celebrated Falls of Niagara. These consist, as most readers know, of two cascades, having a small island (Goat Island) intervening, and presenting a total breadth of nine hundred and fifty yards. The height of the Falls is one hundred and forty and one hundred and sixty feet respectively. About six hundred and seventy thousand tons of water are shot over the verge of Niagara every minute. The river itself flows over a comparatively flat table-land, in the course of which Lake Erie forms a well-marked basin. Near the Falls, it rushes over an uneven and rocky bed of limestone, and exhibits a striking difference from its comparatively quiet and even upper course. Now it is a matter of common observation that every waterfall tends to cut its way backwards or towards the source of the river; and an examination of the Niagara Falls shows that the water after leaving the Falls passes through a comparatively narrow limestone gorge, extending to Queenstown, where this limestone overlooks a plain. Sir Charles Lyell calculated that Niagara wears away the limestone cliff over which it falls at the rate of one foot yearly; hence, as Queenstown lies some thirty-five thousand feet down the river, it may be assumed that it has taken that number of years for the Falls to cut their way backwards from their original position at Queenstown to their present site. Evidence is not wanting to show traces of river-action at a height of nearly three hundred feet above the present ravine in which the Niagara flows. Hence Sir Charles Lyell concluded that the river once ran between the present Falls and Queenstown at a height of some three hundred feet above its present level—that is, before the gorge was

excavated, and at a time when the Falls were situated at the latter place.

One of the most remarkable examples of river-action, both as regards the extent of the water's work and its uniformity, is found in the Rio Colorado of the Western American States. This area has been thoroughly and scientifically explored by the Survey of the United States Government, and the results of the examination testify anew to the power of running-water as an agent in modifying the earth's crust. In part of its course the Rio Colorado runs through rocky ravines of immense extent named 'cañons.' The Grand Cañon of the Colorado is in itself a magnificent spectacle. It is a chasm two hundred and seventeen miles in length, and with an average depth of one mile, or five thousand two hundred feet. This cañon cut through rocks, is only one amongst many through which the river finds its way, and at the bottom of which it appears to the observer above as a mere silver streak. What, let us ask, would have been the opinion of the geologists of former years, had the query been put to them concerning the means whereby these great gorges have been excavated? The answer would have borne that the river merely occupied the gorges which had been formed for it by some eruptive force. But an examination of the cañons shows this opinion to be untenable in the face of facts. Everywhere there are to be seen traces of the river-action on the sides of the cañons; at all points, the geologist is met by evidences of the plain fact that the river has actually eroded and worn out the gorges it has come to occupy.

Are there any circumstances in connection with the Rio Colorado River, it might be asked, which serve to explain the powerful nature of its action on the rocks? The answer to this question is of the most interesting kind, since it serves to illustrate a new circumstance in river-action, and one which renders it highly powerful in its effects on the earth's surface. The Colorado is undoubtedly a fierce torrent. Within the cañons it has a fall or slope of between seven and eight feet per mile, which is twenty times as great as that of the Ohio and Mississippi. But running-water alone will hardly accomplish a work of such magnitude as the Colorado has evidently been able to effect. Hence, when the geologist surveys the Colorado more closely, he notes that its work and power are largely due to the quantity of sand and like debris it carries down, and which borne along with its currents, serve like a natural saw or file, to wear and eat out the rocks over which it runs. The immense power of sand borne by running-water, as an agent in eroding rocks, is thus clearly demonstrated. But the sand must be present in proper quantity, that its work may be thoroughly accomplished. There must neither be too much nor too little sand in the river, if its work is to be thoroughly performed. Too much sand will block up its currents and impede its work, will lie in its bed, and will thus protect the rocks, instead of contributing to their wear. Too little sand will be swept onwards and leave no impression on the river-course. Hence, it is when the river, as is the case with the Colorado, possesses just that modicum of sand which it can keep moving with dire effect to the rocks, that the wear and tear proceed most quickly, and

that the work of water is seen at its best. Curiously enough, a tributary of the Colorado illustrates the case of a river which cannot erode its course because of the great amount of sand which it carries. This is the river Platte, which has a fall equal to that of the Colorado, but which is *overloaded* with sand. Hence its action on its course is feeble as compared with that of the Colorado, and its work can never, as things are, compare with that of its neighbour-stream, which has silently but effectually hewn out the land into the great gorges, which are amongst the most wonderful of Nature's gigantic works.

It is evident that rivers, entering lakes and seas, will deposit therein the debris and waste derived from the land. As has already been shown, this waste matter will be deposited as sediment, to form the rocks of the future; but when it is placed in lakes or in shallow waters anywhere, its effects are seen in the 'silt' or filling-up of lakes, and in the formation by rivers of tongues of land, which may jut out to sea for long distances. We know, for example, that the Rhone has formed new land in the Lake of Geneva, at the river-estuary, by the deposition of solid matter in the lake. An old town, called Port Vallais, which about eight hundred years ago was situated close by the borders of the lake, is now placed a mile and a half inland, through the river-deposits having come to intervene between it and the lake. So also the Italian Adria, which in the time of Augustus was a seaport—giving, in fact, the name to the Adriatic Sea—is now, says Lyell, 'about twenty Italian miles inland. Ravenna was also a seaport, and is now about four miles from the main sea.' But by far the most interesting case of the formation of river-land is that of the Mississippi. If we look at a map of North America, we shall be able to see the 'delta' of the Mississippi stretching seawards into the Gulf of Mexico, as a long tongue of land through which flows the river, and which allows the river to pass to the sea by three chief mouths. The South-west Pass is the broadest and deepest mouth; Pass à L'ouest points eastwards; and in the middle is the South Pass. This river brings down debris in a year sufficient to build a mass one mile square, and two hundred and sixty-eight feet thick. Each 'pass' has a 'bar' at its mouth, and the obstruction to traffic which once existed may be conceived, when it is mentioned that in 1859 fifty-five vessels were blocked at the South-west Pass, the freight of those bound outwards being seven million three hundred and sixty-seven thousand three hundred and thirty-nine pounds; whilst several had been waiting for weeks in the hope of getting to sea. It was little to be wondered at that the commerce of New Orleans was found to be seriously impeded by the state of matters at the mouth of the Mississippi. The advance of the tongue of land it may be mentioned takes place at the rate of about a hundred feet per annum at the South Pass; whereas at the South-west Pass, which latter is the chief entrance to the river, the river-sediment gains at the rate of three hundred feet yearly.

The problem how to keep one or more of the 'passes' open for traffic, so as to allow vessels to enter or leave the river at all states of the tide, has been solved by the ingenuity and enterprise of an American citizen, Captain James B. Eads,

whose name deserves to be handed down to posterity as a true benefactor of his own and other lands. Seizing upon the idea that the river keeps its own course clear so long as the rush of water, confined between banks, is great, Captain Eads resolved to simply extend the banks of the South Pass, so as to secure the requisite flow and force of water. After much opposition, Eads at length obtained government consent and permission in 1875 to carry out his scheme. He thereupon constructed a series of 'jetties' or extensions of the river-banks of the South Pass, by means of willow-frames, which were duly sunk in the river, and which the river itself filled and coated with sediment, thus rendering the whole structure solid. The work was completed on July 9, 1879, with the result that a new channel thirty feet deep, seven hundred feet wide at its surface, and two hundred feet wide at bottom, had been constructed. This channel is kept clear by the 'scour' of the river itself; the Mississippi has thus been rendered navigable at all states of the tide, and a great commercial success has been attained through a persevering study of the conditions wherewith Nature secures her own ends in the matter of river-action.

The study of rivers is thus seen to be fraught with instruction and interest, not only for the general reader, but for the student of the earth's structure and history. Many an interesting chapter in the world's history can be written by aid of the geological information supplied by the river and its work; and there can be no better introduction to geological science itself than a study of river-action, as a preliminary to the understanding of some of the changes which this world of ours is ever undergoing.

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

CHAPTER XXXV.—'COMES OVER HERE TO SEE CON, AND FINDS HIMSELF TOO LATE.'

CONSTANCE did not appear at the breakfast-table next morning; and Miss Lucretia, in answer to inquiries, shook her curls with a world of young-lady-like emphasis at Gerard, and declared that the poor darling was quite worn out by excitement, had passed a broken night, and was now happily asleep. Gerard was sheepishly discomfited by this intelligence, since he, in Miss Lucretia's eyes, was the evident source of mischief. The old lady sat but a little time at breakfast, and withdrew to keep watch and ward over the sleeper. To her surprise, the young lady was seated in her peignoir at a table, writing. She huddled away the paper guiltily on her aunt's entrance, and locked it in a writing-desk.

'You silly child,' said Aunt Lucretia with mild severity, 'you will spoil him if you write to him every half-hour when you cannot see him. Go to bed. You are quite flushed. You have had a bad night, and you must sleep. I shall bring my work here, and sit beside you until you do it. And I shall keep guard over you until you are fit to get up again.'

The lovely defaulter made no answer to this

rebuke, but crept into bed submissively, and after a time, feigned sleep. She was glad that her aunt suspected nothing. The note had not been intended for the accepted lover, but for Val Strange. To be compelled to stillness, to lie unbound, yet fettered by the eye of affectionate watchfulness, whilst the storm of feeling heaves the soul, and the soul strives to stir the body as the wind heaves the sea, to suffer the torments of anxiety, of remorse, of despised or unfruitful love, and yet to feign sleep and make no sign, is an agony added to an agony.

Miss Lucretia stuck to her post gallantly, and embroidered and watched with much combined industry and vigilance. She was of course without an idea of the restraint her presence inflicted, and in her kindly heart regarded herself as an unmixed blessing. Val in the meantime was settling down into the waters of despondency; but before absolutely surrendering himself for lost, he determined to make one more essay. So he wrote again; and this time, fearing and almost hoping that the last note might have miscarried, he gave the bearer definite instructions.

'You are sure you know Miss Jolly's maid, Richards?'

'Yes, sir,' said Richards. He was a romantic middle-aged person, a little given to drink in lonely hours, and much addicted to the perusal of imaginative literature of a certain type. He had been known to weep above his whisky-and-water and the woes of Lady Ella, in that tender romance 'Her Golden Hair,' in the *Boudoir Journal*; and he was beginning in his ridiculous old head to make romances for his employer, and was interested in the intrigue. 'I seen the young person once before at Miss Jolly's in town—the helder Miss Jolly, sir.'

'Very well,' returned his master. 'Take that note, and give it to the maid. Ask her to give it to Miss Jolly when she is alone—not the elder Miss Jolly, mind.'

'Certainly not, sir,' said the observant Richards. Val, who found the clandestine business oppressive, could almost have kicked the body-servant for his ready appreciation of the condition of affairs. Don Giovanni seems to have had no compunctions about taking Leporello into consultation; and all Vanbrugh's dashing young gentlemen are at home in the confidence of their valets; but Val was a gentleman of nicer notions, and found no pleasure in imparting the secrets of his soul to Mr Richards. He glared angrily, therefore, at that sympathetic menial, and briefly bidding him do as he was told, turned his back upon him. It is an old-world story that when the master marries the mistress, the man weds the maid, and Mr Richards had lived until his time had come. Miss Lucretia's maid, now devoted chiefly to Constance's service, was a bright little brunette, with a pretty figure and a neat foot, a peachy cheek and sparkling eyes; and she wore that modest and becoming dress of female servitude which ladies might copy with advantage to their looks. If the thick-set hazel were dying from Richards's topmost head, and the hateful crow had already trodden the corners of his eyes, he had still a heart, and he was still a bachelor. He had saved a little money. He knew of a public-house, a really respectable concern, in

which, as landlord, it might be pleasant to settle down to the *otium cum dignitate*. The respectable concern would want a landlady to brighten it; and why—cried Richards's heart aloud within him—should this charming little creature not be rescued from the restraints of a servant's life? So Richards, bent on his master's prosperity, did also a little love-making on his own account. In short, like a good servant, he identified himself with his master's cause. But inexorable Fate makes no allowance for good intentions if you steer your barque on the rocks, and the valet's shipwreck involved the master's. Of all delusive coquettes, Fortune is the most delusive and the most coquettish, and she must needs at once throw little Selina in the way of romantic Richards. Now, it stood to reason that if Richards at once intrusted his master's note to the maiden's care, he would have less chance of prosecuting his own suit than if he delayed the delivery a little while.

'Good-morning, miss,' said Richards.

'Good-morning,' replied Selina; and since Richards occupied the greater part of the way, she stood still. Richards, like other people, began to find the art of conversation more difficult than he had fancied it. But it seemed altogether safe and politic to say that it was beautiful weather for the time of year. Selina agreed to that proposition amiably enough, but evinced a discouraging desire to get by and go about her business.

'You haven't been long in Paris, have you?' asked the middle-aged valet.

'Longer than you have, if it's the school of politeness they say it is,' answered the maid. 'You needn't take up the 'ole of the corridor.'

'I shouldn't ha' stopped you, my dear,' pleaded Mr Richards, 'only I'd got somethink important to say.'

'Well, say it then,' responded the damsel pertly. 'My dear, indeed!'

In oratory, the best of all rules is to have something important to say, and to say it. But Richards was not an orator, and the appeal took him somewhat at a disadvantage. 'Very good orators, when they are out, will spit,' said Rosalind; 'but for lovers, lacking matter, the cleanliest shift is to kiss.' Mr Richards had never studied Shakspeare; but he followed his recipe, or strove to follow it. But as, with the slow grace of middle age, he essayed to circle the jump and taper form before him—with insinuating air, bent downwards, and had almost won his purpose, swift and sudden, the damsel slapped his face, first on one side and then on the other, and bounding past him, rapidly traversed the corridor and disappeared. The discomfited Richards prowled about in vain for a second sight of the scornful beauty. Little Selina might have resented his advances in any case; but it is within the narrator's knowledge that a gentleman out of livery, who resided, when his master was in town, in Chesterfield Street, had saved a little money, and knew a public-house, and was of opinion that Selina would make a capital landlady. The Chesterfield Street gentleman had breathed his moving story in the maiden's ear. Selina was 'engaged.'

So Val's second note miscarried; and Richards, being interrogated, made false declaration con-

cerning it, and said it was delivered; hoping, like others who have failed, to make failure good before he could be detected. All that day, the wretched valet pervaded the corridor, with the note lying on his conscience like a weight, and once meeting Selina, implored her to stay but for a moment. But she, with head in air, went by; and he, like the parent in Mr Campbell's poem, 'was left lamenting.' Then the miserable man, being a person of no resources, burned Val's letter, and wrote by that evening's post in application for a vacant 'place,' and so prepared to escape the day of reckoning. He was the readier to do this that he was a bad sailor, and had been compelled to live at sea so much of late, that the possession of a stomach had become a burden to him.

No response to Val's second appeal. She scorned him, then? Had he not deserved to be scorned? She had told him that she did not care for him; and he, in his vanity, had believed, in spite of her protestations, that she loved him. Well—he was rightly served. So the cold fit followed the hot, and in due time again the hot fit followed the cold. He had been so desirous of escaping Gerard hitherto, that he had remained almost a prisoner; but now, growing reckless, he wandered uneasily about the building, and suddenly encountered Reginald. He professed great preoccupation of manner, hoping to go by unnoticed; but being hailed, he turned, and with well-acted surprise, cried: 'Hillo! What brings you in Paris?'

'Oh, we're all here,' returned Reginald, linking his arm in Val's. 'I heard from Lumby that you had come back again. What an extraordinary chance by which you found those papers, wasn't it?'

'Yes, it was curious,' said Val, striving after a casual air—'very curious.—And so you're all here, are you? How's the governor?'

'Oh, as usual,' said the little man, with unfilial carelessness.

'And your sister?'

'Pretty well,' was the answer. Reginald made no account of female headaches.

'You spoke of Gerard just now,' said Val. 'Is he here?'

'Of course,' the little man responded—'of course. Directly you gave him the papers, he came racing over here. When that fellow Garling bolted and the smash came, the first thing Gerard did was to go to Constance and tell her about it, leaving her to cry-off. She has been a good deal cut up, and of course they've made it up again.—Seen Chaumont in *Toto-chaz-Tata*?—No? It's the best thing here.' Reginald, like the rest, had been misled by his sister. He had indeed had some clue to the maze in which she walked, but he had lost it. Her second acceptance of Gerard was unforced and spontaneous, and he supposed she was pleasing herself, and that Valentine Strange had been vain enough to deceive himself. But though he could not understand his sister, the little man was keen enough to make out his companion's condition. 'Will you come to see Chaumont to-night?' he asked.

'No,' said Val hurriedly; 'I am engaged. I must be off at once. How long do you stay here?'

'We leave to-morrow morning,' said Reginald.

'We should have gone back to-day, but for Gerard's coming.'

'Remember me to all of them,' said Val lightly. 'I must be off. Good-bye, old man. I shall see you in town shortly, I daresay.' He shook hands with nervous haste, and ran rapidly downstairs. The little man, drumming with his fingers on the top of his hat, looked after him thoughtfully.

'Didn't want to see me,' he mused. 'Walking languidly and apparently without a purpose, when I met him, and in a dreadful hurry now. M-m-m. Hasn't got over it yet. Comes over here to see Con, and finds himself too late. I'm very sorry for him, poor beggar; but if ever I am taken like that, if ever I fall in love, I'll try to hide the symptoms; and if the young woman doesn't want me, I'll try my hardest not to want the young woman.'

Val's persistence in a cause so evidently lost seemed a little disgraceful and unmanly, and even to Val himself it wore that complexion at times. The matter appeared to be growing hopeless enough now, and it seemed that Constance had resolved to hold no communication with him. If she were so resolved, Val was not yet so far gone that he could not see his way to the final cure of love. It was his belief that she had cared for him, which had so dangerously drawn him on all along; and he felt now that if he could but convince himself that he had been mistaken, he could go away and take his punishment like a man. But if he could, he would have a last glimpse of her before going for ever into the desert. So he went to see *Toto-chaz-Tata*, and sitting in a dusky corner of the house, he watched for Constance. Had he looked to the stage and listened, he might have found a reason for her absence; but anyhow she did not come, and the fascinating Chaumont tripped and smiled and warbled, and Val heard nothing and saw nothing but misery and stupidity. Paris laughed and applauded. Val for once thought the Parisian judgment nothing worth. Reginald was there alone, with no eyes for anything but the stage, and Strange got away unnoticed. He saw Mr Jolly and his party leave the hotel next morning, and, himself unseen, watched Gerard and Constance as they drove away. In the evening, he disconsolately followed, and arriving in London, learned that they had all gone down to the Grange. Well, he would go to Brierham, and there might meet with her. Let him only learn that she was happy, and he would be content. The unsophisticated credulity of the human conscience is a thing to wonder at. All life long a man may lie to it, and it will believe him in spite of countless detections. Val's new fraud was harmless and natural enough. So much may be admitted.

In the course of their journey to London, Gerard and Reginald had a talk which resulted in a movement important to this story.

'Do you remember the first night we met?' asked Gerard.

'Yes,' said Reginald. 'It was at Val Strange's.' He half sighed 'Poor Val' under his breath; but Gerard, who had ears like a fox, overheard the exclamation.

'Why poor Val?' asked unsuspecting Gerard. 'What's the matter with him?'

'That's his secret,' said the little man—'not

mine. I don't think he's happy.—I didn't mean to interrupt you. What about the first time we met?'

'Do you remember a visitor that evening?'

'No.—Ah, yes. The Yankee fellow, who threw back Val's money, because Val supposed that he might have peeped into your letter.'

'That's the man,' said Gerard. 'Do you know, I shrewdly suspect that Yankee to be one of the finest fellows alive?' And Gerard, with much enthusiasm and some humour, told the story of Hiram's clandestine benefactions. With the honest fervour natural to youth, Reginald declared that Hiram was a brick, and protested loudly that something should be done to reward gratitude.

'I don't think it's a common virtue,' said Reginald; 'and where you find it, I think the soil is likely to be generally good.' And indeed there are few of the virtues which are less inclined to be solitary. The two agreed to take advantage of their passage through London to call upon Hiram. They had but a few hours to spare; but not being hindered by other business, they drove Strandwards, and alighted at the restaurant. When they entered, Hiram was deftly distributing a pile of plates before a tableful of hungry guests. He recognised Gerard at once, and bowed to him with the waiter's gesture of welcome, and having disposed of the hungry tableful, hurried to the new arrivals.

'Good-day, sir,' he said to Gerard.—'Good-day to you also, mister. I had the pleasure of seein' you, sir, I remember, when Mr Lumby sent me on a message to Valentine Strange, Esquire. You was in the billiard-room in that gentleman's mansion.—What shall I have the pleasure of bringin' you, gentlemen?' They had not eaten a meal since leaving Paris, ten hours before, and they were each ready for a beefsteak. Hiram bustled about and brought up the steaks in prime order, tender and juicy, flanked by floury potatoes, crisp little loaves, and the foaming tankard.

'And now,' said Gerard, 'when you can spare a moment, I want to speak to you.' In a little while, Hiram found a lull in the demand for edibles and potables, and presented himself before the friends. 'What sort of a berth have you here?'

'Wall, sir,' returned Hiram, with the tone of a man who declines to commit himself, 'it's the bridge that's kerryin' me over a strip of time's tide, and I haven't got anything to say agen it.'

'Nor much for it, eh?' said Reginald.

'Yes, sir,' returned Hiram; 'lots for it. But it ain't the sort of theme to stimulate eloquence, and that's a fact. It's greasier than I like, for one thing.'

'Would you care to change it?' asked Gerard.

'Well, mister,' responded the cautious Hiram, 'that depends. I don't want to leap out o' the fryin'-pan into the streets.'

'Would you like to take service?'

'And go about in a pea-green vest, and have my head floured?' inquired Hiram with decision. 'No, sir; I should not.' He looked a little offended at the suggestion.

'No; thank you,' said Gerard; 'I don't want a flunkey. If I offer you a post, I shall not ask you to have your head floured. But I want a smart faithful man, whom I can trust; a handy

fellow, who has no objection to travel, and who won't object to do what he's asked to do.'

'Well, sir,' returned Hiram, 'if you're shootin' my way, it's a bull's-eye. I'm all that. But what should I be asked to do?'

'I want a man to attend me personally, to travel with me when I travel, and to act generally as a sort of combination of valet and confidential man. I shall offer you a liberal salary; and if you treat me well, I shall treat you well.'

'Very good,' said Hiram. 'I'm engaged. But if you don't mind, I'll make a stipulation—two stipulations. Number one: If I don't like the berth when I've tried it, I'm not to be regarded as ongrateful if I throw it up.'

'Certainly not,' interjected Gerard.

'And number two,' continued Hiram: 'That my own private proceedin's air not curtailed, so long as they don't interfere with my duties.'

'What private proceedings?' inquired Gerard, with some misgiving.

'Wall,' said Hiram slowly, looking from one to the other and stooping to fold a napkin on the table, 'the Apostle Paul says matrimony's honourable. As soon as ever I can manage it—I've got a little gell to take care of, and I'm going to take that way with her. And if you give me a berth that lets me marry, I shall do it.'

'Oh!' said Reginald, seeing Gerard a little dashed by this intimation. 'And who's the lady?'

Hiram straightened himself and looked at the little man keenly, insomuch that Reginald felt embarrassed, and took refuge behind his eyeglass. 'Yes,' said Hiram, as if in answer to an inward inquiry, 'I'll answer that question.—The lady is the daughter of a bitter enemy of your family's, Mr Lumby. Her father is— Well, mister, the long and short of it is, her father's about the biggest thief unhung. His name's Garling.'—At this the two friends glared at him and at each other.—'That is so, gentlemen,' said Hiram with great gravity. 'I know something about it, and part of it I guess. Mr Garling married under a false name, and deserted his wife and daughter, when my little gell was a baby.' And in answer to Gerard's amazed inquiries, he told briefly all he knew of Garling, detailing with the rest the scene in the offices of the great firm.

'I think it possible that I may owe you something,' said Gerard enigmatically, when Hiram's narration was closed. The date of Hiram's interview with Garling was that of the elder Lumby's last visit to town. Gerard more than half-guessed the truth. 'I must leave you to arrange your own domestic affairs,' he said after a pause. 'I shall not interfere with them. And now—as a matter of form—though I could scarcely forego it, I must ask to see your employer, and make some inquiries about you.'

'That's only fair to me,' said Hiram drily; and retiring, sent up the master of the restaurant. Gerard made his inquiries.

'Well, gentlemen,' said the restaurateur, 'I should be very unwilling to give him a recommendation.'

'May I ask why?' demanded Gerard.

'Because,' returned Hiram's employer, with

a twinkle of his beady foreign eyes, 'he is the best servant I ever had, and I should be sorry to lose him.'

The two friends laughed at this; and the restaurateur, pleased at the success of his little jest, laughed also.

'He is honest?' said Gerard.

'As I have found him,' said his employer, 'as the day.'

'Sober?'

'Remarkably. He is good fellow,' declared the restaurateur, returning to his joke; 'and I am sorry to say it, if it is to lose me my Hiram Search.'

'You don't object to his bettering his position?' asked Gerard.

'No, sir,' the foreigner answered heartily. 'He is good fellow. He will get on.'

On the strength of this, Hiram was recalled, preliminaries were completed; and the waiter formally gave his employer a week's notice. It was agreed that he should present himself at Lumby Hall in complete readiness to enter upon his duties.

'You will have a good servant, sir,' said the little foreigner.

'And I shall have a good master,' said Hiram.

'I thought you had no masters,' said Gerard, 'you Americans?'

'If you call beef mutton, it don't alter the flavour much,' responded Hiram; 'and when I'm in a country, I reckon to try to speak the language.'

'Oh,' said Gerard, 'and how many languages do you speak?'

'I shan't take the cheer for languages at nary one of your universities yet awhile,' returned Hiram; 'but I've spent five years in the Lee-vant, and I've picked up a bit o' five or six—French, Italian, Spanish, Greek, German, and a smatterin' of Turkish. I can talk any one of 'em fit to be smiled at; but I can't read one, wuss luck.'

'Gerard,' said Reginald when the two were outside, 'it's my opinion that Mr Search is a jewel.'

'I think so too,' said Gerard; 'but we shall see.'

The week sped by rapidly; and Hiram at the appointed hour appeared at Lumby Hall. In less than a week after the date of his appearance, the cook and the upper-housemaid, who were both comely young women, and had hitherto been close companions, quarrelled over him. 'Ladies,' said Hiram, having observed this, and desiring to live at peace, 'I feel myself kind of shaking down in this charmin' society of yours. After a rovin' life, how sweet is do-mestic felicity! The view of the feminine character which you have afforded me sence I first entered the present abode of bliss, has sort of crystallised the notions of matrimony which up to that time were floatin' in my soul. I'll ask you to excuse the poetry; but that's the fact. And in consequence of the impression prodooced upon my mind by you two charmin' angels, I am goin' to get married.'

'Indeed, Mr Search,' said the upper-housemaid. She was a courageous woman, and bore the blow steadily. The cook was *hors de combat*. 'May we hask,' said the upper-housemaid, 'who is the 'appy bride?'

'The happy bride, as you air so flatterin' as to

call her,' returned Hiram, 'will next week assume a position in the household of Mr Jolly.'

This was true. Hiram had already interested Gerard in his sweetheart's fortunes, and little Mary was elected as Constance's maid.

DR SALVIATI'S GLASS-WORKS.

THE last of the grand palaces having been built, and the Republic of Venice having touched the zenith of her glory and greatness, she thenceforth began to decline. The arts and art-industries for which she had hitherto been famous, shared her fall, and gradually sank into decay; while the old masters of Venetian mosaic, whose works survive to this day, finding that the world had no longer any work for them, died out and became extinct. Nor was this all; for their secrets died with them, and the art of mixing and colouring glass after the manner of the old masters was entirely lost to their posterity.

The glass-blowers of the neighbouring island of Murano did not fare much better than those of Venice; for their once extensive workshops dwindled down into a few poor huts, and that which had once ranked as an art, sank down into a common handicraft, dragging out a miserable existence; while the glass-makers of England and Bohemia easily drove them from the market even in their own land.

It was when things were at this very low ebb, that Dr Salviati, a native of Vicenza, who had studied the law in Padua, and had had a good practice in Venice for twenty years, chanced one day to come across 'George Sand's' novel, *Les Maîtres Mosaïstes*, in which she describes the brilliant period of the Venetian picture-mosaics.

It is well known that the five domes of St Mark's were once adorned inside with glorious pictures in glass-mosaic on a gold ground. The pictures themselves were well-nigh indestructible; but, most unfortunately, the building which contained them rested on a very unstable foundation; the vaulted domes were the first to sink, and parts of the mosaic cracked and fell out. There had already been some talk of repairing these pictures; but no one was bold enough to make the attempt; and in 1859 fresh lamentations were raised over the continued decay of such valuable works of art. It was just at this time that Dr Salviati's interest had been awakened in the subject; and being firmly convinced that the art-genius is hereditary, he first looked through the 'golden books' of the old Republic, in which the names of the best masters were formerly entered, and then made inquiries in Venice and Murano, where at length he had the pleasure of discovering certain descendants of the two famous families of Radi and Bonvico, who were still connected with glass-making. They were induced to join Dr Salviati; and a series of experiments was instituted with the object of re-discovering the old lost secret of colouring and mixing; the result being that one is now simply amazed at

the number of tints in use. The seven colours of the rainbow are now subdivided into twenty-two thousand shades, of which two hundred are flesh-tints alone. The lawyer spared no pains to accomplish his purpose; and in one way a layman has an advantage over others, for he is not fettered by traditions, and is ready without prejudice to take up what is new and original, as the history of discoveries very generally shows.

The gold paste which almost always formed the background of the old mosaics, was said by technical workmen to be especially difficult to imitate; but the Doctor solved the enigma in a very simple manner by placing a very thin plate of gold on a sheet of glass, covering it with a thinner sheet of the same, and then fusing the three together. This process has not been found to answer with silver, and the silver paste, so far as we are aware, has yet to be discovered. A few years after the work had been taken in hand, the Academy of Fine Arts in Venice announced that Dr Salviati's colours equalled and in some instances even surpassed those of the ancients, while he had doubled the number of tints. The raw material was therefore now ready; but unexpected difficulties arose as to the method of using it. The old masters worked from cartoons, which they copied bit by bit, putting each cube of glass at once into its place in the wall; but they were not mere servile copyists; quite the contrary; they were real artists, the only difference being that they painted with glass instead of with the brush. Men such as these with their skill and experience, as well as their ability, were not to be conjured up out of the ground even in Italy, where art is said to be indigenous; but necessity is ever the mother of invention, and Dr Salviati contrived a method of producing the mosaic pictures, which has an immense advantage over the old one, and insures the most faithful reproduction of the original design, as the work does not need to be done on the spot or on an unsteady scaffolding, as was previously the case; and it is no longer necessary for the copyist to be an almost greater artist than he who makes the design. As only technical skill is required, the work can be done at a much cheaper rate, and may be more extensively employed.

The modern mosaic-worker lays his cartoon or working-drawing on a table, face upwards. By means of a sharp hammer and anvil, he divides his pancakes of coloured glass into small dice, measuring a centimètre—a little over one-third of an inch—each way, and then places them on the picture, matching each tint and shade with the utmost exactness. When the design is entirely covered, he pours over it a fine cement, which penetrates every crack, and unites the whole into one solid mass. It is then placed in a shallow zinc tray; the design is washed off, and the picture appears, a true copy of the original, but with greater warmth of colour. The effect is so life-like and artistic, as Herr Gampe says, and the

work is of such a lasting nature, that its value was soon generally recognised. Scarcely twenty years have passed since the revival of the art, and already specimens of Salviati's glass mosaics are to be seen throughout the civilised world; for example, in the new Opera-house in Paris; Parliament Buildings, Washington; Kensington Museum; Windsor Chapel; the Cathedrals of Aix-la-Chapelle and Torcello; the Rotunda of the Vienna Universal Exhibition, &c.; to say nothing of the private mansions and palaces which may be seen thus adorned throughout Europe, in Cairo and Alexandria, and even in the giant cities of the West.

The astonishing success which had attended his efforts, induced Salviati in 1862 to consider the possibility of reviving the glass-manufacture of Murano, which had fallen into a state of such dismal decay; and to this end he ransacked old churches, castles, and museums, to find some of the ancient Venetian models; his idea being that the first thing necessary was to accustom the eye of the glass-blower once more to beauty of form, and that then his artistic skill and feeling would revive spontaneously. It was quite certain that glass itself had not altered during the lapse of centuries, and was just as ductile, just as plastic in its red-hot state, as ever it had been in the days of the Doges. And here let it be noted that glass-making in Venice is a very different thing from glass-making in England and Bohemia. *Glass-cutting*, which is so extensively practised in both these countries, is quite unknown in Murano, as are also painting and gilding. The Venetian glass-blower models his article entirely while the glass is in a state of fusion, and has nothing more to do with it when it has cooled. He never puts the colour on afterwards, but mixes it in the liquid paste; and he has to complete the most elaborate articles in a few minutes—every second being valuable, as the glass would become brittle if allowed to cool rapidly, and if kept too long out of the annealing oven. It is therefore essential that the eye and hand of the workman be trained to the utmost precision; for though he may find no great difficulty in making a dozen wine-glasses of exactly the same height and size, with nothing but his eye to guide him, it requires a very high degree of skill as well as artistic feeling to enable him to bring out all the delicate lines and curves equally, considering the rapidity with which he is obliged to work.

The Bohemians and the English, again, make their crystal glass of very decided colours, such as the Venetian glass could not stand, its paper-like delicacy and elegance requiring much more aerial tints, if form and colour are to be harmonised as they should be. Every furnace in Murano is accordingly surrounded by a regular laboratory, where the æsthetics of colour are carried to such a wonderful degree of perfection, that a visit to Dr Salviati's extensive premises in the Palazzo Swift sends one home amazed at the beauty and variety of the flower-like tints employed. All is brilliant, but nothing is glaring, and even the ruby-glass, which owes its peculiar brilliancy to an admixture of gold, shimmers with subdued radiance. Endless experiments have been necessary before certain shades of colour could be obtained, and there has been considerable diffi-

culty in reproducing among others the opal glass of the old Venetians, which has no value at all unless it has a tinge or rather *suspicion* of red playing through it. The play of light, which is often surprisingly beautiful, depends in great measure upon the thickness of the glass, which requires the most careful regulation.

With regard to form, it must be admitted that Salviati sometimes overshoots his mark; there is a certain hyper-delicacy about some of his drinking-glasses, which look not merely fragile but weak, and one feels uncomfortable in the presence of such super-sensitive articles. Some of the showy glass chandeliers, too, are as much overloaded with leaves, flowers, and ornamentation as a German inn on a fête-day.

Another highly decorated article, which must disturb the peace of mind of its owner, is the Venetian mirror, which is actually made in Belgium, and only sent to Murano to be adorned with its wreath of flowers. It is impossible to help thinking of the unfortunate housemaid whose duty it will be to keep it clean, and one foresees that some fine day her duster will catch in the prickly leaves and blossoms, and then down the whole thing will go with a crash.

It is hardly possible to describe the process of modelling, any more than that of painting and carving. The visitor sees a workman dip his blowpipe into the molten glass, and take thence a shapeless lump, which a few dexterous touches and a little breath convert into an exquisite little sea-horse, a vase, or a filigree glass, which looks exactly as if it had been woven; but how all this is done he cannot say, for it looks like the result of magic. Larger articles require re-heating, and this has to be done with extreme caution, lest their shape should be spoilt.

We may mention by the way, that most of the precious and semi-precious stones are imitated at Murano, and are bought by the Arab merchants, who sell them to the negroes. A handful of common glass mixed with certain earths and colours will produce what are to all appearance splendid specimens of agate and malachite.

But to return to Dr Salviati. The most difficult part of his enterprise has been, not the re-discovery of the secrets of the old masters, but the prosaic business matters inevitably connected with the establishment of his young art-industry. There is nothing of the tradesman about him; if there had been, if he had begun by calculating his chances of success from a commercial point of view, he would probably soon have given up the whole thing. Instead of calculating, however, he experimented, and so it happened that in 1866, he found that the whole of his very respectable fortune had been turned into glass. Thereupon, John Bull came to the rescue, and an English Company was formed, with Dr Salviati as its technical director; but though no doubt this was a great blessing for poor helpless Murano, it was hardly likely that the inventor would look on with equanimity while the large profits won by his own talents and great personal sacrifices flowed steadily into England. After a while, therefore, he resigned his post, and in 1877 founded a business of his own, and opened dépôts in all the chief capitals of Europe. A number of his old workmen gladly returned to him, while others set up

for themselves; and now Murano is once again the busy place it was in the olden days, while Dr Salviati has been loaded with orders, medals, and diplomas.

THE CLIFFORD DIAMONDS.

CHAPTER I.—WHAT WE THOUGHT OF THEM.

WE were a family of quite middle-class people, not in the rank of the Cliffords at all; and yet our dear father and our uncles were Sir Arthur Clifford's most intimate friends. That was how we came to know anything about the diamonds. We lived close to Grange, the grand old home of the Cliffords. It was a superb old North-west of England house, set in magnificent woods, overlooking the Irish Channel. Thorp Uplands, our home, was just a rambling place, which had grown with the growth of our family, from the squat farmhouse where our grandfather, Hugh Thorp, lived in his comfortable yeomanly style, to its present condition, when it might be termed a 'commodious residence;' not the least pretentious, but oh! so snug, with its long passages and unexpected staircases, and windows stuck in anyhow.

Besides our father and mother, there were six of us. Tom, our eldest brother, was in Uncle Thomas's cotton mill, which was situated quite near our farm; Paul, who was next to him, was in the navy, a messmate of Jack Clifford, Sir Arthur's second son; and our youngest boy Joe was in Uncle Hugh's warehouse at Liverpool. As Tom lived with his uncle at the factory, we girls ruled the roast at Thorp Uplands. There were Ruth and Naomi, the twins; and Olive, my humble self. Every day one or other of us went across the park to sit with Lady Clifford and read to her for an hour or so; then, if the day were fine, we would take her out for a walk round the quaint old garden, or drive her about the lovely park; for Lady Clifford had no daughters of her own, and was blind.

That was not the only trial which weighed heavily upon the great family of Clifford of Grange. There was a sadness, a blight upon them, which shadowed and oppressed them all; for they were poor, miserably poor for people of their condition. I have heard my uncle say that when all claims on the great estates were paid off, Sir Arthur Clifford had scarcely four hundred pounds a year to live upon. Young Arthur Clifford, the heir, was in the Guards, and Jack, as already mentioned, in the navy. Only that Lady Clifford had been an heiress, the sons must have done as our boys did—gone into business. Uncle Thomas said it would have been the wisest thing they could have done. Perhaps he was right; but then Sir Arthur and my Lady were old-fashioned folks, proud as Lucifer, and very tenacious of old ideas. I think the sight of her son with a pen behind his ear, perched on an office stool, would have driven Lady Clifford mad.

We were just yeoman folks a hundred years ago, we Thorps; but our grandfather was a clever, far-seeing man. He cast his eyes upon the rapid brook which summer and winter went babbling down the glen at the back of 'Thorp's Farm,' as the house was then called. An artist

might have thought of the beauty of the rushing stream; a poet might have jingled words to match its rhythm; but the practical Yorkshireman saw in it so much power running to waste; and after much bargaining, he obtained the use of it from the Sir Jasper Clifford of his time, a youth who was spending his income after the reckless fashion of the day, and who was glad to get the big sum Hugh Thorp laid down for the signing of the lease. The money went in a night at Brooks's; but the mill my grandfather built stands to this day.

We own a fair share of the Clifford estate too, and Uncle Tom is one of the chief creditors who have claims on the property. I often feel deeply for the Cliffords, because we seem to have risen upon their downfall. And yet the glamour of the old grandeur clings to the ancient house; to the handsome middle-aged baronet, and his still beautiful wife; to the Hall, with its great shadowy galleries, where generation after generation of painted Cliffords look down from the walls upon the decay of the family. But especially does the magic linger over the ancient chest wherein, fast locked in an iron-bound casket, reposed unseen the Clifford diamonds.

As children, we used to hear about their splendour from our dear mother, who had seen them gleaming in a flaming ring around Lady Clifford's slender throat, springing in an arch of fire above her gentle brow, and burning on her arms and bosom with a blaze like the sun at noonday. Wonderful things, too, were blent with those magnificent jewels in our imaginations: such as the magic gem which lit up a whole chamber by its glow, in one of those tales of wonder and delight, the *Arabian Nights*; Sindbad's Valley of Diamonds, from the same delicious volume; and pictures we had seen of Solomon's Temple; all which were brought to our minds by the mere mention of Lady Clifford's diamonds.

They were historic stones too; for the necklace and coronet had been in pledge to raise money for the king in the sad times of the Civil Wars; and the bracelets were a gift of King Charles II. to a fair Lady Clifford of his time. Then the earrings were made of jewels won by an heroic Clifford upon Indian battlefields in a later generation; while the stomacher was a trophy gained by another son of the house—his share of the plunder of a great galleon in the war with Spain. There were stars and pins and brooches too; and local valuation set down the diamonds as being worth a perfectly fabulous sum; but Uncle Thomas used to say they were not worth quite so much as people thought; and we somehow felt that he understood their value to a farthing. One day, when we were talking of them, he said abruptly: 'I say it is a sin and a shame to keep so much money lying idle in a box. Twenty thousand pounds-worth of senseless stones locked up, never seeing the light of day, while the Cliffords are in such want of money. It is simply madness.'

'Oh, Uncle Thomas, are they worth so much?' I cried. 'I thought they were not so very valuable.'

'Eh?' he said, turning sharply on me; 'you have more sense than I gave you credit for. Now, Ruth and Naomi there are firmly persuaded that those baubles are worth treble what I said.'

The twins lifted their voices in indignant protest. Uncle laughed, and went on: 'Yes; I call it a crime of the Cliffords to keep that large sum lying there while they are in such need.'

'But, uncle,' I said, 'surely things are no worse now than they have been for some time. The Cliffords do not seem to be in greater need of money than usual.'

'Humph!' uncle said, casting a meaning glance at the twins.

I understood him. He meant that there was something to be told which would not bear telling in the ears of 'the children,' as we still persisted in calling our two youngest and prettiest. Taking up his hint, I suggested a game of Spoil Five, an old-fashioned pastime, of which our good, kind-hearted, hard-headed uncle is exceedingly fond.

Uncle Thomas has never been married. He lives in a cosy unpretentious house close to the mills; and brother Tom, as already mentioned, lives with him. Of ourselves, I may say that I am older by three years than the twins, that is to say, I was five-and-twenty past that evening when we sat and played Spoil Five, and the twins were just twenty-two. They were wonderfully pretty girls; and alike in features, although quite different in colour; Ruth's hair being a deep russet brown; and Naomi's flaxen, with just enough of a warm tinge in it to light it up. Both had clear gray eyes; but Ruth's looked darkest, being shaded by very thick and long lashes the colour of her wavy hair. If I could choose between them, I should have called her the prettier of the two. She had more warmth and colour about her, and certainly she had the sweeter disposition; but every one called Naomi the beauty, and sometimes I joined the popular opinion. I myself am not a beauty; I never was. Only just a plump, good-humoured little lass; very brown and healthy-looking, with nothing special about my face save and except the Thorp eyes. We all had rather good eyes, and mine were no worse than the rest of them.

We were a very happy household; but for my own part, all the poetry of life lay at Grange. To go up the long winding avenue, under those beeches, which were planted in the days of the Restoration in place of the more ancient ones hewn down by Cromwell's troopers in the troublous times—to enter the grand old hall, where once the 'Merry Monarch' had banqueted with the young and fair Lady Clifford—to walk on tiptoe through those great rooms, silent and sad, but so wonderfully suggestive in their faded splendour—this formed the greatest pleasure, the fairest romance, of my young life. At home was honest prose; at Grange was an inexhaustible source of poetry and romance. And then dear Lady Clifford was so fond of me! Ruth came next in her affections; Naomi last; not that she was not fond of Naomi too; but then, of the three of us, she was the one who went least often to read and walk with her.

I think the first wave of the great tide of change which swept round us and altered everything, touched us that evening as we laughed and made merry over our old-fashioned game of Spoil Five. Once it was done, uncle kissed the twins, bade them good-night; and then, when they were gone, he turned to mother.

'Frances,' he said, 'can you spare me Olive for a

day or two? That house of mine is in a sad state for want of a woman in it, and she has such a way of bringing things into order.'

Mother smiled. 'Well, I can scarcely spare her,' she said. 'But as she is not going very far, I suppose I must do without her for a little.'

I was much surprised. Uncle never had made such a request before; and even to my unobservant eyes, it was plain that something underlay the trifling reason he gave for requiring my presence.

'When do you want her to go?' mother asked.

'Now—to-night, if possible,' Uncle Thomas said; and when mother demurred at the suddenness of the request, father cried from behind his newspaper: 'Yes, yes; let the child go. Why, it's only a step.' And I knew that there was some good reason why I should so instantly make a change of residence.

My preparations were not extensive. In half an hour, uncle and I were walking slowly along the winding path which led from the Uplands to the mills, a servant having preceded me with my box.

Once well away from the house, uncle stood still, and turned me round so that he could see my face in the silver light, for the moon was almost at the full. 'Olive,' he said huskily, 'I know you are a girl of sense.—Now, don't make any protest, because I have great faith in you. I've brought you down to my house. What for, do you think?'

I said I had no idea.

'Well, then—to entertain an unexpected guest.'

'Uncle?'

'Yes; that unhappy boy, Arthur Clifford.' Uncle spoke in a tone of deep vexation.

'Arthur Clifford! Why is he not at Grange? What has brought him home?' These and a host of other questions I poured out as we stood face to face in the moonlight.

He drew my arm through his, and we walked slowly down the path in silence for a few minutes, before he answered me. 'He has come home because he is in great trouble,' said my uncle in a low voice; 'and he has taken refuge with me because he dare not face Sir Arthur or my Lady.'

'In great trouble?' I questioned eagerly. 'What kind of trouble, uncle?'

'Money trouble.'

'Oh, that is the least of all troubles,' I said lightly, in my ignorance.

'Is it?' said Uncle Thomas bitterly—'is it? Child, how little you know! No matter. This unhappy lad has been driven to do a very foolish and dangerous thing in order to raise money. Now, he feels the consequence; and in mortal dread of an exposure, flies to me. Silly boy! I was very angry with him when he came this evening—very; but now I am beginning to pity him. He was placed in a very false position. Sir Arthur never should have put him in the Guards, amongst rich young fellows who need never give a second thought to what they spend.'

'What has he done, uncle?' I asked.

'I may as well tell you, knowing you to be a sensible little girl, and that what I say will go no further. He put his father's name on a bill for three hundred pounds, and now he

has not a ha'penny to meet it. The bill may be in Sir Arthur's hands to-night, for all we know.'

'Three hundred pounds is not such a very large sum is it, uncle?' I said gently.

'Do you mean that I might give it to him? Eh puss? I can't say I see my way to that at all,' uncle replied. 'No; I'm a fool about some things, I grant you, but not such a fool as all that.'

I walked beside him silently for a few paces; then he spoke again. 'Just see what want of money has done in that family. Here's this thoughtless youth just ruined; and'—uncle stamped his foot on the path—'here is a fortune under us—coal, my girl, coal and iron enough to make the Cliffords millionaires. No capital to work the mines; no energy to start them; and two as fine lads as ever lived just lost for want of money, while twenty thousand pounds lie idle in a box! It's enough to drive a man mad!'

'Why don't you start the mines yourself, uncle?' I said. 'You have energy enough, and money too.'

'Ay, but not years enough, my girl. No, no! I've got too many irons in the fire as it is.—Here we are. Meet the lad as if you knew nothing.'

It was easier said than done, for, as we entered the library at the Mills House, Arthur Clifford sprang forward eagerly to meet us. I fancied his countenance fell as he saw me; and an instantaneous flash of memory recalled sundry little things I had observed between him and Naomi when he was last amongst us. I remembered, even while I was shaking hands with him and saying how surprised I was to see him, that they used to play croquet together a good deal in those days, and that they danced together whenever opportunity offered. Could it be possible there was any kind of understanding between them?

Uncle Thomas had left us together, and for a while neither of us said much. At length Arthur lifted his dark curly head, and said abruptly: 'I did not expect you to-night, Olive.'

'Did you not? I suppose just as little as I expected to see you.'

'Well, no; not in that way, my dear girl. I knew Mr Thorp would bring *some* one back; but'—He stopped short, and cast a shy embarrassed look into my face.

'You did not expect *me*?' I said laughingly.

'No; I did not.'

'And which of us, then, did you expect?'

'Naomi.'

I laughed again—a forced laugh. Here were my suspicions proved true.

'I know she would have come over had she thought I was here,' he continued. 'Never mind. I'll see her to-morrow.'

I did not say anything; but perhaps he saw by my face that I thought it was not likely. He rose from his chair and sauntered to the hearth, where he stood leaning his arm on the mantel-shelf, and looking into the red depths of the fire for a few moments; then: 'This is an unlucky business, Olive,' he said moodily.

I do not know why, but it seemed to me as if he looked upon his evil deed rather in the light of a misfortune, than in that of a grave,

fault; and now a feeling of half-contempt mingled with the pity I had at first felt for him.

'Yes,' I said coldly; 'it is a bad business.'

'Pon my word, Olive, I had no idea it would turn out like this, when I just jotted down "Bart." after my name on the dirty scrap of stamped paper. See here; I give you my honour I wasn't responsible that day. We had been keeping it up rather hard—Pedder and Wilcox and one or two other fellows; and I—Well, the fact is I had been having too much liquor—don't look so shocked, my dear Olive; hundreds of fellows do it—and when old Shylock came bothering about the cash I owed him, in desperation I signed the governor's name to a bill.'

'Oh, Arthur!'

'Ay, you may say so; but you'd cry louder if you knew it all.' He lounged across the room to the buffet, poured out half a tumbler of sherry, drank it at a draught, and returned to the fireside. 'I've shocked you terribly, I'm sure of it,' he said, and paused moodily. 'What tempted the governor to put me into the Guards, I'd like to know?' he asked in a low bitter voice. 'It was like flinging a man into the fire, and not expecting him to be burned. Such folly!'

'It strikes me that you are ready to blame every one but yourself, Arthur,' I replied, for I was beginning to feel more and more contempt for the man as he stood there trying to vindicate himself. And could our dear Naomi care for him? My heart ached as I thought of it.

'Well, why shouldn't I speak the truth? It was madness of them to let me mix with a swell set of fellows without sixpence in my pocket. Look here, Olive—did you see the mother to-day?'

'No,' I answered abruptly. 'Ruth was at Grange to-day. I am going to-morrow.'

'Are you?' His face brightened. 'See here. One of those diamond stars of hers would pay up all, and set me on my feet. Perhaps you'd ask her?'

'I! ask her to sell her diamonds? Are you mad?'

'No; not the least bit in the world. I'd sell them all, the whole lot, if I had it in my power.'

'Arthur Clifford, I'm ashamed of you,' I said haughtily, and left him to his own devices.

A STATE BANQUET IN MADAGASCAR.

'Mr Frost, you are wanted for duty with the Admiral this afternoon, sir,' was announced with a grin by old Blowhard, our venerable quartermaster.

'That's rather a kill-joy for you,' sung out a voice from a neighbouring cabin, owned by C—, my opposite number.

For the benefit of the uninitiated, it may be as well to explain that one's 'opposite number' is the man who keeps the 'opposite' watch, or next watch but one, to one's self, and consequently the man to exchange duty with. Truly, it was rather a kill-joy, for C— had undertaken my duty that day, and I had made every preparation for an expedition to the marshes after duck.

I was soon enlightened as to the nature of the duty by a supplementary order brought by the midshipman of the watch, and delivered in what little Beckford thought a really officer-like style. 'Tail-coats, epaulets, white waistcoats, and swords, is the rig for officers going on shore with the Admiral, sir,' said Beckford.

'What's it for, Becky?' I asked.

'Oh! a feed, I believe, sir, with some of the nigger swells'—by which I understood Mr Beckford to intimate that I was to attend the Admiral to a state banquet given to him by the representatives of the Hova government at Tamatave.

Our good craft *H.M.S. Who's Afraid* had cast anchor in Tamatave Bay, Madagascar, a day or two before, and towards the end of as jolly a cruise as ever ship had the good fortune to sail; Tamatave being one of the last places we had to call at in the cooler and more southerly latitudes, before running up into warmer regions again.

Most of our hearts and some of our pockets stood sadly in need of repair. I was in the pitiable condition of suffering from both.

During the few days we had been lying in Tamatave Bay, I had found time for a cruise of inspection on shore, and had succeeded in discovering good chances of making a fairish bag of duck in the marshes. I had subsequently made all the necessary arrangements with my 'opposite number' for a free afternoon, when, as I have just described, my pleasant anticipations were shattered at one fell swoop by old Blowhard opening the wardroom door behind me and making the announcement already recorded. I believe, judging by the happy expression the old wretch wore, that he took a malicious pleasure in extinguishing the one bright spot in my otherwise gloomy prospects.

Half-past three is an awful time for a square meal; but the Hova government are evidently not of Sydney Smith's opinion with regard to lunch being 'an insult to one's breakfast, and an injury to one's dinner,' and had fixed upon an hour which heaped insult and injury on every other meal of the day.

There was no shirking it; and half-past two saw us all arrayed in our 'war-paint,' packed in boats, and towed ashore by the steam pinnace. It was a lovely afternoon in the cool season, with a light southerly monsoon blowing, and a regular fleecy trade-wind sky. About twenty minutes' steaming of the sturdy little pinnace brought us to the principal landing-place of the chief town on the west coast of Madagascar.

It was apparently a grand day amongst the inhabitants of Tamatave. A large crowd of those who had nothing better to do had assembled on the strand to see the Admiral and (as the newspapers have it) his numerous and brilliant staff. Those 'who have nothing better to do' seem to form the major part of the population of an African town.

The costume of the natives is simple and inexpensive; not being an artist, I cannot say whether it is picturesque, but I should say it is cool enough. It struck one that the intelligent Malagash had flung himself head-foremost into a grass-cloth pillow-case, and had succeeded in boring his round woolly black head through the closed end of it, and in poking his arms out at the sides.

Comparing, however, their costumes with our heavy blue cloth and gold lace, I was bound to admit that the natives in that respect were really the more civilised race of the two. Standing on the hot sand under a blazing sun, in the same dress we are accustomed to wear in the Channel, made us feel very 'Turkish-bathy,' and possessed of less wisdom than our dusky brethren.

All that was to be seen of the great city from the landing-place was a row of huts, with a wooden building kept as a restaurant by an enterprising Bourbonese. But in front of the row of huts was a sight which the natives thought could not fail to strike even us with awe. It was the guard of honour! The men composing it were drawn up in line facing us, and as the Admiral stepped out of the boat, they went through their performance in grand style. They were a guard representing, I imagine, all the military forces of the island, for they were dressed in every conceivable uniform—cavalry, hussar, artillery, grenadier. Even a marine uniform was in the ranks. They were rigged out in cast-off English uniforms. Trousers seemed to have been issued only as a mark of distinction, for they were not universally worn. I thought it a doubtful benefit, comparing the temperature of Madagascar with that of the country they had been originally meant for. The arms seem to have been provided on the principle on which a boy collects postage-stamps, namely, to get as many different sorts as possible. The most impressive part of the proceeding was the salute. The commanding officer stepped out and yelled his orders in English. (This was perhaps meant as a compliment to the British Admiral, or resulted from the fact that a retired sergeant of our army had been instructor-in-chief to the Madagascar army). 'Silence in the ranks!' he bellowed forth. No talking was going on at the time; if there had been, the order would not have been understood, being given in English; but I suspect, as Jack says, 'It's in their gunnery-book, and they has to say it.' 'Rear rank, take opin ordah!' was next yelled out. There wasn't any rear rank, so I don't know how the commanding officer got this order executed. As there was no appearance of a hitch anywhere, and he made no pause, it was apparently done to his entire satisfaction; and the next moment he sung out, 'Shoddah ums! Present ums!' and the Tower musket, the old flint lock, the chassépôt, the double-barrelled gas-pipe, the German gun, and the rest of the collection, came up to the 'Present' more or less together.

The Admiral returned the salute with an immovable face. He loved a joke, and had as keen an eye for the ludicrous as most people; so the command of his countenance must have cost him an effort.

The scene of our banqueting was some way off, and the governor had provided chairs and the usual team of four bearers for each officer, to convey us from the landing-place. These chairs are simply seats with a back, which are secured to long poles, and a small board slung underneath to rest the feet on. The bearers are fine sturdy fellows; and the distance and pace they go at are simply marvellous, especially

when one considers the simple fare they live on.

Our road lay along the principal street, which runs the whole length of the town. The houses on each side are nearly all one-storied wooden houses, occupied by French residents from Mauritius and Bourbon. They seemed cheerful, clean, and tidy little houses enough. Our mode of progression may be an every-day sight to these good folks; but the sight of an English Admiral and all his officers in full fig carried shoulder-high on apparently nothing but two long poles, struck me as rather comical.

As we approached the entrance to an old and rather dilapidated-looking fort, a coated native dashed past us to turn out the guard stationed by the narrow passage through which we were to enter the courtyard. The guard consisted of one man in the uniform of a dragoon, but without trousers, followed by another with a sword, as officer of the guard. The latter seemed rather put out that his guard was so small, but determined to do his best before the foreigners, and make up for the smallness of the guard by the extra grandeur of his orders. The guard visibly trembled at the sight of us, but the officer was equal to the occasion. 'Silence in the ranks!' he roared out, standing on the right of the sentinel, and putting his mouth about an inch or two from the poor fellow's ear. 'Rear rank, take opin ordah!' he next shrieked out to the unhappy warrior. The sentry stood the yelling in his ear pretty well, and at the third order, 'Shoddah ums!' he threw his old gas-pipe about in capital style. When the salute was over, the order for the other part of him to take close order was given, and the guard dismissed. He looked a happier man, and retired into the kennel which was his guard-house with the air of having done something to deserve well of his country.

We alighted in a courtyard just inside the walls, and a narrow flight of steps brought us into a mud-built room over the fort. It was a very long low room, with few windows. The table was spread for between twenty and thirty guests, and I could not help meditating prospectively on its stuffiness when all should be present. We were received by the governor, who, with a Princess of the blood-royal, did the honours. She was a stout, cheery little body, with curly hair, nearly white, who spoke French perfectly, having, I believe, been educated in France. The Minister for Foreign Affairs of the Hova government had come down from the capital to meet the Admiral, and was also there to receive him.

Madagascar is rather strangely divided into two races—the Hovas and the Sakalavas. The former are recognised by us as the ruling race, and their government is held responsible in all dealings and treaties with our government. The Hovas are not, however, entirely masters of the island, for the Sakalavas hold a great deal of the southern and western parts of it; but they must eventually come under the Hova rule, for the latter, in place of being divided into innumerable tribes, are united under their Queen Ranavalamanjaka, and are certainly making rapid strides in civilisation.

The governor of Tamatave, the judge and

other officials, the principal inhabitants, our consul, a missionary gentleman, and ourselves, completed the party. The Hova gentlemen were dressed in sober black of Parisian fashion of a former date. We were received as if we had been entering a European court, our hosts bowing profusely. A few of the Hova officials could speak a little French; one could even speak a little English as well—he was, I think, the Minister for Foreign Affairs.

The usual introductions being over—a thoroughly British method of shaking hands was adopted—small-talk, and very difficult small-talk, was attempted. English-French and Madagascar-French don't fit in at all well; so, after a few remarks which we neither of us understood, my Hova friend and I dropped into a mutually accommodating plan of 'Oui, oui,' and a smile after each other's stuttering attempts. After some interesting conversation of this description, we took our seats, or rather stood behind them; for, as a sort of preliminary grace, the healths of Queen Victoria and Ranavalamanjaka were proposed. Certainly the good folks in Madagascar are more loyal than we are; there is much greater merit in thinking of one's Queen when hungry before a meal, than after it, when one is usually—that is, if the dinner has been a good one—rather inclined to think well and kindly of all. The toast was received by all with loud applause, though the liqueur in which it was drunk was poured out of a bottle looking suspiciously like 'hair-oil,' and tasted like a mixture of lime-juice and glycerine. The health-drinking over, we settled down to the real business of the day. The governor sat at one end of the table, and the other end was pretty well filled by the fat jovial little Princess—Julie by name.

There was a long pause after the soup, and an uneasy stir was perceptible amongst our hosts. There was an occasional inquiry from the governor, and a message sent off by a slave; but with no satisfactory result. Our laboured attempts at polite and easy conversation made every minute seem an hour, for even 'Oui, oui,' grew a trifle uninteresting, after being repeated a few hundred times. Things must have been looking serious indeed; for in about ten minutes, the governor despatched the Chief-Justice to the kitchen to discover the cause of the delay. He returned from his mission looking very blank, and no ray of hope cheered the heart of the governor. Punishment is severe and summary in Madagascar, and I trembled for the fate of the cook and his staff. Another local swell, a species of Lord Mayor, was next sent posting down to the kitchen, but he returned ere long, having been as unsuccessful as the Chief-Justice. There was a decided hitch somewhere; and I was beginning to congratulate myself on a happy escape, when the fat little Princess jumped off her seat, and accompanied by the Minister for Foreign Affairs, toddled out of the room, no doubt making for the kitchen, to discover the cause of the delay. Either her charms had been irresistible, or the Minister for Foreign Affairs had taken up a very decided 'Stand-no-nonsense' sort of tone with the head of the culinary department, for they returned triumphant in a few minutes. They each headed a column of blacks who streamed into the room after them, bearing huge dishes,

on which lay enormous roast turkeys, geese, ducks, and guinea-fowls. The number of dishes was something stupendous. After the first detachment had deposited their burdens on the table, there was a slight confusion, for there was no room for the second instalment which was being carried in by the next column of slaves. However, by dint of squeezing and shoving, they were all located, and three roast animals per guest were provided by our hospitable entertainers.

Now the battle raged fast and furious. The slaves bustled about, placing the good things before us. The various dishes were, I believe, excellent, all cooked in the French style; but one could not get over a certain nervous feeling about them—an Englishman is so absurdly squeamish about his food. (By the way, I presently discovered that the cause of the delay in the appearance of our second course had been a block in the street between the French restaurant where the dinner was cooked, and the banquet-hall; a most probable occurrence, seeing the crowd of slaves who were employed to bring the viands.)

We were pretty merry in spite of all; and as our remarks could not be understood except by the Minister for Foreign Affairs, who was well away from my part of the table, we managed to indulge in a little innocent chaff. Our harmless prattle was flowing smoothly, when suddenly a crash was heard in the courtyard below, which almost lifted us off our seats, and made us look wildly round the table and at each other, to find out what on earth it could mean. The crash was followed by a braying, drumming, and shrieking, as if three regiments of drums and fifes and about fifty buglers were all practising their several calls at the same time, entirely independent of each other. I wondered if they had designs on bringing the roast turkeys, &c., back to life. When we had recovered from the first shock of the thing, we could trace the faintest suspicion of a tune running through it. One of us, who affected an ear for music, pronounced it to be an attempt at *God Save the Queen*. We loyally stood up. It went on for an unconscionable time; but at length they stopped—I thought for want of wind.

Before starting for this entertainment, the Admiral, who is an awful old wag himself, had told us very solemnly that there was to be no laughing, and that our deportment was to be one of great gravity and decorum. It was a precious severe trial of our discipline in this respect when after a short pause the band set up a more hideous bray than ever, and when, at the end of the performance, we heard him remark very blandly: 'Ah! that's very pretty, very pretty indeed. What is the name of this piece?' To which His Excellency of the Foreign Portfolio replied: 'Him no got proper name; him only Malagash tune.'

The 'Malagash tune,' mercifully varied with a few 'brilliant flashes of silence,' was resumed and continued till the period for the toasting and speechifying arrived. The little Princess left the end of the table—as a sign, I suppose, that the ladies had withdrawn—and took her place next to our consul in a semi-official capacity as interpreter; and most efficiently did she perform that

office. Our consul made the first speech, and, as far as my knowledge of French would allow me to judge, it seemed a particularly good one. He had to pause every now and then, to allow the little Princess to translate what he had been saying into the Hova language. The speechifying being over, that pitiless band again pealed forth its terrible thunder; but as soon as politeness would allow, the Admiral, to our infinite delight, made a move to go. We found our 'four-in-hands' in attendance, stopping the way below. The bearers, no doubt, had been enjoying the dulcet strains of their native music while we were at table.

We were on board again by seven. It had been something entirely new, and something to fill a letter home with; so, though I had missed my duck-shooting, I was not altogether sorry I had gone.

THE SERVANT-GIRL QUESTION.

How to obtain good domestic servants, who will give their services for reasonable periods of time, and so reduce to a minimum the necessity for those repeated changes which disturb the even tenor of our family life, is the perplexing problem which is vexing heart and brain in thousands of households in our country. That it may ere long occupy a foremost place on the list of social questions pressing for solution, is no doubt the devout wish of many a matron who can think and speak feelingly on this subject.

The domestic-servant difficulty has already been dwelt upon in the pages of this *Journal*, and hints touching mutual relations have been suggested to mistress and servant, for the consideration of both. But although satisfactory results may be expected, and do in some instances flow from efforts mutually put forth in the direction indicated, it is still a discouraging fact that they are exceptional in the experience of a considerable number of mistresses. Within the remembrance of many persons now living, it used to be no uncommon event in the life of a servant-girl for her to remain five, ten, and even fifteen years in her situation. It is an event of more frequent occurrence nowadays for a kind-hearted lady, actuated it may be in the first place by motives of charity, but none the less anxious to secure the services of a good servant, to admit some waif or stray into her household, teach her a servant's duties, and after having brought her to a fair degree of efficiency, to have the mortification of seeing her protégée at the expiration of six months quit her service for that of another mistress.

The difficulties which beset the domestic-servant question would seem to call for the application of some extraneous means—some established, organised methods, by means of which we could reach out a friendly hand to our servant-girls, appeal to their self-respect, promote their interests, and hold out to them inducements to exercise zeal and diligence in the discharge of household duties, to aim at excellence and fidelity in the performance of them, and, moreover, to seek to attach themselves with greater constancy to the service of their employers. We have already pointed out that the great want of the present day is some extended organisation by which young girls could

be trained for household duties. Once established and fairly set in working order, such an organisation would, under able management, soon make its influence felt in the Metropolis, and its example be followed in country towns where branch Societies would be established, which might derive certain advantages from affiliative association with the parent organisation. Some modification in the nature of the work done, and in the rules and regulations in force at the latter, might be necessary in the case of branch Societies, the rules and regulations of which should be adapted to meet the special requirements of each district.

Leaving the task of formulating a plan for establishing a Metropolitan organisation to the residents in London, it may not be out of place here to attempt a brief though imperfect sketch of the organisation of a Society such as we hope to see at some future day established throughout the country. We will begin by appointing a managing Committee, composed of ladies and gentlemen, and by laying down the wholesome fundamental principle that our Society shall be self-supporting. Perhaps it is too much to expect that our intentions will be realised directly; but our aim should be to make the Society self-supporting. Our rules and regulations—to be amended and improved, as wisdom and expediency may suggest—might for the present take something like the following shape, namely—

1. Members of the Society to be composed of girls who are candidates for domestic service, and girls who are already in service. Before being admitted as members, girls are to satisfy the Committee that they are honest, sober, and of good moral character—qualities essential to membership. A small entrance fee and annual subscription to be charged. Age of members on entrance, and the amount of fee and subscription, to be determined by the Committee.

2. With the object of promoting habits of providence and thrift, each member shall, on joining the Society, be expected, or even required to become a depositor in a savings-bank, and continue so during membership.

3. One year's unbroken service in her first, or failing that, in her second situation, with a good character from her mistress, shall entitle the member to an official certificate of character. The service to date from membership.

4. Two years' continuous service in her situation, dating from membership, with a good character from her mistress, shall entitle the member to a good-conduct certificate. This certificate to constitute a recommendation to situations where higher wages are given, and to be issued by the Committee.

5. Three years' continuous service in her situation, dating from membership, with a good character from her mistress, shall entitle the member to a first-class certificate of merit, in which may be inserted any special qualifications or recommendations applicable to her case. This certificate to be issued by the parent Society in London, and to constitute a recommendation for superior or first-class situations in the country.

6. Facilities shall be afforded to members in situations to attend at half-price—with the sanction of their mistresses—lectures or enter-

tainments of an instructive and elevating character: a limited number of tickets to be issued from time to time, as the Committee may determine.

7. A Servants' Register shall be kept, in which entries are to be made of the names and ages of (1) members who have not yet been out to service, and are eligible; (2) members who have served one year in a situation; (3) certificated members who have been in service for two years and upwards; (4) members who wish to avail themselves of the instruction and training afforded at the parent Society, with a view to obtaining situations in London; and (5) the names of ladies in the town and neighbourhood requiring servants.

8. Arrangements for interviewing servants to be made on certain days.

9. Registration fees to be charged as determined by the Committee.

It may be urged, and not without reason, that large sums of money, and possibly much labour, would be necessary in order to establish and carry on an organisation of this character. But nothing of this nature is free from trouble and expense; and if these were found to be fruitful of good results, it need hardly be said that the organisers might be considered as amply rewarded.

W O N.

SHE was so young and fair,
I could not choose but love her. At her feet
I laid my heart and life—an offering meet.

And when with sweet assent
She let me kiss her trembling lips divine,
I thought that none could part us—she was mine!

Alas, poor hope! Stern words
From sterner parent came: 'I cannot yield;
Go thou and fight in Life's great battlefield.

'Fresh laurels win. When rings
Our land from east to west with thy great fame,
Come then and ask me may she bear thy name?'

With weary hearts and sad,
Beneath the summer stars we bid good-bye,
And vowed to love, through weal or woe, for aye!

Year after year passed on,
And yet, alas! still flowed the changing sea
Between my heart's desire—my life's one love—and
me.

At last, with willing feet
And glad, I homeward turned. My task was done.
Once more within my arms I held her—won!

White-robed, like angel pure,
She came—my bride—to gladden all my life.
I cried: 'They cannot part us now, sweet wife.'

The joy-bells rung o'erhead,
The birds sung on, as hand in hand we passed
Into a strange sweet life—love-crowned at last.

CHAMBERS'S JOURNAL

OF

POPULAR

LITERATURE, SCIENCE, AND ART.

Fourth Series

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 977.—VOL. XIX. SATURDAY, SEPTEMBER 16, 1882.

PRICE 1½d.

NEWSPAPER EDITORS AND THEIR WORK.

NEWSPAPER editors are personages with whom, in the mind of the public at large, there has always been associated a certain degree of mystery. There is no class of men whose work passes so directly and so constantly before the public eye; yet there are few with regard to whose real position and functions more vague, confused, or erroneous notions are entertained, even on the part of persons otherwise well informed. This is no doubt largely due to the anonymity which is preserved in the newspaper press of this country. Readers come to identify the opinions of a particular organ more with the sheet of printed paper, and with its distinctive name and features, than with the individual or individuals by whom it is directed, and of whom, it may be, they know nothing.

The power and influence, with their attendant responsibility, exercised by the editors of our great newspapers, are enormous. Thomas Carlyle once described journalists as the true kings and priests of the nation. The office so described is a most attractive one for young men in search of a career, especially if they be fairly educated, and believe they are imbued with the fire of genius. The commonest mistake of such aspirants to the editorial chair is that they greatly under-estimate the attainments requisite for such a position. They speak of 'taking to journalism,' as if it were a very simple matter, to be accomplished without much personal trouble or inconvenience, and never thinking of the long years of patient work and varied experience which will have to be undergone before they can reach the point they have in view. Journalism is now, and is becoming more so every year, a profession for which a special training is required. There have been instances in which men of brilliant parts and profound erudition have proved signal failures in the editorial chair; while men of inferior education and meaner intellectual powers, but with those indispensable

qualifications—tact, judgment, and experience—have succeeded admirably under the same conditions. It is, therefore, quite erroneous for a young man to suppose that because he has had the advantage of a good education, writes with facility, and has a notion of such work, he can 'take to journalism' and surmount all difficulties, as it were with a pair of seven-league boots.

Some years ago, a young man wrote to an American paper that he wanted to be an editor; and the reply which he received is well worth reproducing here. 'Canst thou,' asked the editor, 'draw up leviathan with an hook thou letest down? Canst thou hook up great ideas from the depths of thine intellect, and clean, scale, and fry them at five minutes' notice? Canst thou write editorials to measure? Canst thou write an editorial to fit in a three-quarter column of the paper, which shall be in length just twenty-two inches, having three inches of fine sentiment, four inches for the beginning, and nine inches of humour in the middle, and an outburst of maxim and precept, six inches long, at the close?'

This will of course be regarded as a bit of facetious exaggeration on the part of the editor, and no doubt it was; but it really reflects certain necessary phases in the work of a journalist. Important intelligence frequently arrives at the newspaper office within a short time of the paper going to press, and if the editor wishes to be up-to-date or ahead of his contemporaries, as most editors do, he must have a leading article on the subject in the same issue as that in which the news appears. There is not a moment to be lost; indeed, there may be scarcely time to perform the mere mechanical operation of writing what has to be said, not to speak of hunting about for an idea, an appropriate quotation, or a choice form of expression. These must all, in the language of the American editor, be hooked up, cleaned, scaled, and fried without delay.

Most leading newspapers have one or more political articles in each issue, and these, while parliament is sitting, often deal with the previous night's proceedings in the House of Commons. It

frequently happens, however, that the Cabinet minister whose speech is to be commented upon does not rise till the night is far advanced, or it may be that the division which is to determine the whole drift and tone of the article does not take place till one or two in the morning. In the former case, the speech has to be reported, transcribed from shorthand into longhand, and despatched to the various newspaper offices—by telegraph, of course, in the case of provincial papers—the respective editors meanwhile fretting and fuming over the delay which is keeping back from them the material upon which their principal leader is to be based. In such emergencies, an experienced journalist may construct a considerable portion of his leader by anticipation. To use a slang expression, he 'knows the ropes.' He is familiar with the subject, can form a pretty shrewd idea of what the minister is likely to say, may even have had some private hint on the question from official quarters; and leaving to the last his more particular references to the speech of the evening, successfully accomplishes his task. This, however, is a kind of sharp practice which cannot always be indulged in with safety or convenience.

Some editors who possess great facility in composition, employ a shorthand amanuensis, to whom they dictate their leading articles and reviews. In an emergency such as that we have described, or on any occasion when time presses, the editor would dictate to his amanuensis a portion of his leader, writing the remainder himself while the first half was being transcribed from shorthand into printer's 'copy.' The editor's work is not, of course, always done at this high pressure, which would soon wear out the mental and bodily powers of any man. Nor is the ability to turn out good work thus rapidly all that is required of the successful journalist. Upon the editor of a large daily paper devolves the direction and oversight of a complex system, which, properly conducted, produces what may justly be described as one of the marvels of the nineteenth century, but which, if badly or injudiciously managed, would soon involve its promoters in financial ruin.

Of some of the difficulties against which the editor has to contend, none but practical newspaper-men have any conception. Take, for example, the question of space. It is a common fallacy among the general public that it must be a very difficult matter to find news to fill each day's paper. So far from this being the case, the ingenuity of editors and sub-editors is continually on the stretch to find space for even a selection of the most important news at their disposal. In the office of a leading daily newspaper, there is often more matter thrown into the waste-basket, or struck out of manuscripts, than would suffice to fill the paper; while interesting telegrams, for which not only the Post-office, but the correspondents who have sent

them, will have to be paid, are consigned to the same receptacle almost every night, simply because it is impossible to find a corner for them. The calculations of the editor, moreover, are liable to be upset in a hundred different ways. Some great crisis, storm, crime, or disaster occurs, or an important debate suddenly arises in parliament, or some great man dies, or there is an extraordinary and unexpected influx of advertisements—perhaps a combination of these—and all the arrangements of the office are correspondingly disturbed.

An entirely different set of difficulties and dangers beset the editor from without, and to meet these, no little tact and discernment, as well as an extensive knowledge of men and things, are necessary. The acquaintance, or at all events, the favour of a man in whom so much power is vested, is naturally courted by public and official personages in almost every order of social and political life; and not by these alone, but by a still larger constituency of busy-bodies and adventurers—place-hunters, men with hobbies, men with inventions, philanthropists, reformers, literary and poetic aspirants; men indeed—and women sometimes as well—of every class, whose purposes and interests can be promoted in any way by 'favourable mention' in the paper. Only a small proportion of these appeals elicit any favourable response on the part of the judicious editor, who knows that he must exercise the utmost vigilance to escape the snares which are laid for him by those self-seekers.

Though these competitors for favour are a great bore to the editor, their anxiety to stand well with him is occasionally the means of his procuring valuable information which he could not otherwise obtain. It is to them he is often indebted for communications as to the proceedings of private meetings and 'close' corporations. It is owing to their propitiatory offerings that he is now and then enabled to burst a bomb-shell in the camp of his political opponents, by disclosing their secret machinations, and explaining all the details of their little schemes. It is through them that he is sometimes enabled to expose, to the derision of an amused and edified public, the intrigues of official and municipal life.

But what kind of people are editors personally, when the mysterious curtain which hides them from the public gaze has been drawn aside? The question is one to which no specific answer can be given, for a more heterogeneous class of men does not exist anywhere. The diversity observable in the newspapers which issue from the press daily, weekly, or otherwise, is nothing to that which exists among those who direct them. If all the editors of newspapers published, say, in the English language were brought together in one vast assemblage, they would form a curious gathering, not the least remarkable feature of which would be its heterogeneous composition.

In such an assemblage, it would be interesting to pick out the comparatively few who may be regarded as having reached the very top of their profession, who conduct the most powerful organs of public opinion, who enjoy the confidence and friendship of the greatest statesmen

of the day, and who move in the highest literary and artistic circles. After them, we might perhaps be able to recognise a few of the more notable among a much larger number, who, though stars of lesser magnitude as compared with those in the first rank, enjoy a very considerable share of honourable distinction, and who, both personally and professionally, exercise an influence which is neither dubious nor circumscribed. We should then have to contemplate the most numerous class of all, who may be described as the rank and file of our great editorial army, composed of men who, though perhaps but little known or recognised beyond their own particular sphere, are doing good and admirable work, and who, only within a more limited radius and in more localised affairs, exercise an influence little less than that of their more distinguished brethren.

Last of all, we should be curiously interested in a considerable number who, hanging on, as it were, to the outskirts of the concourse, may be said to belong to a somewhat nondescript class, each section of which is made up of men of the most opposite views, acquirements, and methods, carrying on their operations under the most diverse conditions. Yet there is this most interesting feature to be noticed, that though in each of these various sections we find men who have reached the limit of their possibilities, and some who have at one time held higher rank in their profession than it is now their lot to fill, there are at the same time to be found in each, even the lowest grade, men who may yet aspire to the highest, and in the highest, men who have risen from the lowest. This is no doubt true of almost every profession; but the fact has this peculiar significance in regard to journalistic work, that steady and sustained promotion can never be the outcome of anything apart from genuine worth and efficiency.

There is no profession in which a man stands more supremely on his merits than in that of journalism. In many others, promotion is more a question of influence, of good fortune, or of time, than of actual working capacity. In journalism, influence goes for little or nothing, unless there be on the part of the aspirant real efficiency to perform the work that has to be done. There never was greater competition in the press than there is at the present day, and that competition is more likely to become keener than to diminish. It is becoming more and more a question of the survival of the fittest, and special eminence is ever more difficult to attain. The incompetent and inexperienced, therefore, must inevitably go to the wall.

We have said that there are men now occupying the highest ranks of the journalistic profession who have risen from the lowest. As illustrating the various stages of such promotion, it may not be out of place to mention a case in point. We could name the editor of one of the most powerful daily newspapers published in the United Kingdom who began life as a lad on the bottom-most round of the ladder—in the printing office; who, by his own unaided industry and perseverance, entered, through various stages of preferment, upon the work of reporting, and passed from one grade to another in that department, till, after a wide experience of provincial and general work, he reached what is in many respects the most im-

portant sphere in which that arduous calling is exercised—that of parliamentary reporting; and who, throughout an extended experience in the Gallery of the House of Commons, acquired a knowledge of political affairs, of the relations of parties and of statesmen, and of the intricacies of parliamentary procedure, which must have proved invaluable to him in the subsequent periods of his career. The remaining stages of sub-editorial and editorial work were duly passed through, and his present position attained. The majority of our most successful journalists are self-made men.

The press is every year becoming a greater power in the land; it is already one of the greatest 'resources of civilisation,' and we might as soon try to get along without steam, or railways, or the post-office, as without our newspapers. If we are to have newspapers, we must have editors to direct them, and the editors must march with or in advance of the times. There is therefore good reason to hope that better things are in store for the coming generations of journalists than there have been for those that are gone, and that on the newspaper press the best talent, the maturest judgment, and the most cultivated taste will yet find congenial and appropriate work.

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

CHAPTER XXXVI.—AND NOW HE BEGAN TO KNOW HOW FUTILE HIS DISHONESTY WOULD HAVE BEEN EVEN HAD HE SUCCEEDED.

OVER London a dull gray sky, obscuring the last sun that shines this month of May. Over Lumby Hall a leaden sky that weeps and weeps; and round about it, a maudlin wind that moans. In London City, beneath that dull gray sky, the great House of Lumby and Lumby once more flourishes, and lifts a head the prouder for defeated shame. In Lumby Hall there are hearts that beat in answer to the City triumph, and throb with sweeter and more human joys; for in Lumby Hall there is this great joy, that the master of the house, long stunned by terrible calamity, is beginning to know the forms and faces round him and to remember names.

You who are old, and have lived your lives, and bred your children to usefulness and honour, do you remember any happier times than those when your children began to know you, and to reach out chubby arms for you, and to make lingual stumbles over 'father' or 'mother'? None sweeter, I dare answer for you. Yet in this house was a still deeper and more sacred joy; for the head of it was coming out of a dreadful dream of childhood, that had been renewed too early; the brain that once had concocted great schemes, was again active; the weak heart that had led large enterprises, was once more beginning to pulsate aright. He was coming back slowly to conscious life, and would by-and-by hear glad tidings—as though some mariner who had suffered utter shipwreck should wake to find his good craft whole again, and the drowned comrade's hand holding his with the grasp of friendship.

Wailing wind and clouded sky around and over Lumby Hall; and such gay and tender

hearts within it. Low-lying skies above the great refurbished house of Lumby and Lumby in the City. Strike fast, free wings, and bear us on. The British Channel gray and misty; the coast of France with a glint of sunlight on it; the fields of France bright with broad sunshine, and many a cornfield waving in the wind. On southward and westward, till we pass the awful hills, and hover beneath a blazing sun and in the burning summer air of Spain. And southward now to Cadiz, where we drop, swooping downward with sure flight to strike our fancied quarry—Garling!

Garling on the shady side of a narrow street, walking with bent head and hands behind him as of old, looking an incarnate secret here, as in London City half a year ago—Garling self-banished, with all his wicked schemes foiled and broken, and his heart broken with his schemes—Garling among his ghosts again.

'Do you love me well enough to trust me?'

'I have no words to tell you how I love you.'

Then a chamber with a dying woman in it, and a cheap clock hurrying on the time and stumbling in its haste to get the horror over. Then a dream-journey by cab and rail and sea. Then a real journey by cab renewing the dream-journey; a railway station filled with hurrying crowds, faces showing here and there in the gas-light, and lost here and there in the gloom; a platform almost deserted; a green light turning a sudden eye upon it; a lamp swinging; a whistle sounding; a hand upon his arm, and a heart which seems for a second as though it ceased to beat. His own. If it would but cease to beat! If it would but cease!

Lost—all lost. The game played quite in vain. Familiar voices in the street laugh at the lost gamester—familiar faces smile derisively. He hears the voices—'When did ever villainy thrive? There is a fate in these things.' He reads the meaning of the smile. 'We were fools enough to believe this shallow fellow a financial genius.' Is it bitter? Is wormwood bitter? He would rather live on wormwood than face that smile. And it mocks him always, awake and in his dreams, and there is no escape from it.

A night at sea, with a moon struggling to pierce a bank of clouds; the sea crying with waste voices. The game played out, and played in vain. A figure on the deck of a ship which floats a black hulk on the waste gray heaving waters—a figure with bent head and hands folded behind him, ghost-tormented. Garling, in this lonely narrow Cadiz street, walks with bent head and hands folded behind him, and knows that figure on the ship's deck and knows the ghosts that haunt him. He knows the figure, flying with false passport for the swindler's refuge, Spain. 'EDWIN MARTIAL, aged 49, height 5 ft. 6 in., complexion sallow;' and so on, and so on. He has that phantom's passport in his pocket. He sees the gray ghost landing at the quay; he sees him taking lodgings, walking the streets of Cadiz day by day, eating his phantom heart out as he goes. Then in fancy the ghost shoulders him, and as it were melts into him, and he and the ghost are one. He and the ghost walk on together to a café in a by-street, and go in together.

Years before, when the cashier first meditated on his crime, he had begun to qualify himself for a residence in Spain. There is but little pleasure to be got in any foreign country if you are a resident there, cut off from communion with your own countrymen, unless you know the language spoken by the people round about you. Garling was not a common villain, and had set to work, having once made up his mind to flee to Spain, to learn Spanish. It is not a difficult language; and though he spoke it like a stranger, he learned to read and write it as glibly and correctly as his mother-tongue. But though he was not a common villain, and though his majestic plot had been wrecked by chance, and not by any fault inherent in it, he had fallen into the one curious blunder of fancying that perpetual leisure would bring with it unrestricted pleasures. Well, he had got perpetual leisure, and it was gall. The bare fact that he was without employment crushed him. He had lived plainly, though to his very heart a gourmet, promising himself the pleasures of the table. He was not so poor even now, with the honest savings of his lifetime, that he could not command those pleasures, and he had no joy in them. He had loved good wine, and though holding himself back from it, had lusted after it. It had lost its flavour and its sparkle. It did but upset his Spartan stomach and make his head ache. He had lived for the World and the Flesh, and he was here surrendered to the Devil; and the world was empty and ashen and gray; the joys of the world were years and years behind him.

And now he began to know how futile his dishonesty would have been even had he succeeded, and he groaned inwardly many a time, and acknowledged the truth of that base but salutary proverb which says that honesty is the best policy. He began to feel the proverb base as well as true, for a plain reason. It is but a poor reason to be honest—that it pays. Honesty has a better plea than that. It is honest, whether it be a good policy or not. And so this able scoundrel—this swindler of genius—was crushed before the last blow fell upon him. And here and now the last blow was to fall.

Spain is not an advanced country, and has done her best or her worst to sweep the tide of human progress back from her shores. Spain is the staunch old uncompromising Tory among nations. Yet even Spain could not shut out that glorified and beatified Paul Pry we name 'the press.' She could fetter Paul. But for once in a way he brought the truth home, and struck it deep to the heart of a remorseful, but not yet repentant, villain; for Garling took up from the marble-topped sloppy little table in his café a Spanish journal, and therein read this narrative. Paul had garbled the story a little, as you will see, but he was right in the main.

'A singular romance has just transacted itself in London. The last chapter of this romance reserved itself for Madrid, and is therefore of especial interest for our readers. The great company of Lombardo Brothers, who probably take their name from Lombardo Street, the great

banking quarter of England, was lately compelled to suspend payment. For more than twenty years the affairs of the Company were conducted by One Garling. The name and the persistent character of the criminal alike point to Scandinavia as his birthplace. One Garling was a gentleman of the loftiest repute, and was chancellor of the City Exchequer. He was completely trusted by the Company and was believed to conduct their affairs with unequalled skill and probity; but in reality he was a criminal of daring genius. During the whole of the time for which he was intrusted with the conduct of affairs, he was engaged in the elaboration of a scheme for the ruin of his employers, a plot to which he appears to have been stimulated by a hatred of the City institutions. The result of defalcations spread over a long series of years, amounting to twenty-five millions of reals, was deposited at Madrid, and One Garling himself escaped to this country. It now transpires, however, from the statement of the English journals, that he was detected before his flight and compelled to sign a confession of his misdeeds, by Sir Lombaro, the head of the City Company. Sir Lombaro also succeeded in extorting from One Garling a complete restitution of the stolen moneys. But now begins the romance of the story. Sir Lombaro, who is presumably old and frail, was so affected by the emotion of the time, that he lost his reason, and having mislaid the drafts, he allowed the City Company to become ruined.

Garling dropped the paper on the little marbled table, and stared before him with a ghastly face. He saw already that he had a second time missed his prize. He took up the paper and read on.

'The establishment was therefore declared bankrupt, and its properties were seized by the law officers. The books containing the accounts of the association were sold for waste-paper; and in one of them, the confession of One Garling, and the drafts made by him upon the Spanish Bank at Madrid, were miraculously discovered. Application was immediately made to the Madrid authorities, and it was discovered that in spite of all his cunning, Mr One Garling had allowed the money to rest in their hands. It was therefore withdrawn by the authority of the miraculously-recovered drafts, and the City Company is thus re-established. It is seldom'—And the Spanish Paul glided from history to morality, and preached the natural sermon.

Garling read on steadfastly to the end. With that marvellous fatuity which attends and produces crime not yet crushed out of him, his spirit writhed in incredible bitterness under this final misfortune. Since his flight, he had never until now taken up a newspaper. He had supposed that as a matter of course the merchant had communicated with the Madrid Bankers long before he himself had set a foot in Spain, and now he found that the money had been still lying at his call until within a few days ago. He had told himself a thousand times since his exile from England, that money was valueless to him. He had discovered beyond any chance of denial that the time for such enjoyments as he had promised himself had gone by—that his appetites were effete, that the life he had led in London had

so moulded him that his leisure was an agony, and his heaping up of money the foolishness of all possible blunders. And yet he writhed in spirit at what he read. He was Fate's fool, it seemed, he who had thought himself so cunning. Cunning? The man's belief in himself crumbled. Where were the fertility of resource, the unshaken constancy to self which he had boasted all these years?

He felt a singular curiosity to know how long a time had elapsed between the loss and the recovery of the drafts. He sat for an hour, thrumming on the table, with bent head, seeing nothing that went on about him, and scarcely thinking. Nobody to look at him would have supposed that any very dreadful trouble weighed upon him. Trained so long to impassivity, his face kept a fair copy of its usual expression, and he passed for an idle gentleman whiling away the time in mere reverie. But the curiosity he felt drew him to the Spanish Paul. He paid for his coffee, inquired his way to the office of the journal in which he had read the news, and in due time reached it. Señor Parria, a courteous-mannered gentleman, received him. Garling explained his mission. He was Mr Edwin Martial, an Englishman, having business in Cadiz, and for the present residing there. He had had transactions with the great House, and had known Mr Garling. Perhaps his curiosity as to the authenticity of the story might be pardoned. Assuredly, replied the swarthy Señor. The facts as related had appeared in a journal published in the Spanish capital. Since then, the English mail, by some cause delayed a day, had brought the English journals to Cadiz. The swarthy Señor regretted that he himself did not read English, but—would the inquirer care to search the papers, and if need be, go back on the foreign file and discover any reference to the story? Mr Edwin Martial was obliged. He declined the cigarette proffered by the courteous editor; he sat down with his hat on the floor beside him, and looked through the file of a London daily preserved for the past three months. There he made out the whole of the story. He saw himself denounced in a slashing leader as the Prince of Modern Swindlers. The lash of the virtuous leader-writer's indignation fell harmlessly upon him. The eulogy of his artifice brought him no comfort. He saw of course through all the guesses the virtuous leader-writer made, and passed on calmly to search for the next article. For two or three days he made a figure in the world's news, and then he dropped out of it for five or six weeks. Then he came back again with a burst, and for another day or two he made the most interesting item in journalistic intelligence. The leader-writer was at him again, and rejoicingly denounced him as the Prince of Modern Dullards. He brought his leader to its proper length by an affecting eulogium upon the virtue of honesty, and the paying properties of that attribute; and he pictured with considerable pathos, the restoration of British Mercantile Honour to its old place in the confidence of the trading communities of the world.

Garling read everything he could find, and the courteous editor cast an eye upon him now and again, and never made the remotest guess as to his identity. It was natural enough that any British mercantile person should be interested

they are conical in shape, much sharper than the canines of a dog or cat. When a fish is caught, the otter immediately transfixes it through the head with his sharp canines, the action of which is such that the fish is held by them as in a rabbit-trap, and cannot escape. The otter holds the fish for some little time between the canines before he begins to eat, waiting till it is quite dead and quiet. In eating, he never uses his canines at all, but bites at the fish with the side of the mouth only. The molars and premolars are also very sharp, but capable of crushing any substance into very small bits.

While engaged upon the Herring Commission Inquiry, Mr Buckland made a voyage to the north in H.M.S. *Jackal*, and he gives a graphic description of his experiences while visiting Orkney and Shetland, together with Fair Island. The last-named island seems to be a general rendezvous for many of the sea-fowl which migrate to and from the far north. 'The common and Black-backed gull and the Kittiwake are here the whole year, but are much more numerous during the breeding season than at any other time. The eider-duck, the guillemot, the puffin, and sheldrake come about the middle of April, and remain till October. The puffin and guillemot seem by general consent to have fixed on the 12th of August as the day of their departure. Thousands may be seen a day or two before that date, but only a few solitary birds after it. The black guillemot remains here the whole year. The gannet and fulmar come after the breeding season. The stormy petrels breed here; but though their young are frequently seen, the nests are rarely if ever found. Swans and many different kinds of geese visit the island yearly for a few days in spring and the beginning of winter. Both kinds of cormorants are found here the whole year round; they often drift ashore in considerable numbers, dead or very much weather-beaten, during long-continued storms.'

Frank Buckland was great at shows, and seldom lost an opportunity of visiting them. Being in Yarmouth on business, 'of course,' he says, 'I went to the shows, where the best thing by far was the Hairless Horse. Yes, he was perfectly hairless, as bald as a billiard ball. His hair had not been shaved; he had never had any. Some part of the skin was white, the rest black: the white was very white, like the skin of a sucking-pig; the black was the black of the edible Chinese dog, also called the "India-rubber dog." There was also on view a "Living Skeleton"—certainly a skeleton something awful to look at. He was said to be thirty-four; he might have been any age. He was awfully thin. His wrist would pass through a gauge of one inch and one-eighth. I asked the skeleton what he lived on. He said: "Rump-steaks and porter." Anyhow, he certainly did not grow fat on it. I went also to see a "Petrified Mummy," about which the showman of course had a long yarn to tell. This was an old friend that I am continually coming across at penny shows—namely, the "Abogine." The history of the "Abogine" is as follows: He is a dried Australian native, thrown in as a bargain with some spears, shells, &c., in a lot, and bought by a dealer. The shells, &c., were sold,

but not the dried Australian, and the dealer got quite tired of his bargain. At last he called him an "Abogine," and chopped him to some penny showman for some monkeys. The poor "Abogine" does not get on; showmen can't make money out of him. The "Abogine" of course means "aboriginal native," only the word has been a little twisted.'

In a chapter on the London Birdcatchers, Mr Buckland gives a number of interesting particulars relating to the notes of various songsters. Thus, his friend 'Mr Davy's call-bird goldfinch was a very good one, and Mr Davy put his song into words. By listening attentively, I could make out that the goldfinch did really say the following words. There are two songs of the goldfinch; one is—

Sippat-sippat-slam-slam-slam-siwiddy.

The other is—

Sippat-widdle-widdle-slam-siwiddy-kurr-hurotle-chay.

Goldfinches are now becoming very scarce, because the cultivation of land is exterminating the thistles. At the end of the year, the birds lie up in quiet feeding-places, and remain there as long as the food lasts; they will not be seen on flight again until April.

'The song of the wild linnet is thus written by Mr Davy:

Hepe, hepe, hepe, hepe,
Tollaky, tollaky, quakey, wheet,
Heep, pipe, chow,
Heep, tollaky, quakey, wheet,
Lug, orcher, wheet.

'The toy linnet is a bird that has been taught to sing by the titlark, woodlark, or yellow-hammer; they are educated at an immense amount of trouble. The linnet is taught "in-and-in," "in-and-in;" that is, by constant repetition; and only a very few take the perfect song. The song begins thus:

Pu poy, tollick, tollick, eky quak,
E wheet, tollick, cha eyk, quake, wheet.

This is one stave of the song. Then follow in due order the following staves:

Phillip, cha eke, quake, wheet.
Call up, cha eke, quake, wheet.
Tollick, eke, quake, chow.
Eke, eke, eke, quak chow.
Cluck cluck, chay, ter wheet tollick, eke quake,
wheet.
Echup, echup, pipe chow.
Ah, ah, ah! J-o-e.
Eke quake, chow rattle.
Tuck, tuck, wizzy ter wheet;
Tolliky, quake wheet.

This is the finish of the toy linnet song. When the above song is put together by a properly trained bird, it is just like a flute.

'To get these birds to take the song, they must be taken from the nest very young, before they get the call of the parent-birds.

'Perfect toy linnets are worth almost any sum of money; fifteen to twenty pounds would be given readily for a thoroughly good one. Broken song-birds are only worth thirty to fifty shillings each. A broken song-bird will not make his stops in the song as given above; he will run one stave into the other. Good toy linnets are very scarce, and their trainers are getting old and dying off.'

In 1878, the new lion-house at the Zoological Gardens was built, space being left for large outdoor playgrounds for the animals. The transfer of these large carnivora from their old dwelling required great care and a thorough knowledge of the habits of the animals, more especially as they are extremely suspicious, and very frightened at anything having the appearance of a trap. Formerly, the animals were made to move from one den to another by setting fire to some straw, and thus starting them; but in this instance Mr Bartlett preferred to employ stratagem rather than force, and had a strong box constructed called a 'shifting-den,' which was placed opposite the door of the cage. A tempting bit of meat placed between the bars at the far end of the box, eventually induced one of the animals to enter, when an attendant pulled a cord, and the slide fell down, thus making him a prisoner. In this way all the animals were transferred without much trouble to the new house. Singular to say, it was found more difficult to trap those which had been born in menageries and lived all their lives in confinement, than others which had come to the Gardens after being in a wild state. The difficulty of transferring the animals from the indoor dens to the playground was overcome by constructing an iron box, both ends of which could open or shut at will. This box was placed upon wheels, and by means of a tramway, shifted along the wide passage which runs between the dens and the playground, allowing communication between any two of the doors as required.

The carnivora were released for the first time in June 1879, when it was found how well the tunnel plan had answered. The tigers having ascertained that the door at the back of the den was wide open, and apparently communicated with the open air, naturally took advantage of what they thought to be a sure means of escape. The first tiger that went through the tunnel belonged to H.R.H. the Prince of Wales. 'This tiger was a cautious gentleman. He approached the tunnel with the greatest caution, testing its stability with his huge paw at every step. The spectacle of the four tigers coming out into the open was really grand. First, there appeared the head of a tiger; he surveyed everything outside for a minute, and then cautiously came out, creeping along cat-like, without the least noise. It was indeed a beautiful sight to see these lovely gigantic cats, the four tigers, gradually emerge one by one into their new, large, open playground. By a little imagination, one might easily fancy that the scene was situated in the middle of India, and that the tigers were coming out from their fastnesses to seek their food.

'When they arrived at the open, it was very beautiful to watch them crouch down, making themselves appear as small as possible. Finding nothing to hurt or alarm them, they curiously examined the trunks of the trees and rockwork placed there for their especial benefit. They trusted to their sense of smell and touch for objects near them, and to their sense of sight for objects distant from them. When the four tigers were loose in their playground, and the door closed behind them, they at once began to play, and very beautiful were their movements as they ran after each other, tumbled, and gambled like young kittens, their coats looking like

satin in the warm sun. All of a sudden, a new and, to them, a most interesting object made its appearance. This was a young and very white zebu calf of a few days old, which came out of its shed in full sight of the cage only a few yards off. The moment the Prince's big tiger saw it, he crouched to the ground, and remained stationary, watching the innocent-looking baby zebu. He was all fixed and statuelike, perfectly motionless except the very tip of his tail, about two inches of which kept jerking from side to side, signifying great anxiety, expectation, and readiness for immediate action. Presently the other three tigers perceived that their comrade had seen something. They also instantly assumed various attitudes of contemplated attack, indicating their intense desire to kill this young zebu calf and eat him. This group of four magnificent tigers, all intent upon one and the same object, was grand in the extreme. It was also very interesting to observe that the mother of the young zebu seemed to know instinctively that her calf was in danger, as she appeared to warn it in her own peculiar way. I left the four tigers still looking at the zebu calf, when we adjourned to watch the lions come out into their playground at the other end of the four large iron cages.'

In a paper upon singular accidents to animals, which had come under the author's observation, the most curious is that which occurred to a stag in Windsor Forest. The forefoot of the animal having become fixed in the fork of a tree, possibly while he was searching for food among the lower branches, he was unable to extricate himself; and the limb breaking, he had fallen upon his back, and probably died slowly of hunger.

The efforts of Lord Bute to acclimatise the beaver in the west of Scotland, which have now met with success, are touched upon by the author, who narrates several interesting anecdotes of this most industrious little animal which he noted while upon a visit to Mount Stuart House; a notice of which appeared in our columns several years ago.

Mr Buckland in the course of his book has some amusing notes on the sea-serpent, together with observations on the habits of the manatee, and a valuable chapter on the structure of whales. In speaking of the *Beluga* or white whale, an example of which was lately at the Westminster Aquarium, the author mentions some curious facts in connection with the breathing functions of these immense creatures. After explaining how seals and other lung-breathing animals have the power of remaining under water, he says: 'In the whale we find altogether a different kind of self-acting breathing-valve. The wind-pipe does not communicate with the mouth; a hole is, as it were, bored right through the back of the head. Engineers would do well to copy the action of the valve of the whale's blow-hole; a more perfect piece of structure it is impossible to imagine. Day and night, asleep or awake, the whale works his breathing apparatus in such a manner that not a drop of water ever gets down into the lungs. Again, the whale must of necessity stay a much longer period of time under water than seals; this alone might possibly drown him, inasmuch as the lungs cannot have access to fresh air. We find that this difficulty has been anticipated and obviated by a peculiar reservoir in

the venous system, which reservoir is situated at the back of the lungs.'

We will not draw further upon the many interesting topics which Mr Buckland places before his readers, but would recommend the book itself, not only to all lovers of nature, but to the general reader as well.

THE CLIFFORD DIAMONDS.

CHAPTER II.—WHAT WE SAW OF THEM.

WE were not a very pleasant party at breakfast at the Mills House next morning. Uncle's brows were knit. My brother Tom could not conceal his disgust at young Clifford's conduct; and I felt miserable when I thought of Naomi. Yet I had one crumb of comfort—the preference might be all on one side. I had never seen anything in my sister's demeanour to warrant the supposition that her affections were engaged; and then, how could she help a young man's fancy for her? I had just reasoned myself into a quiet frame of mind about her, when uncle announced that he was going to Grange, and that he must have a few minutes' conversation with Clifford. I thought Arthur followed uncle with a very bad grace; and I was not surprised to see the two men issue from the library with set, angry faces.

Surely never was there so slow and weary a morning. The gardens were a good way off, beyond the great mills. I did not care to go there, lest uncle should suddenly return and require me; I could not talk to Arthur Clifford; and I had not the heart to play the piano. As a last resource, I took down a volume of Ruskin, and forgot my worries.

'Olive, I've brought you your letters.' Naomi was standing at my side, with half-a-dozen letters in her hand, looking uncommonly well and bright. 'I've got such a jolly letter from Uncle Hugh,' she went on. 'There is to be a delightful fancy ball in Liverpool next month. He wants us to go as "Night and Morning"—Ruth in very dark blue and silver; and I in pale blue and gold. He says he'll give us our frocks if papa only will let us go.'

'And what does papa say?' I inquired, well pleased that her mind was full of such thoughts.

'Oh, he said he'd think of it; which is, being interpreted, we'll go.'

'Now, Naomi!' I cried, lifting a warning finger. 'Oh, you dear old tabby, I don't mean anything profane, only—Arthur Clifford!' She drew back, looking so white and startled, that I felt startled too.

He came gaily forward, a bright smile on his handsome face, a proud light in his full dark eyes. 'Yes, my dearest girl; just Arthur Clifford, and no one else. Are you not glad to see me?' He extended both his hands and caught hers. 'Have I startled you out of even a word of welcome, Naomi?' he asked.

She recovered herself in a moment. 'Yes,' she said; 'I am surprised. I did not think you would have come so unexpectedly.'

'How could I tell any one I was coming, when I did not know it myself until ten minutes before I left London?' he said.

'And what brought you home?' she asked, gently disengaging her hands.

He made a grimace.

'I suppose you have been going a little too far with one of your numerous flirtations?' Naomi remarked, very coolly.

'Now, I call that horribly unkind of you, Naomi,' exclaimed Clifford in an angry tone. 'I've never had a single flirtation since you told me that you'—

She lifted her hand ever so slightly; but I saw the gesture, and drew my own conclusions. I felt grieved to the soul. These two had been carrying on an underhand courtship.

'I am shocked—shocked and surprised, Naomi,' I said; and like a goose, I began to cry.

She put her arm around me. 'Don't cry, Olive, pet. Really, there's nothing to cry about. It's half fun.—Now, isn't it, Arthur?'

'O yes—only fun altogether,' he answered with a laugh.

But what they said to comfort me, only made my pain the keener. I restrained my tears, however; and seeing there was no help for it, I endeavoured to wrest a promise from Clifford that he would confide in uncle. I talked myself almost hoarse before I could get a reluctant half-promise from him to that effect; and then I partly coaxed, partly ordered, Naomi to return to Uplands. Arthur would have insisted upon accompanying her across the lawn, had not uncle's burly form appeared in the avenue.

I was leaving the room as uncle entered, with a look on his face such as I had never seen before. 'Stay!' he said, in a voice which made me shake.

I returned to the chair I had left a moment before. Uncle closed the door, and walked to the fire without a word. Clifford watched him with varying colour and flickering eyes. Through the profound stillness of the room, I could hear the slow tick-tock of the clock and the hum of the adjacent mill. My heart began to beat heavily as I looked at the two men.

At last Clifford spoke. 'Well, sir, you have seen my father?' he asked.

'Yes.' Uncle's voice was harsher than I could have believed.

'Am I to go to Grange?' the young man said.

'No. Sir Arthur will never see your face again.'

It was I, and not the young man, who cried out in horror at uncle's words. What Clifford said was: 'Never's a long day.' And I thought there was most unseemly lightness in both tone and words.

'You have broken his heart,' uncle answered sternly; 'and for my part, I will never touch your hand in friendship again. Arthur Clifford, I'd rather have followed your father's eldest son to his grave, than stand here to-day knowing what I know of you.'

Clifford's face grew livid, his eyes seemed to contract into two fiery points, and his mouth worked convulsively. 'I suppose you know the whole affair now?' he said recklessly, turning on his heel.

'I do,' uncle said. 'The bill to which you put your father's name, unauthorised by him, was not for three hundred pounds, but for three thousand.'

'That's the whole business,' Clifford said; 'and all the rascally Jew gave me was two thousand, and some rubbish of pictures.'

'And for this you have spoilt your life, ruined your prospects, and broken your father's heart.'

'O sir, it's not so bad as all that.'

'Quite as bad. In your father's name, I have telegraphed to Lord Learmount, asking him for leave of absence for you—as your father's old friend, he will not refuse it—and then, you must flee the country.'

'Flee the country?' he cried amazed.

'Yes,' said uncle sternly; 'or remain here to be arrested as a felon—a forger.'

He winced at that. His teeth clenched so sharply on his under lip that the blood sprang, and his hand clutched the back of a chair fiercely.

'And where can I go, sir?' he asked hoarsely.

'To Liverpool—to my brother Hugh. He will put you on board his ship, *The Twin Sisters*. She sails for Brazil to-morrow. I have settled all with your father.' Uncle spoke in short sharp gasps, as if prolonged sentences were beyond his reach.

Clifford made two or three paces up and down the floor. 'I cannot go. I have no kit, no money,' he said.

'Hugh will supply anything you require for your journey. You shall have one hundred pounds lodged in the hands of our man of business at Rio; and—well, the same sum paid to your credit twice a year, so long as you remain away.'

Clifford gave a bitter laugh. 'When do I start on my swim?' he asked.

I never saw such a look as uncle darted at him. It made me tremble. 'You leave this house to-night at seven o'clock. I will go with you to Liverpool, and see you off in the ship.'

Two days after, uncle returned, and Arthur Clifford was on his way to Brazil.

Well, there was no scandal. The man in whose hands the bill was, lost nothing; he got his three thousand pounds, and a little over, to hold his tongue. No one ever knew the magnitude of the young man's crime save Uncle Tom, Sir Arthur, and myself; for Lady Clifford thought, with the rest of the world, that he had got into a scrape, as young men will, and that in a boyish freak he had run off to see the world; and that he would come back a steadier and a wiser man. I dreaded meeting Naomi, however. How was I to tell her what manner of man this was to whom she had pledged her faith? And yet, when we met, I felt deeply amazed at her gay and careless demeanour. The fancy ball, her beautiful dress, and the enjoyment she was to have at Uncle Hugh's, seemed to occupy her mind, to the exclusion of everything else. And yet, my mind misgave me.

To me she never alluded to the secret I had discovered, and the subject was too keenly painful for me to open it to her; and so a month went by, and the day of the great ball drew near. Ruth was to go as 'Twilight,' Naomi as 'Dawn;' and the dresses were designed by an artist-friend of Uncle Hugh's. They were really beautiful—one all cloudy, dark-blue tulle, and silver gauze; the other, pale blue, with gold stripes flashing through it. In her floating azure robes, with her golden

hair turned back from her white forehead, and a cloudy gauze veil floating over her shoulders, Naomi looked supremely lovely; while sweet Ruth's fair face gleamed like a star on the edge of a soft night-cloud from her misty draperies. Lady Clifford seemed to take a strange pleasure in hearing about the dresses; and the day before the ball, she called me to her side.

'Olive,' she said, 'I have asked Sir Arthur if I may add a little to the beauty of your sisters' dresses to-morrow night. He has given me leave to do what I will. Come with me, dear.'

Half expecting what was to come, I attended her through the familiar room; and then at her direction led her down the wide hall; and through many winding passages to a little dark closet off Sir Arthur's office. She gave me a bunch of keys, pointing out the one I was to use first, and then the others one by one. I opened four great iron-barred doors before I came upon a square box, which, at her bidding, I carried out and set on the desk in the office. The key which opened it hung on her watch-chain; she gave it to me, and I opened the box. For the first time in my life, I saw the Clifford diamonds. There were eight trays in the box. The upper one contained the tiara, seven stars set on two glittering bands of gems. How they beamed out at me, as if glad to catch the light of day upon their glittering facets; and how they gave back light for light in that dim sombre little room, before the beautiful eyes that could not see! I could not speak for a moment, because thoughts came rushing upon me which took my breath away.

'The tiara is uppermost,' Lady Clifford said, softly and sadly, her slender fingers touching the blazing jewels gently, regretfully.

I told her yes, while tears I could not restrain fell silently down my cheeks. To the blind, what worthless things are diamonds, after all!

'The necklace comes next,' she said.

I lifted the tray, and saw it. Nor could I repress a cry of wonder and admiration. It was superb. Three rows of blazing stones formed a collar for the throat; and from that collar depended nine stars, more brilliant, more gorgeous than those in the tiara. The centre star hung low in front; and from it descended three smaller ones, each vying with the other in brightness; while looped from star to star, forming a continuous festoon of flickering splendour, ran a diamond chain, like a river of light.

'Beautiful, is it not?' Lady Clifford said, with a sad smile. Yet I would give it and all the rest for a sight of your little face.' It was the only murmur of discontent or plaint I ever heard from her dear lips.

After she said it, I lost all care for the splendid jewels; their glory seemed dim, their beauty worthless. I lifted tray after tray, and looked at the glittering baubles with contempt. What were they worth, after all? Their radiance could not heal a broken heart, or purchase for their owner one moment's peace of mind.

'Have you come to the last tray, Olive?' Lady Clifford said, in her gentle level voice.

I told her 'yes.'

'You will find a star and crescent there,' she said. 'They do not belong to the Clifford diamonds. They were a bequest from my dear

mother, so that they are my own, to be given as I please. You'll give Naomi the star, as a little remembrance of a poor blind woman, whose darkened hours she has brightened a little. And the crescent is for my sweet Ruth. I'll send her no message, because she'll understand. And you—you, Olive—lift the case containing the star and crescent; your gift is there.'

Apart from the rest, it lay in a case of its own, a cross of pure flame. Not diamonds this, but rubies—rubies, set in a crust of tiny diamonds, burning like living fire. I clasped my hands.

'Oh! dear Lady Clifford! this is too much,' I cried, scarcely knowing what to say.

'Take the three cases; put the rest back, and come,' Lady Clifford answered, with a sad smile. 'Olive, you have helped me so long to carry my weary cross, that this shall be a token to you of my gratitude. Dear, you know whose price is above rubies; you are one of the few.' She kissed me tenderly, and we seemed to grow nearer to each other after that, than we had ever been before.

Reserving the dear lady's gifts, I put the rest of the diamonds back into their prison, and left them there. Many days went by, many changes came to us all, before I saw them again.

Ruth and Naomi went into ecstasies over their superb presents. Dear little Ruth ran up to the house to fling herself at Lady Clifford's feet, half crying, half laughing, wholly charming, in an ecstasy of delight.

Naomi took her gift much more coolly. 'I suppose I'll have them all some day,' she said. But she wrote Lady Clifford a very graceful letter; and she wore the star set in her golden hair at the ball; while Ruth's cloudlike veil fell from her sparkling crescent, and floated from her bright face like a mist behind a week-old moon.

After the ball, we seemed to slip back into the old smooth-running everyday life. Uncle Thomas came and went as usual. Sometimes I went to the Mills House and spent a few days there. Sometimes Ruth went, but never Naomi. Had uncle guessed her secret? Often I felt guilty concerning it, and yet I never had courage to ask the truth of him. Between my sister and myself, there was never a mention of Arthur Clifford's name; and yet, by some woman's instinct, I knew full well that she heard from him. Lady Clifford heard from him too. He was in Brazil, at first; then he went northward; and about a year after his departure, a letter from San Francisco told his mother he was settled in California.

Was it that spring or the next one that our brother Paul and Jack Clifford returned home? I can scarcely be certain; at anyrate, they came amongst us with the daffodils; and with the falling leaves, sweet Ruth went from us to the Hall, Jack Clifford's wife. Jack was as unlike his elder brother as two men born of the same parents could possibly be. Unlike in face, in form, in disposition; the soul of honour, truthful, straightforward, incapable of deceit, brave and daring, yet gentle as a woman. He and I were of the same age; we had been boy and girl together, and I loved him; but he was not to blame. He had his choice; and if it fell upon my sweet sister, it was no fault of his or mine.

I think Lady Clifford knew, for she grew more

loving and tender with me than ever, and now that the families were so closely linked, made me her confidante in many ways. Uncle Thomas and Uncle Hugh both added their splendid share to our dear Ruth's dower. She went to her husband nobly portioned; and the stately old baronet received her as his daughter with open arms. We all rejoiced in her joy; but I—I wore my blood-red cross in silence.

Naomi's temper did not grow sweeter for dear Ruth's happiness. I think that the contrast between the brothers was an evil thing to her, and that Ruth's perfect happiness cut her to the soul. She heard from Arthur Clifford pretty regularly, although he wrote from a different place almost every time. Now he was in Mexico, now at New York, now at Boston. Twice he wrote from some unknown place in the Far West. Once he told her he had been amongst the Mormons. Sometimes she told me little bits out of his letters, but oftener far she merely said where he was. So two years went by, and in the third year, the letters began to grow fewer and fewer—at last they ceased.

She only set her red lips more proudly and held her head a little higher. No one could observe any other alteration in her lovely face or self-possessed demeanour.

I was standing one morning that year by the library window, when I saw Tom come flying up the avenue from the mills. He must have seen me before I saw him, for he came running towards me, and leaped through the open window. 'Go at once to Grange. Sir Arthur is'—

I filled up the pause he made, crying out: 'Dead?' as the room seemed to spin round with me, and I reeled back into a chair.

'Now, that's just the way of all you women,' cried Tom impatiently; 'going into faints all over the place, instead of having your wits about you when they're most wanted.'

His impatience roused me to a sense of all Sir Arthur's death involved. 'I am not fainting, Tom, not a bit. Tell me what I can do—tell me how,' I could hardly speak.

'There you go again. Pick yourself up, and go to the house as quick as you can. My lady is in a terrible state.'

I knew she would be stricken to the soul; and so I made an effort, and ere the news had spread far, I was at her side.

Sir Arthur's end was sudden; but for years he had known that it might come at any moment. As to his poor wife, she knew the parting could not be for very long, and she took comfort. Ruth and her husband were abroad, at Malta. Of course they came as soon as possible; but Arthur Clifford's whereabouts was not so easily discovered; that he was somewhere in the States, we fancied, but nothing more. Nor did we hear anything of him until the grass was green upon his father's grave. The Uplands was but a dull house for bright Naomi in those days, and so she made frequent long visits among our friends. She happened to be at home when Sir Arthur died; but feeling bored, as she called it, by the cloud which fell upon us all then, she went to Liverpool, as the nearest harbour of refuge from the dullness of home. Just one

month after her departure, Ruth came down to Uplands on a summer morning with a letter in her hand.

'Olive,' she said, 'I have some wonderful news to tell you. Arthur has written to his mother, telling her of his marriage.'

'O Ruth, his marriage!' I gasped.

'Yes. Why shouldn't he marry if he chooses? He is married to a Miss Almeria Scadder, a great beauty and a great heiress. They are on their way home. Here is the letter; read for yourself.'

I took the paper out of her hand, and read it, amazed. How was I to tell Naomi?

WOLF-CHILDREN.

IN depicting the temper and disposition of the wolf, such adjectives as 'ruthless, cunning, and treacherous' are invariably used, and with perfect justice. It would appear, therefore, at first sight almost incredible that there should be many instances on record where children have been carried away, and instead of being devoured, as would assuredly have been the case had the marauder been a panther or leopard, they have been suckled, tended, and reared by them. Some of these have afterwards been recovered; and at this moment there exists a specimen wolf-child at Secundra, a small missionary station a few miles from Agra; so that the story of Romulus and Remus may not be so entirely without foundation as we have hitherto been led to suppose.

Wolves as a rule prey upon the flocks and herds of the inhabitants of the villages in whose neighbourhood they have made their dens, and upon such wild animals as they can hunt down and capture. Among these latter may be mentioned the gazelle-antelope and the black-buck; and many and ingenious are the devices they resort to in order to achieve their purpose. But in the North-western Provinces of India, as about Agra, in Oude and Rajpootana, they are also very destructive to children. Hindus of all classes are exceedingly superstitious regarding the destruction of these predatory brutes, and consider the individual who has been unfortunate enough to shed a drop of wolf's blood, doomed to suffer some grievous calamity. Hence, though a government reward of three rupees per head is offered, it is only the very lowest of all castes—the 'Domes or Dungars,' as they are called—who will take the trouble to snare and destroy wolves. These people lead a vagrant life, and bivouac in the jungles, and have no superstitious dread of killing any living thing.

The following hypothesis may explain how it comes to pass that so cruel and relentless an animal as the wolf should sometimes be found enacting the interesting part of foster-mother to one of the human species. A female with cubs goes prowling about in search of food for its young, and succeeds in ravishing an Indian home of its infant for that purpose. The cubs,

for some reason or other—not over-sensitiveness, certainly, but perhaps because their carnivorous instincts are as yet comparatively dormant—merely lick the child all over. This probably, according to the code of wolfish etiquette, is equivalent to having eaten salt with an Arab, and the infant is henceforth adopted by the parent, and suckled and brought up with the cubs. Although the human tendency is to go on two legs, we know that even amongst ourselves babies commence by crawling. Now, man is essentially an imitative animal, and seeing the wolves going on all-fours, the alien naturally tries the same method of progression. It would appear, however, that it has found the hands ill-adapted for use in lieu of forefeet, and as a rule the elbows are employed for that purpose; in consequence of this choice, the knees too have to be used instead of the feet, and hence horny excrescences are usually found on both the knees and the elbows.

Perhaps the two subjoined true narratives of wolf-children that have been captured in India, may prove interesting.

One morning many years ago, Mr H—, who happened at the time to be magistrate and collector of the Etawah District, was out riding, accompanied by a couple of sowars or mounted orderlies. They were passing over a portion of road that lay in the vicinity of the ravines of the river Jumna, when two half-grown wolf-cubs crossed their path; and following them more slowly, came a very remarkable-looking creature, which shambled along on all-fours in an extraordinarily uncouth fashion. This turned out to be a wolf-child. Letting the other two go unmolested, the three men proceeded to hunt down the human cub, and succeeded in bringing it to bay. As they wished to take the creature alive, and were altogether unwilling to hurt it in any way, they found the greatest difficulty in attempting to secure it; for it fought, bit, and clawed with extreme fierceness and pertinacity; indeed, having driven it into a corner, Mr H— and one of the sowars had to mount guard, while the other native proceeded to the nearest village, and got a stout blanket, for the purpose of throwing it over its head; and it was by this means that the capture was at length effected. All the way home, the wolf-child behaved like a mad thing, screaming and howling, now piteously, now in a paroxysm of impotent rage. It was, however, taken to Mr H—'s house; but it would not be comforted, and for a long time refused all kinds of food, including raw meat. The creature was a boy of about nine years of age; and it may here be stated that no female wolf-child has ever been heard of or seen. It is not easy to assign a sufficient reason for the fact that females have never been so discovered, unless we suppose that, being less vigorously constituted, they have been unable to withstand the terrible hardships of such an existence, and have very soon sickened and died.

In appearance, this boy was exceedingly repulsive; his features were blunt and coarse, and

their expression brutalised and insensible. As for his habits, they were exactly those of a wild animal.

Mr H— caused minute inquiries to be made throughout the neighbouring villages as to whether the inhabitants had lost any children through their being carried off by wolves, and if so, whether they could recognise the human waif that had been recovered, by means of birth-marks, moles, or other such indelible tokens. In the course of a few days the father and mother of the lad were discovered. They identified him by certain well-defined marks about the breast and shoulders, and stated he had been carried away when about two years of age. His parents, however, found him very difficult to manage, for he was most fractious and troublesome—in fact, just a caged wild beast. Often during the night, for hours together, he would give vent to most unearthly yells and moans, destroying the rest and irritating the tempers of his neighbours, and generally making night hideous. On one occasion, his people chained him by the waist to a tree that stood near the hut, which was situated on the outskirts of the village. Then a rather curious incident occurred. It was a bright moonlight night; and two wolf-cubs—undoubtedly those in whose companionship he had been captured—attracted apparently by his cries, while on the prowl, came to him, and were distinctly seen to gambol about and play with him, with as much familiarity and affection as if they considered him quite one of themselves. They only left him on the approach of morning, when movement and stir again arose in the village.

The wolf-boy, however, did not survive long. Accustomed to the wilds for at least half-a-dozen years, captivity and the change in his mode of life appeared not to agree with him, for he gradually pined away and died. He never spoke a word; nor did a single ray of human intelligence ever shed its refining light over his poor debased features.

The next story is taken from a work published some five-and-twenty years ago, by a then well-known Indian political officer.

‘There is now at Sultanpore a boy who was found in a wolf’s den, near Chandour on the Goomtee River, about two and a half years ago. A trooper, sent by the native governor to the district of Chandour to demand the payment of some revenue, was passing along the banks of the Goomtee, when he saw a large female wolf leave her den, followed by three whelps and a boy. The boy went on all-fours, and was on the best possible terms with the dam and her whelps; and the mother seemed to guard all four with equal care. They went down to the river and drank without perceiving the native, who sat upon his horse watching them. As soon as they were about to turn back, the trooper pushed on, intending to cut off and secure the boy; but the latter ran quite as fast as the whelps, and kept up easily with its foster-parent. Eventually they all re-entered the den. The trooper then assembled some people with pickaxes and attempted to dig them out. When they had dug some seven or eight feet into the bank, the wolf escaped with her cubs and the boy. They were pursued by the trooper, followed by the fastest young

men of the party on foot; the former headed them, and turned the boy back on to the men, who then captured him. They took him to the village and tried to make him speak, but could get no answer save an angry growl or snarl. He was some weeks at the village, and large crowds assembled each day to see him. On the approach of a grown-up person, he became alarmed, and tried to steal away; when, however, a child came near, he rushed at it with a fierce snarl and attempted to bite it. He rejected cooked meat with disgust; but when raw meat was offered, he seized it eagerly, put it under his paws like a dog, and ate it with evident relish. He would not let any person approach him while he was eating, but had no objection to a dog coming and sharing his food with him.

‘The lad was handed over to the Rajah of Hasanpore, and soon after was sent by him to Sultanpore, to Captain Nicholetts, the European officer commanding the first regiment of Oude local infantry. The latter made him over to the charge of his servants, who take great care of him, but can never get him to utter a syllable. He is inoffensive, except when teased (Captain Nicholetts says), and will then growl surlily at the person annoying him. He now eats almost anything thrown to him, but prefers raw flesh, which he devours greedily. A quilt stuffed with cotton was given to him, when the weather became very cold this season; but he tore it to pieces and ate a portion of it, cotton and all, with his food every day. He is very fond of bones, particularly uncooked ones; these he masticates apparently with as much ease as if they were meat. He continues to like dogs and jackals, and permits them to feed with him, if he happens to be eating when they approach.

‘Captain Nicholetts, in letters dated 14th and 19th September 1850, told me that the boy died in the latter end of August, and that he had never been seen to laugh or smile. He understood but little what was said, and appeared to take no notice of anything going on around him; nor did he form any attachments whatever. He never played with the numerous children around him, nor did he seem wishful to do so. When not hungry, he used to sit petting and stroking a *pariah* or vagrant dog, which he used to allow to feed out of the same dish with him. A short time before his death, Captain Nicholetts shot this dog, as he used to eat by far the greater part of the meat given to the boy, who in consequence was getting quite thin. The lad didn’t seem in the least to care for the death of his companion. He used signs when he wanted anything, and very few of them. When hungry, he pointed to his mouth. When his food was placed some distance from him, he used to run to it on all-fours; but at other times, not frequently, he would walk upright. He shunned human beings male and female, and would never willingly remain near one. To cold, heat, and rain he appeared alike indifferent, and seemed to care for nothing but eating. He was very quiet, and required no kind of restraint while he was with Captain Nicholetts’ servants—that is, for the space of about two years. He was never heard to utter a single word, till within a few minutes

of his death, when he put his hand to his head and said "it ached;" he then asked for some water, after drinking which, he died. This boy when caught was about ten years of age.'

JIM FLANNERTY'S GHOST.

'So you really believe in ghosts, Brian?' said I.

'Sure, your honour,' returned Brian with a grin, 'it's not for me to disbelieve what I've seen wid my own eyes.'

'Do you mean to say,' exclaims my friend Smith, 'that you have actually *seen* a ghost?'

'Faith, thin, an' it's myself saw one not two weeks ago, as plain as I see you at this minit. More by token, 'twas that same ghost got me my Mary, the purtiest girl in the whole village; not to spake ov an illigant cottage an' a thrifle ov gowld beside.'

'Come, that sounds interesting. Couldn't you give us a description of this obliging apparition?'

'Is it an account o' the ghost that ye're wantin'? Sure, an' I'll give it ye wid the greatest playsure in life, only ye'll not be repateing it to any livin' crature, or, faith, I'd niver hear the last ov it?'

We promise silence; and accordingly Brian, duly fortified with a glass of his favourite liquor, proceeds.

'Ye were maybe acquainted, gintlemen, wid ould Larry O'Donaghue?'

Unfortunately, we had never had that honour.

'An' small loss to ye, aither,' quoth Brian. 'But he was Mary's father, an' a purty father too; but that's naither here nor there. Well, I was a sort ov relation ov his; so, whin my mother died—she was a widdy—I wint to live wi' him an' Mary. She was a girl ov twelve thin, an' myself wasn't much older; but ye see I lived there seven years, an' by that time I was grown uncommon fond ov Mary; not that she'd ever listen to me, the crature, whin I wanted to tell her so; but still she didn't seem to mislike me. Well, I'd saved a thrifle, an' I was arnin' fair wages; so I'd jist made up my mind to ask Mary to be my wife, whin who should turn up but Jim Flannerty, bad cess to him! Now, Jim was a sort ov cousin ov ould O'Donaghue; an' he'd left his ship on sick-leave, though you would not have thowt it, to look at him, seein' he was as red as a carrot. Av coorse, he wor always in an' out ov the house, an' seemed mighty sthrudd wi' Mary, an' she wi' him. Well, the long an' the short ov it was that ould O'Donaghue sent me on a fool's errand to Dublin; an' whin I come back, Mary an' Flannerty wor engaged. Av coorse, I couldn't stay at home after that, so I jist wint away; an' I didn't come back for two years.

'Well, I returns one day, an' I finds ould O'Donaghue dead, an' Mary livin' in the cottage wid an' ould aunt. "Sure, it's myself, Mary," says I. "Arrah, thin, don't be onaisy!—An' it's

Mrs Flannerty that ye'll be now?" for I wanted to make sure, ye see. So thin it comes out that Jim Flannerty's not been heard of for a year an' more, an' the ship he sailed in's lost. Well, I was mighty glad to hear that Flannerty was out ov the way; though, av coorse, I was rale sorry for Mary, an' did my best to comfort her. However, she wouldn't noways believe that Jim was drowned. "Sure, but it's on some desert island that he is," says she; an' not all my talking could git that out ov her head.

'Well, one evenin' she an' I was walking along by the river, an' says I: "Mary mavourneen, will you be my wife, for I've loved you since the day I first set eyes on you?"

"Och, thin, Brian O'Brady," says she, "but I'm promised to Jim."

"Deed, thin, Mary alanna," says I, "but it's dead an' drowned that he is; so take me instead, an' it's not repenting it that ye'll be."

"I'll not believe that he's dead," says she, "till I see his ghost!"

'An' would ye believe it? That very minit I turns round, an' sees the ghost behind us!'

(I here interrupt Brian to ask for some description of the spectre.)

'Well, ye see, I didn't obsarve it very particular, for Mary av coorse screams an' drops down in a faint; but I jist remarked 'twas mortal ugly, an' flames was comin' out ov its mouth an' nose an' shootin' all over it.'

('Oh, come now!' breaks in Smith, but subsides on my looking at him reprovingly.)

'An' there was an awful snell ov sulphur an' burnin' about it,' continues Brian, 'though I wouldn't say it to Mary, for fear ov hurtin' her feelin's. Well, she soon comes round, an' says she: "Where's the ghost, Brian?"

"It's vanished," says I.

"An' was it Jim Flannerty's?" says she, very low.

"Av coorse it was," says I.

"Did he spake to ye, Brian, darlint?" says she.

"We had a few minits' conversation," says I.

"An' what was it ye were sayin', thin?"

"Troth, an' I'll tell you the whole," says I. "The ghost says to me—(I'll jist put my arm around ye, Mary, an' thin ye needn't be afraid)—the ghost says: "Brian O'Brady!" says he.

"Jim Flannerty," says I.

"You're an honest fellow," says he.

"Troth, ye're payin' me too great a compliment," says I, for I thowt it best to be civil, ye see.

"By no manes," says he. "Will you do me a favour?"

"Wid the greatest playsure in life," says I.

"I'm engaged to a young woman," says he—(Don't scream, Mary, darlint; I'm holdin' ye tight)—"an' present circumstances don't allow ov my marryin'; will you take her instead ov me?"

"Sure, it's proud an' glad that I'll be to do it," says I.—An' wi' that the ghost vanishes. "So, Mary, darlint, there's nought against our bein' married at once."

'Well, the long an' the short o' it is, we were married that week; an' it's as happy as the day is long that we are now.'

A roar of laughter from Smith greets the conclusion of Brian's narrative.

'What is the matter?' I inquire.

'Why, I was the ghost!' replies he.—'I say, Brian, did you ever hear of "luminous paint?"'

'Sure, thin, your honour, my own grandfather painted half the houses in K—; so it's few painted that-I haven't seen, seein' he used to make me mix them.'

'Well, if he covered the houses with luminous paint, it was rather a brilliant idea of his, though I don't suppose that it did actually occur to him!—You see this mixture here, Brian? Well, if it were dark, and I rubbed some of this on any object, that object would at once look bright and shining, and appear to give out light.'

'Sure, that's mighty clever, your honour,' says Brian.

'I had been trying for a long time,' continues Smith, 'to find out of what this paint is composed, and some evenings ago I succeeded in discovering the secret. I was so delighted with my success, that I did not wait to rub the stuff from my hands and face, but rushed down to my friend Professor Nichol's, to show him the result of my experiments. I remember I went along by the river; so you see that I must have been your "mortal ugly" ghost' [Smith is a handsome fellow, and a favourite with the ladies], 'who unconsciously did you such a good turn. The ghostly "conversation" existed, I presume, only in your imagination.'

'Sure, didn't I think all the time that 'twas mighty like yourself, Mr Smith!' says Brian drily.

'Then why did you tell us that it was Flannerty?' I inquire.

'Arrah, thin, but Jim Flannerty wor uncommon like your honour's friend, as you'd see if he were standin' here this minit; so why shouldn't their ghosts be alike too?' And Brian took his departure, leaving us laughing over his ready wit and inventive genius.

OCCASIONAL NOTE.

A STRANGE STORY OF RETRIBUTION IN ANIMAL LIFE.

A CORONER'S inquest was recently held in London upon the dead body of a man who had been killed by an elephant belonging to Mr Myers, circus proprietor. The elephant in question was a female, and was known by the name of 'Blind Bill,' because she was stone-blind. The elephant was in general a perfectly quiet animal; but had nourished a prejudice against the man who fell a victim to its revenge. Eight months before the fatal occurrence, and while the circus company was performing at Reading, the deceased, who was then a hawker in that town, was one day watching the elephants, when 'Blind Bill' put her trunk into one of his baskets and ate all his vegetables. Becoming incensed at his loss and the laughter of the bystanders, the man pulled out his penknife and cruelly stabbed the elephant in the trunk. This was the beginning of an ill-will between the man and the quadruped; for the man having afterwards got employment with the company, was attacked one morning by the elephant and crushed to death against a wall.

But the most remarkable part of the elephant's

story is still to be mentioned. This refers to the manner in which the animal lost its eyesight, and was told by Mr Myers in his evidence at the above inquest. He said he had had the elephant for twenty years, and during the whole of that period she had always been of a singularly mild disposition, unless provoked. For instance, about thirteen years ago, a groom in his employment put out one of her eyes with a pitchfork; for which act of diabolical cruelty the man was dismissed. About twelve months later the animal lost the sight of the other eye, and since that time had been stone-blind. Some two years afterwards, Mr Myers's company was performing in Jersey, and while there, the groom in question came into the stable in which the elephant was, and, slapping her on the side, said: 'This is the old brute who got me dismissed.' On hearing the man's voice, the elephant pushed him up against the wall, and so injured his head and eyes that ever since that time the man had been what is termed *cross-eyed*. The coroner, Sir John Humphreys, in addressing the jury, rightly observed that this incident, as related by Mr Myers, was a curious one, and was certainly a just retribution upon the groom.

THE WEANING OF THE LAMBS.

HERE, on the trunk of this uprooted pine,
Sole barren thing amid the summer's green,
I'll rest awhile, and let my spirit take
Its fill of anguish. Oh, to heart like mine,
Deep shadowed with the gloom of present grief,
How human-like, how full of pity, come
The long loud wailings of the lambs that bleat
Their sorrows in a crowd on yonder hill!
How painfully along the twilight air
Swells the deep dirge pathetic! All the wood
Is listening breathless to the mournful sound.
The very mists with which sad Evening veils
The dewy earth, and clouds the blue serene,
Seem struck to stillness in their phantom-shapes,
And cling about the steep of yon tall crag
Like mourners round the couch they cannot ease.
The soft warm shower that but an hour ago
Suffused the vale, and cheered its drooping life,
Has left bright droplets on the shadowy wood,
And every leaf is glistening like an eye
Of silent sorrow for the fleecy fold
That give such sad complainings to the night.

O creatures, gentlest of all gentle things!
I cannot linger here, and, lingering, list
The expressive voice of inarticulate grief
Rising and falling with the ebb and flow
Of your unspoken sorrow, and not feel
Some natural throes of sympathy pain.
I would not seek to shut—were't in my power—
'Gainst any creature on God's blessed earth,
Struck down by woe, the sluices of my heart:
Nay, rather would I fling the floodgates wide,
To let my pity mingle with your grief,
And from the confluence of the sacred tides,
Like palm-tree by the desert's lonely spring,
Draw secret nourishment and hidden strength.

EUROPEAN LIFE IN EGYPT.

IN Cairo, Alexandria, Port Said, Suez, and Ismailia, there was before the recent events such a large proportion of Europeans to the native population, that a few words in regard to the particular class of Europeans who inhabited these towns, their habits and modes of life, may not be without interest at the present time.

Cairo was to Alexandria what the West End is to the City of London—to some extent what Paris is to Marseilles. It was a city of pleasure, and for this reason attracted a class of Europeans who are not to be found in other parts of Egypt. And its position in the centre of so much that is ancient and interesting—the Pyramids, the mosques, the tombs, the bazaars, Heliopolis and Sakkarah, the Boulak Museum, &c.—and its admirable situation as a starting-point for the journey up the Nile, all gave a distinct character to its European population. For the trades-people depended almost entirely upon the visitors, and the season extended from November to April.

There is, or rather was, a coterie formed of the residents in Cairo, chiefly composed of the Europeans belonging to the various governmental departments, and their families. These, recruited by the arrival of friends, or others bringing introductions from home, formed the 'society' of Cairo. There was plenty of lawn-tennis of an afternoon at the house of the popular Consul-general, Sir Edward Malet. Then there were dances and dinners, and a fair second-rate opera company, and returns of hospitality at Shepherd's Hotel, where theatricals and fancy balls would be arranged, or excursions planned, or flirtations carried on. Disquieting rumours were meanwhile afloat, as early as in March last, as to a contemplated massacre of Europeans, but the idea was scouted; nor was there anything in the attitude of the natives to support the rumour. During the Hadji, or procession bringing the holy carpet from Mecca, Europeans felt some little doubt as to their possible treatment by the

mob, excited by religious enthusiasm, and by the presence of some thousands of soldiers, who were known to be unfriendly; but there were only a few isolated instances of disturbance, which were as likely to have proceeded from one side as the other.

The Europeans engaged in commerce were chiefly Greeks or Levantines, with a fair sprinkling of Italians, Germans, and Maltese. It does not seem to be generally known that throughout Egypt, Italian is the only European language in common use. You may go into dozens of good shops in Cairo where French is not understood. All official notices are in Arabic and Italian. The hours of business are in the morning as on the continent, and from twelve to three nothing is done. The European Cairene of commerce spends a good deal of his time at the café smoking his narghileh and drinking coffee during the day, ready for any business that he may be called to, but not seeking it; and in the evening he likes to listen to the hideous Arabic music, to gamble at roulette or to dice with the hawkers who pass from café to café, dice-box in hand, to play you for their wares—ducks and fowls, scents and soaps, brushes and combs and writing-paper, and the like.

Alexandria was the Marseilles of the East, commercially speaking, and it had finer and better paved streets, finer houses and shops, and a drive by the Promenade and the Mahmoudieh Canal, fringed by more beautiful and luxurious gardens and villas than are to be found in Cairo. Its business character was at once apparent. The crowds of well-dressed men about the Bourse; the activity and hurry in the surrounding streets; the loaded carts at the warehouse doors; the brass plates of companies, and bankers, and merchants; the rushing hither and thither of the chevasses or messengers in their Syrian dresses; the Arab porters, with legs bent under the enormous weights they carried on their backs—all spoke of a community full of the life of business. The talk was of bales and cargoes, and consignments and exchanges; and men adjourned

to the famous café in the *Rue de la Bourse* to clench a bargain after the sociable fashion of Manchester or Liverpool. The wealthy merchants lived out in the suburb of Ramleh, about four miles from the town; and when anything particular in the form of amusement was to take place in Alexandria, the play-bills informed the public that trains would be run to Ramleh so many minutes after the performance was over, as they might do if Ramleh were a suburb of Cottonopolis.

The European young man of business—English, French, German, Italian, or Greek—was like his counterpart in our own large commercial centres, somewhat dressy and given to jewellery and rather fast equipages; but the English had their cricket, and rowing, and athletic clubs into the bargain. Then the young men had the entrée of the houses with which they were connected, and the society of the families. There were two theatres; a very fair band at the Café Paradiso, formed of fair Triestines and Bohémiennes; *trente et quarante*, if one were so disposed; capital beer at the brasseries—notably Fink's; and oysters to be had for a piastre (twopence-halfpenny) a dozen. The lower class of Europeans in Alexandria were numerically as strong and morally perhaps worse than the Arabs in the town. In the summer, all Europeans who could, came from the interior to Alexandria for bathing.

Port Said is an overcrowded little coaling-station that was called into existence by the Suez Canal. Its growth has been something marvellous in the last ten years, and, besides coal, it carries on a very brisk trade in stores of all kinds with the steamers passing through the Canal. The respectable portion of the European inhabitants, bearing a very small proportion to the disreputable, have few resources out of themselves. The main street is scarcely fit for decent people to walk in after sundown, after which time the side streets and the Arab quarter at the back of the town send forth about as pretty a mixture of Levantine and Arab blackguardism as is to be found anywhere in the world. There is no redeeming feature in this miniature pandemonium, with its gambling-houses, grog-shops, and general immorality; and the low-class Europeans, chiefly from the Greek Archipelago and the Levant, are a good deal worse than the native population. And when a khamseen wind is blowing, and Port Said is enveloped in a mist of coal-dust and sand, it is not surprising that even the better class of inhabitants should rush to the billiard-tables of the *Palatine*, and the green cloth of *El Dorado*, to get rid of the killing depression of the place.

It is pleasant to turn from the western port of the Suez Canal to the little town of Ismailia. The post-boat runs daily by the Canal, carrying mails and passengers, and takes about six hours for the journey. Ismailia is a veritable oasis in the desert waste between the Mediterranean and the Red Sea. By a long avenue shaded by acacia trees, you pass from the landing-stage, cross the Freshwater Canal, and reach the public gardens, which are laid out with great taste, with a fountain sparkling in the middle. The streets of the town radiate from this centre. There are trees everywhere, and it is the cleanest town in Egypt. It is altogether French; there are no shops, except at the Arab bazaar, about half a mile

away across the sand. There is an hotel by the landing-place to which salt-water baths are attached; and a very comfortable and homely hotel near the gardens, where the few Europeans there are—nearly all French—take breakfast and dinner at the table d'hôte. They are chiefly officials connected with the Suez Canal, with a few merchants and clerks engaged in the cotton trade with Zagazig and Mansourah. M. Lesseps has a villa here which he occasionally visits. There is a deadly quiet about Ismailia; and empty houses and empty offices, the absence of shops and cafés, together with its separation (characteristically French!) by half a mile from the Arab quarter, give the town a deserted appearance, which, however, is not without its charm in a country where huddling together, and the importunities of begging natives, are notable nuisances. A few little shoe-blacks, who are ready to show you the Khedive's palace or the other lions, or to brush your boots, alone pester you for backsheesh, rather as a matter of course than with any earnestness. They are amusing little ragamuffins, with none of the sharpness and vice of the little town *gamins* of Egypt. Ismailia, then, may be described as containing a small French colony, living their life, after the manner of Frenchmen abroad, very much as they would in their own country, and having as little to do with the natives as they conveniently can. A line of rail runs from Ismailia to Nefisa on the main line between Suez and Cairo, so that it will in all likelihood become a place of some importance in the current course of events in Egypt.

Suez, with the most delightful climate in Egypt, with neither the 'damps' of Alexandria nor the dust of Cairo, might, with a particle of the taste and discrimination shown by the French at Ismailia, have been made a perfect garden. The soil is most productive, covered by a mere coating of sand; and the excellence of the fruits and vegetables that are so sparsely cultivated here, are well known. Had the docks been made nearer the town—not, it has been thought, an impossible feat—Suez might have been made nearly as busy a seaport as Port Said; and from the charm of its climate, combining the purity of the desert air and the saltiness of the Red Sea, it would doubtless have drawn many families to 'winter' there, who went to Cairo. But with the town some two miles away from the docks, business confined to the quay and the custom-house, no amusements, a generally tumble-down look, and no trace of an attempt to brighten or beautify it, it is not surprising that Suez should usually be characterised as a 'wretched hole.' The European society in Suez was composed of the agents and officials of the Canal, the large steam companies, the post, the telegraph, and various offices of the Egyptian government, and for the most part English, French, and Italian. An excursion to the Atakah Mountains, or to Moses' Wells across the Gulf, fishing in the Red Sea, shooting duck and quail in the winter, strolling up to the Freshwater Canal, donkey-riding to the docks or Terra Pleina, a sail down the Gulf, occasionally lawn-tennis, a dance, or some private theatricals, formed the sum of the amusements in Suez. As in most small communities, however, there was little 'coherence'

amongst the families, and the only really universal sentiment seemed to be that of lamenting the fate that compelled a residence in such a spot.

From February to April, the coming and going of travellers for the desert journey to Mount Sinai or Petra, and sportsmen for the Soudan or Abyssinia, would enliven the courtyard of the hotel; swarthy Bedouins in charge of the caravans, with their camels; dragomans swaggering and armed to the teeth; monkeys, jackals, and other strange beasts and birds clattering and screaming; horns, and skins, and tusks, and other spoils of the chase; spears, and daggers, and shields, and clubs, and other implements of barbarous warfare, all scattered about amongst the various *impedimenta*—tent-poles, ropes, chests, saddles, guns, &c.—of these excursions. There was a reading-room and bar off the courtyard, and here young Suez would come to see the newspapers, and listen to stories of flood and field, or hear how things fared east or west, as passengers from homeward or outward bound vessels turned up from a saunter ashore to slake their thirst. The relations between Europeans and Arabs were not always of a friendly character, and occasionally scrimmages took place. The Arabs are a truculent lot, many of them with Bedouin blood in them, and their predatory instincts have rendered them in many cases excessively troublesome to Europeans.

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

CHAPTER XXXVII.—‘YOU DIDN’T ANSWER THE TWO LETTERS I SENT YOU AT THE GRAND HOTEL.’

A PICNIC party had assembled on Welbeck Head on a splendid morning in the early days of June. The picnic party leaving itself free to ramble over the sterner picturesqueness of the headland, naturally chose Welbeck Hollow to take luncheon in. Perhaps the Hollow looked its best to an artist’s eye in autumn, when the foliage of its trees had grown mellow with the tints of the dying year; but on this particular June morning it was very lovely; and he or she who demanded a fitter place for open-air delight, would have been hard to please indeed. For the whole broad expanse of blue above the headland absolutely seemed to laugh; the air was warm, the herbage dry, and the foliage in the first flush of its summer beauty. The tears of the imprisoned princess sparkled in the sunlight, and the little stream they made bubbled away through its channel of lichen-covered rock with a voice of perpetual music.

At this gathering, Gerard played host, and his mother hostess; and there were two or three score of people there, mostly young, and nearly all bent on enjoying themselves, as their time of life and the splendid weather befitted. Rising against the belt of trees, in contrast to their green, were two or three tents of striped pink and white. The girls were gaily dressed, and moved about merrily here and there, making pretty, shifting pictures, on which any eye but that of a cynic born might rest well pleased. I have said before—and I feel safe in repeating it—that the average of beauty in these favoured

islands is high. Most of the young ladies were pretty, and some one or two downright beautiful. But from amongst them all, had Paris been there to play judge again, Constance would have carried off the apple. Now, men are so constituted, that a beautiful woman in their eyes always looks as though she were something more than beautiful. Rosy cheek, coral lip, starlike eyes, all these things, charming and admirable of themselves, reveal to the gaze of the male creature inward and spiritual beauties which the fair proprietress of cheek, lip, and eye may be miles away from. ‘Sure, nothing ill can dwell in such a temple?’ My love-stricken Amandus, I know not. I am myself all too susceptible to the charms which have entrapped you. I am not stern enough to act as censor in such a matter; but the sweet eyes may not mean constancy, nor the sweet lips good temper. Go your ways, Amandus; wed the lady if she will, and be as happy as you may. The chances are she is worth twenty of you; but beware of taking her for an angel because she looks like one. Beware? Whoever did beware in such a case? Run away, Amandus, and be happy. Chloe awaits you; and though I were wiser than I am, why should you care to listen? Perhaps in a year’s time you may be able to write your own sermons.

It was not any more than lover-like folly in Gerard to set a name and a virtue together. Constance and constancy ran always together in his mind. Always the recipient receives according to his own measure. The tunes which were familiar to you in childhood move you far more than more beautiful airs since listened to, because you put your own memories and your own emotions into them. The worshipper creates his own deity. Venus, and other forms of beauty for old Greece; fetich, bits of rag or stick for modern Ashantee or Ujiji. And it is so with love. Your wisest lover is your noblest man. And if you meet this by telling me that Arthur marries Guinevere, that John Milton is three times unlucky, that Samson falls into the hands of Delilah, you have said nothing unanswerable. The blameless king worshipped purity though he knelt at a false shrine. I have no doubt that one of the Mrs Miltons stood for Eve, and gave us an immortal picture, to which she was no more like than I to Hercules. The big-limbed practical jester of old days had so frank and honest a foolish heart that he believed in Delilah when she had twice betrayed him. The true lover sees his own possible ideal best actually existent in the woman he loves, and before that he bows down and worships. You can always deceive loyalty, because it is so simple-minded where it loves. It is harder to deceive mean-eyed suspicion, that peers everywhere. And the loyal-hearted Gerard had no doubts. That other men admired Constance, was very likely; men must needs admire transcendent beauty when they see it, and there was no jealousy in him, any more than in Othello before Iago transformed him.

As host, Gerard had duties in which he was proud to be associated with Constance if she chose the association; but when she rambled away, the duties held him, and he had no complaint against her. He no more suspected Constance than he

suspected himself, because she was his very ideal possible best, and at his poorest he was loyal and honest. It clouded his sunshine a little when he missed her; he had otherwise been no lover. But he would see her again by-and-by, and meantime she was probably enjoying herself, and would be back again shortly. She did not come back so shortly as he had hoped; and after a while, he appointed a lieutenant, and set out to hunt for her, and naturally went the wrong way.

Constance, with head drooping just a little, had walked away from the white and pink striped tents, and winding up through umbrageous foliage along a path of gray rock, with green and golden lichen glinting on it here and there, had come out upon a sort of platform, which commanded a view of the whole arena of pleasure. Her cheek was somewhat paler and less full than it should have been, and her eyes were rather soft than lustrous. For a moment she paused, and through the branches which concealed her, looked down upon the Hollow, and then turned and went upward towards the hoary summit of the great headland. Life chirruped and hummed and rustled in the air and in the wood on either side. Gray rabbits frolicked across the path; the squirrel sat up impudently in the undergrowth almost at her very feet, and cracked a nut from his winter hoard; the insect tribes wheeled round and round in dizzy circles, as if drunk with sunlight; and the wanton birds sang until the leafy covert echoed to their music. The very ground she trod on was embroidered gold and green in shifting patterns, as the branches waved and the changing sunbeams flickered. Lost in her own thoughts, she wandered on until the bare shoulder of the headland heaved up from the frondage and the sea lay in view. There, in the shelter of a great boulder, washed smooth by prehistoric waters, and rolled there by some unknown agency, she sat down, and trailing her parasol point along the surface of the granite, made fanciful patterns of no meaning. At times, a faint, faint sound travelled up to where she sat from the picnic party, half a mile away. Voices called to each other in the woods. The sea, far below, made a solemn murmur. A footstep startled her. She looked up, and there stood Val Strange before her, not fifty yards distant.

There was no path up here on the bare top of the headland; but Val stood in a sort of gully, with vast irregular stones piled upon each other on each side of him; and this natural passage if pursued would have led him to the spot upon which Constance sat. But seeing her in time, and believing himself to be unobserved by her, he turned, shot behind a great boulder, and by devious ways climbed to the top of the right-hand ridge, concealing himself from her gaze all the way. He had no doubt that Gerard was with her, and was anxious to escape unseen. So he crawled stealthily from shelter to shelter, and in brief time came on a line with her, and from behind a rock peeped down. Then he saw that she was quite alone, and repented him that he had hidden; he could at least have lifted his hat to her and have seen her face. A thrice-rejected lover had so much right in the world, if fortune should favour him. For a minute or two he watched; but she was turned away from him, and he could see nothing of her face. He made a flank movement, and secured a sight of her

whole figure, and then he saw that she was not only alone, but that she was weeping. She had seen that he saw her, and she had marked him as he made away. *Hinc illæ lachrymæ.* Val was ignorant; but her loneliness encouraged him, her distress touched him, his passion drew him to her, and in short he scrambled down the rocks and made the best of his way towards her.

She heard him coming; by some electric message of the heart, she knew that it was his footstep, and not that of any straying picnicker; and with feminine guile, she dried her tears, threw into the slope of her shoulders a sort of pensive air of landscape observation, and feigned to be unconscious of the intrusion. As he came nearer, her apparent ignorance of his presence chilled and repelled him, and he felt that it would have been far easier to have approached straightforwardly, since chance apparently so willed it, and have gone his way. He was half-inclined to return, and stood still for a second or two. The pause warned her. She had cried when he had seemed to avoid her; yet almost in a minute she had told herself it was best he should go by; and yet, and yet, and yet again, when she heard his approaching footstep, her heart rejoiced, and now she could not bear that he should go. With a fine pretence of negligence and accident, she turned, and seeing him standing there, she arose, as if with a little start of surprise, and holding forth her hand, advanced a step or two to meet him. Val raised his hat, and stepping forward, took the proffered hand.

'I had not thought you were at the picnic, Mr Strange.'

'No,' said Val. 'I had an invitation to be there; but—I did not expect to be in England at this time, and'— He did not finish what he had to say, if indeed he had decided to say anything; but looking at her face, he saw that she seemed happy, in spite of his suspicion that she had been weeping a minute or two back. Her eyes sparkled, her cheek was flushed, and she was all grace and beauty. Val would have been an egotist indeed if he had set down all this to his own return. Lovers do not torture themselves in real life so much as they do in novels, where, as you know, a poor author must fill up his three volumes somehow; but it is beyond doubt that they are a stupid and a self-torturing race. 'I was an ass to think she was crying,' said Val to himself. 'She is happy enough. I suppose she loves the fellow after all.'

'Indeed,' said Constance, lightly and brightly enough. 'And where did you think of going?'

'My yacht is lying in Quadross Bay,' said Val, 'and I thought of sailing somewhere, last Wednesday.'

'A vague sort of destination, isn't it?' said Constance, smiling. 'Somewhere?'

'Yes,' said Val moodily; 'vague enough.' He had not expected to meet her and talk in this off-hand way with her. 'She means to be friendly, I suppose,' he thought, 'and has the sense to let bygones be bygones.'

'Shall we talk nothing but commonplace?' thought Constance. 'Has my silence set up an unbreakable barrier?' Silence was too terrible, and she must say something. 'The Hollow is a lovely place for a picnic,' she said. (Anything does for small-talk.)

Val supposed the Hollow was well enough. 'I don't seem to care much for scenery lately,' said poor Val vacuously.

'No?' said Constance.

'No,' said Val. Then ensued a conversational break-down, and the silence became extremely awkward. The two hearts could not whisper to each other through the barrier. Constance made a pretence of surveying the seascape. Val, being a man, had less tact, and was still less an actor, of course. In love's arena, woman stands on her native heath. The male creature is only a wanderer there, and feels himself lost. But though she kept more outward and inward self-possession at the moment than he did, she felt the continued quiet weigh so heavily, that she was obliged to break it, and in her anxiety to say something, proposed the last thing she desired. 'Shall we join the others, Mr Strange, since you are here, after all?'

'No,' said Val; 'I don't care about it, thank you.' Then he made a desperate plunge. 'It's very kind of you to meet me in this way. It's the wisest way, no doubt. But I'm not quite equal to it—yet. You didn't answer the two letters I sent you at the Grand Hotel, and I've seen ever since that it was a presumptuous and unmanly thing to write them. But it's not my fault that you're the loveliest woman in the world, and'—

'Letters?' cried Constance. She never meant to deny the truth; but she had only received one, and she was eager to exculpate herself from the graver charge of cruelty and neglect he brought against her when he spoke of two.

'Didn't you get them?' cried Val, half wild with a sudden rush of new hope. He gave her no time for answer. 'Don't you know why I went away from England? Don't you know that I was ignorant of all that happened during my absence, until I came back and found those papers?' The mere mention of the papers brought Gerard to his mind, and checked him. But he broke past the thought, and went on all the more impetuously. 'And when I found that you were free again, I only waited to give Gerard a fair chance, and followed you at once. I wrote to you twice, and had no answer; and I took your silence as the strongest negative. It seemed cruel—I can't say I didn't think it cruel. By what terrible mischance they missed you, I can't guess. But—would you have left me in such bitter suspense had you received them? Would you have been so disdainful and so cold?'

It seemed now, as he spoke, so hard a thing to have left unanswered the one she had received, that she did not dare to confess that she had read it.

'I am sorry if I seemed discourteous,' she said in answer; 'I am sorry if you suffered.'

'If I suffered?' cried Val. 'When I thought you disdained my presumption too much to answer by a word! When I have thought so for a month past!'

'I am sorry,' she faltered again.

'Constance!' said Val. 'Heaven knows, I did not seek this meeting!' That was true enough, in a sense; but he had hoped for it, and the nebulous fancy that it might come had led him to the headland. 'But since Fate has thrown me in your way, I will not resist her bidding.

If you don't care for me, and I go on persecuting you in this way, I'm the most horrible cad alive! But I can't help taking the risk. Tell me that you don't care for me at all; tell me that you are happy, and I will go away, and never trouble you again!' How could she tell him to go, when her heart yearned so over him? Yet she made a little struggle still.

'I am very sorry to give you pain,' she murmured.

'Tell me the plain truth,' said Val masterfully. 'If you are happy, send me away. If you care for me, I will never give you up. I will hold you against the world. Tell me the plain truth, and let me go.'

'Mr Strange,' she answered falteringly, 'our paths are ordered for us, and they are wide apart.'

'Not unless you order that it shall be so,' he said doggedly. 'You shall give me a plain answer.'

She had no answer ready. During the whole of their colloquy she had scarcely dared to look at him, and since the talk had become earnest, their eyes had not met once. But now her gaze rose slowly to his face, and though her eyes met his for but a second and were dropped again, the longing in them smote him through and through, and he seized her unresisting hands. 'You love me!' he panted—'you love me!'

What answer could she give him? It was true. Her bosom began to heave, and her cheeks grew pale, and one or two great tears rolled down them.

'Shall we part?' he asked her fiercely. 'Will you wreck two lives? No!' And he cast his arms about her in a mad defiance and strained her to his breast. She was conquered, and she knew it, and he knew it. Yet even then, in the first wild joy of certainty, the world's probable verdict arose before him. Well, he defied it. It was surely better to spoil one life than three—especially when the life to be spoiled was not his, but another's.

But even whilst they stood there, a voice reached their ears, crying 'Constance!' Val released her, and they stood with pale faces looking at each other. The voice was Gerard's, and was not more than a couple of hundred yards away. It was not loud, but modulated a little, as if the lover did not choose altogether to cry out her name, and felt a certain shyness in the act; but in the dead stillness of the summer air they heard it clearly. Then they heard the searcher try another tack. He began to sing, and they knew that *La donna e mobile* was meant to guide the wanderer towards him.

'Go!' said Constance. 'Do not let him find us here.'

'You love me?' questioned Val, half fiercely still.

'Yes,' she answered. 'Go.'

'Come with me,' he whispered; and treading like a thief, he led her round the great boulder under which they had been standing all this time, and by a zigzag way upwards, keeping shelter; and then by a zigzag way downwards, until she saw the Hollow below, through the waving branches of the trees. The voice grew more and more distant as it sang along the little rocky pass.

'Leave me now,' whispered Constance. 'Let me go.'

'You love me? Tell me that you love me.'

'Yes. Let me go.'

'You will write to me. We shall meet soon?'

'Yes.' And she was gone, pausing a while in the wood to compose herself. A moment or two later, she walked serene into the swarded Hollow, and came round the boulder which held down the imprisoned princess of the local fairy tale.

'Where have you been, my dear?' asked motherly Mrs Lumby. 'Gerard has gone away to look for you. Mr Lumby has been asking for you.' And the girl followed Gerard's mother to one of the striped tents where in an arm-chair sat the head of the great House in the City, and smiled and nodded at her in a fashion somewhat childish. It seemed scarcely likely that he would ever recover his old self; but he had mended wonderfully since the beginning of the brighter weather, and knew the faces of his friends. The old man was very fond of Constance, and was never happier than when she and Gerard were near him. He had contrived to make out in a dim way that the great House was not ruined after all; but his comprehension of affairs was like that of a child, and as yet pathetically incomplete. Milly sat smilingly on one side of him, and had been with him all morning, prattling to him of the things he could understand. As she greeted the wrecked old man, a great pang passed through Constance's heart, and she kissed him with tears in her eyes. Motherly Mrs Lumby took this for pity for Gerard's father, born of the girl's love for Gerard, and she kissed Constance warmly; and the old man smiled his heart-breaking childish smile, and said: 'I am glad you are fond of each other.' All this made the position terrible for Constance.

Val, having parted from her, turned his back upon the Hollow, and having wandered a little way, came to a heathery spot, in which he cast himself down and tried to think. His fierce joy had already faded, and he began to face the situation with a sense of fear. Popular opinion was something to him, and he knew that it would be against him. This, of course, gave him no actual pause, but it cooled his triumph. And then there was Gerard, and his stricken father. Val knew how fond the old man had grown of Constance; and he was not a brute, and felt something of the pain he would inflict upon those who had already so keenly suffered. Then Reginald's tongue had lashed Val's foibles once or twice, and he respected the staunch little man's opinion of him, and dreaded his disdain. And one thing was certain. If Val knew anything of human character—and he prided himself, as most men do, on knowing a good deal—he would have a bitter enemy in the man he was robbing. Against Gerard's grief, or possible grief, of course Val's own egotism shielded him. It was better that Gerard should be wounded, than that he himself should. *Cela va sans dire*. Let us not be bitter. We have all thought so in our day, over this matter or that; and if we have never stolen another man's lover from him, why, that may not have been our particular temptation. And perhaps some of us have done, or

attempted even that. Most of us live in glass houses, though we build them of different patterns.

Mechanically, as he lay there in his heathery nook, Val drew out a cigar, struck a fusee, and began to smoke. Gerard's wanderings brought him that way in the course of some five minutes, and the scent of the fusee still lingering heavily on the air, he beat round for the smoker. As he came, he chanted in a deep and jovial bass:

Shepherds, tell me, tell me

Have you seen—have you seen my Celia pass this way?

Cheeks lily white, lips rosy red—

and the rest of it. There was no touch of fear or suspicion in his mind; and the bright air, the quivering sunflecks, the birds' glad chorale, the dancing leaves, were each and all ministers of pleasure to him. So he threw back his shoulders and opened his chest, and rolled out the air of the glee in a mellow roar like that of an amiable tuneful lion, and came bursting through the boughs on the little clear space where Val lay. The smoker made no effort to escape him this time, and knowing, by the sudden cessation of Gerard's voice, that he was seen, he said, without turning round: 'That you, Lumby?'

'Why, Val, old chum!' cried Gerard joyously, 'I thought you were on the bounding deep, aboard the *Mew's-wing*. What brings you here, you ancient mariner—playing at Diogenes?'

'The master of the confounded craft has got the pip, or something of the sort,' growled Val.

Gerard came and sat beside him, and demanded a cigar. Val supplied him, and lay silent. Here was the first difficulty. If the action he had begun should be carried out—and he had no dream of relinquishing it—Gerard should know. Honour bade, that at least, at least he should tell his rival of his intent, and let him know that his happiness was threatened. But looking at his rival's happy face, he felt too much a coward so to wound him. 'It's like stabbing a sleeping man,' he thought, with an awful inward spasm of reluctance, 'to steal her from him without warning him. I must give him a chance of an appeal. My only possible atonement to him is to tell him openly that he has lost her, and will have to surrender her. If I do that, I can face him. If I don't do it, I am a dastard.' But in spite of the fact that he could speak thus strongly to himself, he could not bring his tongue to speak one word to Gerard.

'Are you come to join our picnic, ancient mariner?' asked Gerard.

'No,' said Val. 'I came out by mere chance for a stroll, and wandered farther than I meant. I have business to see to; and, by the way'—drawing out his watch and looking at it—'I shall be late already.'

'I must go, too,' said Gerard, bethinking him again of Constance. 'Ta-ta, if you won't come. See you again soon, eh? You'll dance at the wedding on the first of July, won't you?'—Val hid his face and searched his pockets.—'I shall count on you, you know. Good-bye.'

'All right,' cried Val. He could have shot himself for his own baseness. 'Good-bye.'

Gerard was gone, and began his chant again between the whiffs of his cigar: 'Shepherds, tell me, tell me.' The voice died away in the woods; and Val cast himself upon the heather once more. 'Miserable coward!' he cried.

The Primrose Way was scarcely pleasant travelling even now.

REMINISCENCES OF THE MINOR STAGE.

BY AN OLD STAGER.

PART II.*

At the close of a well-remembered day in the early autumn of 1872, I made a pilgrimage to the little village of Chiswick, on the Thames. Living in a garrison town some miles above, where there is noise enough and to spare, I could not fail to be struck with its extreme quietude, considering its close proximity to the busy hive of London. It wears a remote if not antiquated air, and fits pleasantly enough into a preconceived notion of a secluded country hamlet of a century and a half ago. This was my impression, as I leisurely bent my footsteps round the base of the gray old church tower into the adjoining 'God's-acre,' green and sequestered; dotted here and there with flowers, carefully tended by loving hands; and within sound of the long lazy plash of the flowing river at its side. I looked around me curiously to discover the whereabouts of certain forgotten and unforgotten worthies, said to lie within its precincts; nor was my search unrewarded. The Earl of Macartney, so well known by his Embassy to China, lies here; as also does Dr Rose, a ponderous if not profound writer in the days when brave Samuel Johnson was king and lawgiver in the literary world of England. Arthur Murphy the dramatist contributes a long and somewhat laboured inscription to his friend's merits and memory. The 'battle of life' has no longer any terrors for the overworked brain of Dr Griffiths, a man of mark in his day as editor of the *Monthly Review*; and James Ralph rests here, quietly oblivious of Pope's stinging satire:

Silence, ye wolves! while Ralph to Cynthia howls,
And makes night hideous; answer him, ye owls!

Holland, a meritorious actor in Garrick's later period, sleeps peacefully in the immediate neighbourhood of Philip Loutherbourg, an artist of some repute, more especially as a scene-painter at Drury Lane. The fiery petulance of Ugo Foscolo lies hushed now under a marble slab recording the dates of his birth and death. But the crowning glory of this consecrated rood of earth is the tomb of William Hogarth, a spirit quickened by the immortals to work out their own divine ends.

'I pray you pardon me,' gentle 'companions of my solitude,' for this apparent digression. At present, I am somewhat *distract*. The theatre and all its belongings are miles away; the floats are unlit, the big drum is nursing his last new baby, and little Tom Nokes—our extra trombone, if you please—is tending his sick wife; even the gasman is conspicuous by his absence; for the simple reason that there is no 'house' to-night. I am on the 'rampage.' I am revelling to my heart's content in the bright sunny atmosphere; the sweet-scented air, blowing gently from the

south, lifts my hair, as looking across the river, I recall some boyish memories of my old school-days, doubly endeared to me now, since one by one 'our fellows' have gone on their destined way and been seen no more.

Whilst I have thus been 'chewing the cud of sweet and bitter fancies,' my old dog, tired with his unaccustomed lengthy ramble, has fallen asleep on a diminutive green mound at my feet. I turn curiously to reconnoitre, and am rewarded by the discovery of one of the prettiest little inns it has ever been my fortune to light upon. Sheltered 'by the spreading branches of a chestnut tree,' its bright face glows with splashes of colour; flowers are gleaming from door-sill to roof-tree; every door and window is thrown wide open to catch the drowsy air as it creeps up languidly from the gleaming Thames. I agree with my friend Richard Swiveller, and exclaim aloud that a 'modest quencher' is necessary. Trot—like a sensible dog as he is—leaps up approvingly, pretends to be wide awake with all his might, and makes a feeble attempt at gamboling, which soon subsides as we arrive at the welcome sign of *The Roasted Pippin*. Pippins and ale! The connection is at once both natural and appropriate. A foaming tankard of the real Chiswick brew is placed at my elbow by the good-natured hostess, who also supplies Trot, at his earnest, albeit noisy solicitation, with his favourite Abernethy biscuit. A brier-root is extracted from an inner pocket, lightly filled with the mildest tobacco, and Trot and I cogitate. After a time, Trot affects anxiety, and we pursue our way. Hard by the church is a long narrow lane, branching off in the direction of the Duke of Devonshire's villa, Chiswick House. Originally devoted to the purposes of market-gardening, the ground hereabouts has been partially inclosed—say within the last fifty years—by the enterprising and speculative builder, to meet the exigencies of an increasing population. At the extreme end of this lane, on the left-hand side, stands Hogarth's house and garden, surrounded by a wall of some extent. It is an old-fashioned, red-brick building, of moderate size; but scarcely to be seen from the roadway, by reason of its lower level, and the clustering trees which encompass it.

The present occupier of this house, beneath whose shadow I am standing, is an old friend, was the hero of my boyhood, the *preux chevalier* of my youth, and the intelligent and industrious actor always. His card lies before me now as I write, and the name inscribed thereon is Mr N. T. Hicks. To playgoers thirty years since, the name of this gentleman will be very familiar indeed. As a leading actor on the Surrey side of the water, he was as well known and as popular as any of his theatrical brethren in the West. Habituated from his earliest years to the practice of his art, he obtained a proficiency which enabled him to hold his own with credit and applause.

In those early days when the century was young, the education of an actor meant something. Hard work and indigence were in most cases inseparable. There were no railways, with a cheap third-class for travellers; the professional 'padded the hoof,' as it was euphemistically termed, from town to town; a small bundle slung on the end of a stick or sword, or an old

* Continued from No. 953.

carpet-bag containing 'props,'—and an extra shirt, if so fortunate—constituted the whole of his luggage. A walk of thirty or forty miles on an empty stomach was by no means uncommon. A lift from a wagon was a godsend. The theatres were widely placed, and difficult of access; from Deal to Norwich or Gloucester on foot demanded all the staying powers of a Captain Barclay or a Weston. Coach-fares were mostly exorbitant, and altogether beyond the ability of the stroller. Happily, most of the younger men in the profession were single, and, as a rule, capable of enduring their hardships with a light heart. But the elder histrions, many of them with wives and families, were reduced to sad straits; provoking a smile now perhaps, after a lapse of years, but very mournful at the time. From the days of Thespis down to this hour, no lasting fame has been gained, no great reputation made, without the help of hard and incessant labour. Talent and energy will grasp the difficulties of the position at once, and by dint of unremitting effort, master them.

I claim for my dear, dead friend the merit of having surmounted these obstacles, of having fought the good fight with manly vigour, and come out of the conflict victorious. Loving his work with passionate ardour, and keenly alive to its delights, the memory of the pain and perils of his progression never forsook him. I remember the particulars of my first interview with him as accurately as though it had only occurred yesterday. I had written to him previously intimating my intention of joining a company, and soliciting his advice. He replied by return of post, explaining how fully his time was occupied, and asking me as a favour to come to him at the theatre. The nautical drama of *The Lost Ship* was then running at the Surrey—the old house, burnt down January 30, 1865—and T. P. Cooke, Mrs Honner, and Hicks were engaged in playing the principal parts. At the conclusion of this, I made my way round to the stage door, and soon found myself behind the scenes.

I had hardly time to look about me when my friend came. Fresh from the boards, heated, palpitating, quivering with excitement, his first words were, as he grasped my hand: 'Well, my dear sir, in what way can I be of service to you?' Full of confidence in my projected step, I entered with some detail into my proposed arrangements. After patiently listening to me for some time, he laid his hand gently on my shoulder, and looked wistfully into my eyes, as he delivered himself thus: 'You speak well; your appearance is in your favour. But pardon me, what are your present personal circumstances? Are your prospects for the future so unpropitious that you fly to the stage as a last resource? You are young, don't seem to be wanting in intelligence; is there no avocation in which your relatives can place you, that will not at least produce the weekly wage of a bricklayer's labourer?'

He paused for a moment, the perspiration all the while streaming down his forehead and face from his recent exertions. So great was my surprise at this exordium, that I could not utter a word. Without taking any notice of my confusion, he continued: 'Excepting under

very peculiar circumstances, I make it a point never to recommend the adoption of a professional career. You are possibly, nay, probably, attracted by the show, the glitter, the music, and the applause. The effect of these accidental accessories is of course patent to all; but the painful efforts rendered necessary to produce them are hidden from the public eye, and thoroughly known to those only whose secret labours are carried on behind the curtain. I doubt if you have counted the cost and consequences of this step. There is no royal road to eminence; the greatest actors have ever been the hardest workers. Have you courage enough to trample down the opposing forces which will as surely beset you as that the sun will rise to-morrow?'

Here we were interrupted by a messenger, who handed my friend a note, with the observation that the bearer waited. Turning aside, with a 'Pardon me,' I was left to myself for a moment; and never shall I forget the revulsion of feeling that ensued. My immature theories thrown to the winds; the ecstatic delights of a career I had set my cast upon, shattered into fragments. I had put to sea in a rudderless vessel and been wrecked. Astounded and bewildered, I sat down with my head between my hands. I was dumb-founded; it appeared like a dream. I could not think. I felt faint, and longed for a breath of the outside air.

In the meantime, my Mentor, now disengaged, came to me, and taking my hand in his as he saw my emotion, spoke in the tenderest manner. 'My dear young friend, I have thought it my duty to put the case clearly before you. At your age, a step in the wrong direction may be fatal. Remember that your success as an actor would demand the devotion of your life; you would have to fight your way inch by inch, and hold your ground as you conquered it.'

I interposed: 'You at least do not seem to have been defeated in the contest.'

Looking sadly at me, he continued: 'No, not altogether; but I have not come out of it unscathed. My wounds are numerous, and deep; my weapons have been hacked and worn, but I have always been carried from the plain on my shield! The love of my profession has been to me both sword and buckler; and if in climbing, the weapon has sometimes failed me, the buckler has always been my shelter and protection. I must leave you now; the stage must not be kept waiting, so fare you well. Think over what I have said, and do not determine rashly.'

And so we parted. Now, 'that I have unlocked my bosom of this perilous stuff,' I cannot do less than introduce my long-suffering reader to the gentleman himself, at whose door we have so long been standing.

Ringing the bell at the garden wicket, I hear a heavy footfall inside on the paved forecourt; the gate is opened, and once more, after a lapse of many years, I stand face to face with my old mentor, N. T. Hicks. Imagine a man upwards of six feet in his stockings, with athletic limbs in proportion to his height, full neck—left bare—and broad-chested. One of the finest stage faces ever seen; wide brow, surmounted by a thin crop of long light hair, now becoming grizzly; large nose of the Kemble type,

thin lips, and a noble chin, not too prominent; gray eyes, with a tearful and careworn look in them; skin slightly tinged with brown by exposure to the sun, and over all a sad expression. Asking my name, which he does not appear to recollect, I enter the opening in the wall, and make a descent of four or five steps into the garden—Hogarth's garden!

Leading me under the boughs of a huge mulberry tree, planted by the painter himself—now bound together and supported by iron bands and chains—he places himself with his back to the trunk, and scrutinising me narrowly, disclaims all knowledge of my name or person. I enter into particulars; and by degrees some faint light seems to dawn in his memory in connection with our former acquaintanceship. But the effort to recall them evidently gives him pain, and his eyes fill with tears. Taking my arm, we go into the house, where I am introduced to his wife, a gentle-looking lady of good address and breeding. I apologise for my intrusion, and explain its reasons, which she was pleased to accept with a smile of approval. We adjourn to the parlour on the left-hand side of the entrance-hall, a curiously shaped room, full of odd nooks and corners, low in the ceiling, and wainscoted throughout with oak panelling, rendered almost black with age. Here we seat ourselves; and the rays of the setting sun streaming in through the small lattices, impart a glow to the darkened wood as we prepare to indulge in 'the cup that cheers but not inebriates.'

Entering more fully into the object of my visit, I revert to some of my earliest remembrances, by instancing some of the characters which I had seen him personate in my younger days, beginning with the run of the *Jewess* at the Victoria in 1835—that I recollected his playing Othello to the Lago of the elder Cobham, in the year following at the same theatre—that, on a particular occasion, I had seen and heard him greeted with a loud and prolonged hiss—which mark of disapprobation I took to be one of the grandest testimonies to his talent that I could call to mind. The occasion was this. On the presentation of Moncrieff's version of *Jack Sheppard* in October 1839, he enacted the character of Jonathan Wild; Harding, a young man of good ability, being the Jack; Dale, the Sir Rowland Trenchard; and Manders, Kneebone. Let it be understood that Hicks was the leading actor of the company, and on the best of terms with his audience, and that, moreover, the absurd practice of hissing a performer because he happens to be cast for the villain of the piece had not yet come into vogue, and you will imagine the surprise with which this involuntary expression of feeling was received. The rapacious cruelty of the part had been so forcibly portrayed during the progress of the drama, that when, in the concluding scene, under the 'Tyburn tree' the mob are wildly gesticulating and jeering, the audience in front caught up the cry and added to the tumult. For an instant the amazed actor turned to the audience to learn what was amiss, when the clamour immediately altered its character to the loudest applause. 'Bravo, Hicks!' He had forgotten the incident; but looked pleased at my remembrance, and thanked me for recalling it.

In searching the annals of theatrical biography, it is by no means rare to find that the representation of some particular character has become so far identified with the actor's name, that the casual mention of the one almost invariably recalls the other. As thus: Garrick with *Richard III.*, Kemble with *Coriolanus*, Kean with *Othello*, Macready with *Virginus*, Mackay with the 'Bailie' in *Rob Roy*, Denvil with *Manfred*, and T. P. Cooke with *Black-eyed Susan* as William. This list might be lengthened considerably if it were necessary. Suffice it, however, to add one other name to the catalogue in the person of N. T. Hicks with *The Wizard of the Wave*. The Victoria had passed into the hands of a Mr Richard Ratcliffe in 1840, who signalled his advent by the production of a nautical drama bearing the above title, furnished by J. T. Haines. This was placed upon the stage with the utmost completeness, and supported by a company which did ample justice to its merits. Hicks performed the dual parts of Captain Faulkner and the Unknown; John Dale, Don José; Harding, Tom Truck—an admirable bit of acting; Attwood, Timothy Treacle; Miss Emmeline Montague—who afterwards became Mrs Compton—was the Donna Isabinda. Coney and Blanchard, the noted swordsmen, were also engaged, and did excellent service. The pictorial illustrations were fine and appropriate; but the last scene culminated in a triumph of stage mechanism such as had never been seen in any theatre within my experience.

Our prolonged meal concluded, my friend and I stroll out of doors into the well-kept garden. I reverted to the memory of many of the elder favourites of the public with whom he had been associated, canvassing their merits and debating their peculiarities. Liberal in his judgments, he was at the same time keenly alive to the sameness, the mannerisms of certain of his compeers. How lovingly he dwelt on the dramatic eminence of G. V. Brooke, George Bennett, Thomas Lyon, Charles Pitt, and Samuel Phelps! The combative faculty which not unusually accompanies a highly nervous temperament, had died out, and left behind it no shadow of envy or uncharitableness.

How well do I remember all the trifling incidents of that evening, little dreaming it was to be the last I should enjoy in the society of my friend on this side of the dark and ever-flowing river. I could not avoid remarking that my later edition of professional small-talk, and the occasional quip and crank with which we larded our lean conversation, were received with extra warmth. The sweet face of his good and lady-like wife also brightened with enhanced pleasure as we sat under the porch indulging in our quiet gaiety. In illustration of some of his anecdotes, he placed before me a large portfolio containing various portraits, letters of celebrities, and newspaper cuttings, about each of which, as they came under notice, he had some observation to make, or some history to relate. With a promise that I would shortly renew my visit, he followed me out of doors to the garden steps, where we parted. My town engagements being particularly pressing at this season, I could not find time so soon as I had expected to visit him again; but, buoyed up with the

hope of his returning convalescence, was less uneasy on that account than hitherto. But the receipt of a black-edged envelope bearing the post-mark of Chiswick roused my worst fears, which a perusal of the contents confirmed. My friend was dead; the lamp, long glimmering, had ceased to burn. No more the tender welcome greeting from his honest eyes! The picturesque manner, and the eloquent voice, which of old roused my young enthusiasm, lie buried out of sight; but the memory of them remains written legibly on the hidden tablets of the heart. Newton Treen Hicks died February 21, 1873, aged 62. 'To this complexion must we come at last.'

THE CLIFFORD DIAMONDS.

CHAPTER III.—WHAT BECAME OF THEM.

NAOMI came home a few days afterwards, and, as usual, we had some talk about the friends we knew at Liverpool; a word or two on dress, and then—

'Naomi, there has been a letter from Arthur Clifford,' I said.

She started, just ever so little, and grew a shade paler; but her voice was perfectly steady as she asked: 'And what news of him?'

'He is coming home.'

'I thought as much,' she said with a little laugh.

'But he is not coming back alone, Naomi,' I whispered very low.

She turned quickly upon me. 'What do you mean, Olive?' she said, her lips quivering.

'I mean—I mean—— Oh, Naomi, surely, surely you know the kind of man he is—that he is not to be trusted.'

'Tell me at once!' she cried, catching my arm.

'Tell me at once, Olive!'

'He is married, Naomi.'

She started up, and stood for a moment as if transfixed with amazement; then breaking into a low ringing laugh of bitter scorn, she said: 'So some one else will wear the diamonds after all!' It was the only word of anything like disappointment I ever heard pass her lips.

To this day it is a puzzle to me. Did she care for him or not? Was it only ambition which prompted her to reject so many suitors for his sake? Had she resolved to be Lady Clifford at all hazards, and was her heart untouched? I never knew; I never can know; we never speak of those things now.

Although Sir Arthur told his mother he was on his way home, the summer was on the wane before he brought his bride to Grange. There were no public demonstrations, no illuminations, no rejoicings. Lady Clifford (*née* Scadder) just drove quietly from the railway station in a one-horse brougham, and arrived amongst us as simply as if we had known her from childhood. I was at Grange that day; Naomi was again at Liverpool. She managed to be absent in just the most natural way in the world. No one thought it strange; I only, held the clew.

Arthur Clifford was terribly changed. The years he had spent in America had altered him almost beyond belief. It was not that he was bronzed or browned, although he was both one

and the other; not that his good looks were terribly impaired, although that also was the case. But there was a curious look about him, which told of wild company, of his having been in the society of reckless men; a flavour of rowdiness, very unlike the ease and courtesy of an English gentleman. But his wife was perfectly lovely—fair, delicately formed, slight, and graceful as a harebell. Her azure eyes, daintily chiselled features, pearly teeth, skin, resembled nothing so much as an exquisite Dresden china shepherdess. She charmed me at a glance. I had often heard of the delicate beauty of American women; but this was altogether a surprise to me. True, she had many little ways about her which were scarcely in accordance with our received ideas of the proprieties; and Sir Arthur's mother was not pleased at her voice or accent. But she seemed to possess entire sway over her husband; and so far as I could see during that first visit of hers to Grange, she was a shrewd little person, and had all her wits about her. Sir Arthur and she only remained ten days at Grange. She told us she was very sorry; but her cousin, Mayflower Scadder, was going to marry a Russian Prince with an unpronounceable name; and she had promised to be at the grand wedding in Paris. 'All the world will be there,' she said to me; 'and I'm having a gown made for it that will beat all creation.' She seemed to have taken a wonderful liking for me; and when she uttered—as now—any of her Americanisms, which she saw startled me, she would laugh or blush, and ask me if we English thought her queer. So we became quite confidential, and I think that I may have been in a very small way of use to her.

Early in September, she and her husband left for Paris. She took the diamonds with her.

'That's a clever little woman,' Uncle Tom said to me one day, shortly after young Lady Clifford and her husband had left. I was surprised, for Uncle Tom never came near Grange while Sir Arthur was there, and I did not know of his having met the young lady. I said as much.

The old man laughed. 'Oh, she came down to the Mills and made my acquaintance, my dear,' he said. 'Went all over the factory, asked questions about everything; and really she seems to be a most intelligent little body. She was very eager about the mineral wealth of the place. Mark my words, Olive: you'll see the coal-pits opened before a year goes round, or I am much mistaken.'

I did not think very much of his words just then; but when an agent from London came down and began to examine the bleak moors between Grange and the sea, and when queer-looking implements began arriving at the small station near, I found the truth of what he said. Lady Clifford was not a woman to suffer her thousands and tens of thousands to lie idle; she would make good use of her wealth, and every pound must turn into forty shillings. I suppose she was right; but to me there seemed to be a terrible greed about this headlong race after wealth. I may have done her wrong. Now, I know that I did, and I am sorry.

Spring was beginning, bleak and cold, as it

usually begins with us in our hard north, when Sir Arthur and my lady returned home. Ruth was at Grange; but at once she resigned the reins of government into the clever hands of the little American; and capital hands they proved to be. She was born to govern, that fair, slight, childish-looking woman; and uncle, who condoned her husband's crime for the sake of his beautiful wife, told me more than once that he had never met a woman with such a head for business. She was at everything, seen everywhere; nothing escaped her keen eyes, or baffled her acute penetration. Moreover, from her exceeding beauty, her known cleverness, and her reputed wealth, she became the most popular little woman in the west of England.

The Cliffords were a good deal asked out that year. After Easter, they went to London, and a Countess presented the little American at the last drawing-room of the season. She was wonderfully admired; in fact, she became the fashion; and Sir Arthur became to the world 'Lady Clifford's husband.' I believe Naomi and he met once or twice in society in London, but I never inquired about it. It was a subject upon which there was silence between us.

In August, the lady and her husband returned home. The admiration she had received had not in the slightest degree spoilt the little beauty; she was just the same shrewd, practical young woman as ever, with an eye on everything, a finger in every pie; and Sir Arthur never interfered with her. He and I seldom encountered one another; by tacit consent, we kept out of each other's way; and although his wife and I were great friends, I scarcely ever exchanged more than a passing word with him; neither did Uncle Thomas nor my father have any intercourse with him; and whispers of debasing habits learned abroad, and practised in secret, began to circulate amongst the people. For my own part, I hardly know if they were or were not true. I remembered the avidity with which he drank up uncle's wine years ago, and I shuddered. Everything outwardly seemed to flourish with the Cliffords. The mines were now in full work, and the yield of coal exceeded the wildest dreams of the proprietors; wealth seemed pouring in upon them.

The presence of the younger lady at Grange made but little change in our intercourse with our dear Lady Clifford; and I observed with deep joy, how the elder's prejudices were gradually wearing away, and how the younger was slowly winning her way to her mother-in-law's heart. I have said that young Lady Clifford was very popular in our part of the world. Even at the Duke's, she was the reigning belle; and it was whispered that a great ball which he was to give at Beckley Towers about Christmas, was chiefly in honour of her.

This ball at the Duke's was the theme of every tongue for many weeks before it came off. Invitations were sent to us; and as Joe, Harry, and Naomi were all at home and wild to go, I promised to go too.

Lady Clifford was staying at Beckley Towers; while we humble individuals were content to drive the long fifteen miles on a winter's night. The ballroom was a sight to see, with its artistic decorations and gorgeous dresses. The company

was most distinguished, even counting a Royal personage in its number, with dozens of celebrities besides. Ere I was half an hour inside the flower-wreathed door, I had encountered half-a-dozen acquaintances, which made things exceedingly pleasant to me; amongst the number was an old clergyman, a dear friend of my father's, and with him I made the circuit of the gorgeous rooms and superb galleries. It was a real pleasure to go with him, because he knew all the famous pictures and could point them out to me.

'There are some fine Van Dycks at Grange,' he said, pausing before a splendid portrait by that master. 'But I think this is the finest specimen of him in the north of England.—By the way, have you seen Lady Clifford to-night? She is quite the loveliest woman in the room; and her dress is a marvel.'

I felt amused at the old clergyman's simple admiration for the young American; but when I saw her afterwards, dancing with the Royal personage, and attracting quite as many eyes as he, I did not wonder. She wore the celebrated diamonds—the diamonds which I had seen under such different circumstances a few years ago. They seemed to create a luminous circle around her, glittering on her fair head, her slender throat, her shapely arms and bosom, and starring the puffed and looped folds of her pale pink brocade dress. No wonder every one looked at her. There was not one amongst the number who could bear comparison with her. We had just a few whispered words together, and I lost sight of her in the crowd.

I was terribly tired after that ball, and resolved that it should be my last; nevertheless, I had enjoyed it after a fashion, and certainly I amused dear old Lady Clifford for three whole days with my account of it and of her lovely daughter-in-law's success.

On the fourth day after the ball, Sir Arthur and his beautiful wife returned home; and on the evening of their return I got about the greatest surprise of my life. Just as I was preparing for our family dinner, a tiny note from Lady Clifford, requesting me to go to her at once, was put into my hand.

'Her ladyship's sent the brougham,' my maid told me; 'and the man says he's not to go back without you.'

Feeling certain that something ominous had occurred, I wrapped a cloak round me and drove to Grange. I was shown into the smaller drawing-room much as usual, and found Sir Arthur, his wife, and mother waiting dinner, also in the most usual fashion.

'Oh, you're come, dear,' cried the younger lady in her effusive manner. 'So glad—so very glad to see you. Now we'll have a good time together and discuss the ball in real style.'

I felt mystified. Surely she never had sent for me in such an urgent fashion only to have a gossip about the ball. I failed to understand her. I remained in a state of puzzle all through dinner and for some time after it, until the elder lady having gone to her rooms, and Sir Arthur being left to the company of the wine-bottle, the little lady brought me into her boudoir, closed fast the door, and facing me, said with a slight laugh: 'Olive, I've lost the diamonds.'

I staggered back and gasped for breath. 'Lost the diamonds?' I faltered. 'Lost?'

'Yes, yes. They were stolen out of my room at Beckley. Isn't it awkward?' She seemed to me to take it much more easily than I could. To me, the loss of those splendid jewels seemed something almost overwhelming, while to her it was only 'awkward.'

'It is a terrible misfortune,' I said.

She laughed one of her gay, little, bird-like laughs. 'Oh! as for that, they can be easily replaced; but it is rather awkward to lose them just now.'

I had heard of American recklessness, American extravagance; but to meet with such an example of it in her, in this clever managing little woman, who seemed to look so sharply after everything, almost took away my breath. I felt cruelly disappointed in her.

'To a person of your enormous wealth,' I said coldly, 'the loss of a suit of diamonds worth twenty or thirty thousand pounds may seem a trifle, as you can so easily replace them; but to my mind'—

She stopped me short by flinging her arms around me and kissing me heartily. 'O Olive, don't, don't!' she cried, laughing aloud. 'You'll kill me, Olive; yes, you will. But—how were you to know? I hoodwinked you with the rest of them. Now I'll make a full confession. You're real grit, Olive Thorp, gold through and through; and you'll like me better for being honest and true with you. Sit down there, and listen to me. I don't want to make a fuss about those diamonds, or have any talk over them, because—because'—

She stopped, and her beautiful face flushed up. Then she leant forward till her face almost touched mine, and whispered: 'Because they ain't the real ones!'

I sat staring at her for a few moments. 'Not—the—real—ones?' I gasped at last, horror-stricken.

'No; they are not. The real ones are at Cannes with Mayflower, safe and sound. I sold them to her, and had these made in imitation of them.—Oh, don't look so horrified. Arthur knew the whole affair from first to last. I wouldn't have done it without his consent for a hundred worlds; but— Didn't you always think I had lots of cash?'

I said I was led to believe as much.

She shook her little head. 'Bless you, I hadn't a cent, not I. It was Mayflower had the fortune. Uncle Pete died worth I can't tell you how much. One half he left to Mayflower, and the other half to her brother Devereux. Poor Mayflower! her appearance is ordinary beyond thought, but she is clever and quick. We were prime friends, and we never got jealous of each other. I reckon we got our share fair enough. She had the fortune, and I had the face. We were staying together in an hotel at Brooklyn, when Arthur and I came across each other. He thought I had the fortune, at first, and made up to me.—No, no; I didn't deceive him. I got too fond of him, poor old fellow; and he behaved like a man—he did indeed.'

She looked into the fire for a moment or two contemplatively; then she went on: 'He told me he was very poor, and that if he had a

little money, he could grow as rich as the best of us. First, I thought about getting Mayflower to lend us money to start the mines; then Arthur told me of the necklace and all the rest. I spoke to Mayflower on the spot. She offered me the highest market price for the diamonds; and I took it. So we came to Europe; and in Paris we met a cousin of ours that was married to an Austrian Count; she got us there to her house in the Champs-Élysées, and before you knew where you were, produced this sleek Russian Prince, and made up a match for Mayflower. He's a good fellow, though, and kind to Mayflower. They are at Cannes now; and she's as happy as need be.

'Well, when I went over to the wedding, I took the diamonds to a celebrated man in Paris who can imitate such things so that no one could know the difference between the mock ones and the real; and he copied the Clifford diamonds for me for a mere trifle compared to the value of the real ones; and Mayflower gave me down in hard cash forty-four thousand pounds sterling, for the lot. Then we started the mines; and now we are getting rich in reality, and have everything we want. Isn't that better than having a lot of grandeur locked up in a box doing good to nobody? Eh, Olive?' We are giving work to over three hundred men, improving the place, spending a good deal amongst the poor folks, and all just because we sold these old diamonds. I'm practical, you see. But I don't want a fuss made. I wish the thief joy of these stolen make-believes.'

I grew to like her better after that confession of hers than I ever had done before; and as the years went on, and I, her most intimate friend, saw the heavy cross laid upon her in her domestic life, and how bravely she bore it, I came to love and honour her above all the women I knew. As for Sir Arthur, he sank lower and lower, not swiftly or suddenly, but with a slow and sure decline, until, despite his brave little wife's efforts to uphold him in the eyes of the world, men talked publicly of his disgrace, and the sins of his youth were remembered against him. At last, he died, leaving his widow dowered more amply than any Lady Clifford had ever been before. She was still in the heyday of life, good-looking and attractive; but she never married again, devoting herself solely to the young Sir Jasper Clifford, her handsome boy, who would succeed to all the wealth she had made, and his beautiful sister Ida, who inherited much of her mother's spirit. Lady Clifford lived on at Grange until her blind mother-in-law's death; and soon afterwards she and I went on our travels together. All my people were married then. My three brothers had homes and families of their own, and Naomi too had married. Hers was the strangest marriage of them all, for her husband is no other than the Devereux Scadder whose sister possessed the famous Clifford diamonds. He is a fine fellow, devoted to Naomi, for whose pleasure he has built a charming villa close to his sister at Cannes.

Once, just last year, I saw those diamonds again. It was at Rome, at a reception given by the Princess Ivan Doughbrousky, *née* Mayflower Scadder. The little brown, beady-eyed woman

seemed lost in the blaze of them; and I could not help thinking they were very useless things after all.

VINTAGE-TIME.

OLD Father Rhine was bearing his share of the last contingent of summer travellers to their various homes. These included the ubiquitous American; the grave and solemn Russian; the portly German with wife and family, who, having soused themselves thoroughly at some watering-place, were wending their way back to their *sauerkraut* and indigestion; and lastly, many a son and daughter of Albion, whose healthy happy faces, bronzed by Alpine and Italian suns, showed that they had not been wasting the summer in idleness or in drinking 'drumlic German water.' The towns and villages were reaping the last of their annual spoils from the tourists; the air was filled with the scent of ripening fruit; the steamers and river-barges were piled high with baskets of apples and pears; and the last of the great rafts from the Black Forest with its floating village, moved silently down the majestic river towards the sea. A rich harvest was in store for the Rhineland. The destructive night-frosts of May had not molested his vines this year; a warm and generous June had helped them through the precarious season of blossom; a broiling August sun had ripened the fruit, and a beautiful September had brought the grapes to perfection. Autumn had already changed the green of the leaves into the richest of yellows and reds and browns; but these gorgeous tints failed to conceal the deep blue purple of the ripe clusters beneath, which lent their colour to the mountain-sides. Mountain and valley glowed in the richest of autumnal tints, the reflection of which was taken up by the deep flowing river, and mirrored back on its constantly changing surface.

The whole Rhineland population was in a state of anxious excitement, and all hopes and fears were centred in the one question—the weather. Rain at this critical period would blight all the hopes a glorious summer had raised. The vintage does not take place simultaneously all along the Rhine; indeed, weeks often intervene between the gathering of the grapes in various districts; and in the Rheingau, where grow the wines which render the names of Johannisberg, Steinberg, Rüdesheim, &c., justly famous, the gathering-in is often so long delayed, that it is only approaching winter which hurries the housing of the grapes. In other districts, where vineyards unknown to general fame yield good and generous wines that later on adopt the names of their more famous sisters, the day for commencing the vintage is fixed by the local magnates, among whom the village burgomaster and the larger proprietors stand supreme.

At the village of H—, the local magnate was indeed a portly person, credited with being able to drink several gallons of wine daily. He was a short, thick-set, man about five feet high, and about as many in circumference, dressed in a blue linen blouse, blue linen trousers, and a blue

cowl on his head. His broad face vied in its reds and purples with the colouring of the richest cluster of grapes; and his small sharp twinkling eyes floated in two welling lakes of tears. The way in which this village oracle, constantly buried in clouds of tobacco-smoke, gave forth his autoeratic utterances, and then lapsed instantly into the severest silence, was well calculated to impress the peasantry with a sense of his unfathomable wisdom. Almost every village possesses some such magnate, who, grown up in their midst, knows everything about everybody, and possessed of a little more than average shrewdness, is looked to for advice in almost every emergency. He acts as arbitrator in small matters of dispute; and many little squabbles and quarrels are prevented from growing into lengthy matters of litigation by his fair and equitable administration of justice. The oracle had fixed the following day for the commencement of the vintage, many an anxious eye was turned towards the glowing heavens, and every little cloud was scanned as it floated across and melted into space. The evening promised well, and the quiet romance pervading everything was delightful as we watched the signs of the night from among the moonlit ruins of the old Schloss on the top of the mountain. To the south lay the ancient town of Andernach, with its old old towers and spires, bathed in the softest moonlight, guarding the entrance of the gorge. The villages below lay hushed in sleep, and no sound broke the solemn stillness but the gentle murmuring of the mighty river as it rolled along.

Daybreak came, and found everybody up and busy. Old and young—the wealthy proprietor with his guests and friends, for everybody who has friends and has house-room to offer them asks them to join in helping at vintage-time; the peasant who with his children cultivates a few odd patches of ground—all are dressed in blue linen, the women in short blue gowns, the men in blue blouses and trousers. Armed with knives, shears, clippers, of all dimensions and shapes, some carrying great wicker baskets lined with pitch, and called *Lehne*, they moved off to the mountain-sides. The women carry the *Lehne* on their heads; the men carry them on their left shoulders, and support them with a thick crooked stick. When full, these *Lehne* weigh upwards of a hundredweight, and are often borne over the roughest and rockiest of tracks for miles. Oxen were yoked to huge lumbering wagons, on which were placed vats. These toiled up the precipitous paths to every accessible point among the terraced vineyards. In the pressing-houses in the village, all was bustle and activity. Vats were being rapidly prepared to receive the grapes; huge casks were placed upright, with the top ends taken out; crushers and stampers got a final cleaning; and weighing-machines were placed in readiness to record the weight of the various baskets as they were brought in. Those who remained in the village were all awaiting the first arrival of the grapes from the mountain-sides, when suddenly a cold draught of air swept down through the narrow gorge of the Rhine—the tolling of distant bells was wafted warningly on the breeze from village to village, and down came a dense white damp fog, burying mountain and

river in its gray vapoury folds. The bells of the village church at H—— joined in the ringing lament which summoned the workers back from the vineyards. All gathering operations must cease when this wet fog comes down. Apart from the actual danger to those employed in collecting the grapes, the air becomes so impregnated with moisture, that the grapes in a few minutes are covered with large beads of water. Were they gathered in this state, the produce would be as much deteriorated as if the grapes were gathered in a pelting rain. The burgomaster, in the interest of the community, and to preserve the good name of the district, causes the village bells to summon all to cease gathering. For those high up on precipitous ledges of rock where the vine loves to grow, such a fog brings its own element of danger, and lucky are they if they can reach safe ground before the mist renders each step one of peril.

A couple of hours elapsed. Groups of anxious people wistfully watched the cold wet fog as it swept slowly by, at times dense and impenetrable, at others thin and vapoury, exposing for a second or so the pale disc of the sun as it struggled through. These were two anxious hours. If the fog rose, rain was inevitable; whereas if the fog fell to the earth, a fine day was certain. At length the question was happily settled. The vapoury masses collected in the hollows of the mountains, the blue sky appeared overhead, and the sun burst forth triumphantly. With happy faces and gladsome songs, the people once more streamed forth to the vineyards, and for that day they had no interruption to fear. Soon the heavily filled baskets began to arrive, and the fruit was eagerly scanned. Very different indeed were these bunches and clusters of grapes from what one is accustomed to see on the table in England, and a poor figure these little shrivelled-up berries would make beside the produce of an English vinery. Their value, however, does not lie in their looks, in the ordinary acceptance of the term. The thick saccharine juice they contain—the result of excessive ripeness—the deep-red hue of the stalks and stems of the clusters—these are what call forth the admiration of those who know what such juice will yield.

The first baskets had hardly been in the pressing-house a few minutes, before the happy vintner came forth and told us that the must-tester floated higher than it had been known to do for years. This meant that there was more saccharine matter in the juice of the pressed grapes than had been known for years. Next he came with a small flat silver cup to taste the must, the shallow cup and brightness of the metal enabling you to judge of the colour. And now men and women began to arrive in greater numbers; wagons came lumbering heavily laden from the vineyards. Crushing and pressing went on briskly in the pressing-houses all day long. Occasionally some of the bearers themselves toppled over into the vats as they emptied their heavy baskets, and had to be extricated, sticky and dejected, by their laughing comrades. All mouldy and rotten bunches have to be removed; and sometimes it is necessary to ascertain that some of those who bring in their produce do not add water. As a rule, the Rhineland is honest; but there are black-sheep among them, who have been clever enough to find out

that one pound-weight of water is equal to one pound of grapes, and costs less.

The gathering of the grapes in the vineyards ceased at about half-past five P.M. for the day; and charming it was to listen to the happy voices of the people in the soft balmy air, at first distant and low, but gradually approaching nearer and nearer, and bursting out into rich melody as they descended from the echoing hills to their village homes. In the vineyards, the work was over for the day; but not so in the pressing-houses. The ripeness of the fruit caused fermentation to set in immediately; and as simultaneous and regular fermentation is of essential importance in the making of good wine, all the gathered grapes must be crushed and vatted without delay. No individual berries must be left to burst of themselves later on, and thus disturb the harmony of the fermentation. The old method of stamping the grapes with the feet, though still practised in the south of Europe, has long since died out on the Rhine. The crushing is here effected by passing the grapes through large revolving rollers. The great care which has to be taken in the cultivation of the vine on the Rhine, owing to the changeable climate, and the constant nursing required to bring the extremely delicate wines to maturity, have brought the science of viticulture to the highest perfection. The high prices paid to the growers for their produce is sufficient proof of this.

Knowledge gained by long experience is the only guide in selecting and arranging the grapes suitable to be allowed to ferment together. The wind and cooler air to which the vines on the higher mountain slopes are exposed, influence the fruit materially; the excessive moisture, on the other hand, to which the lower lying vineyards are subjected by the drainage from the hills, increases the quantity of the wine, but does so at the expense of the quality. As a rule, the finest wines are prepared from grapes grown half-way up the mountain-side. A great many considerations arise among others as to whether stems and husks should be allowed to ferment with the juice; but as regards this, no rule can be laid down, and only patient watching and experience enable one to judge with any degree of accuracy. Temperature, again, is of vital importance; but a knowledge of when to arrest and how to control fermentation can only be gained by practical experience in the pressing-houses.

The hard work of the first few days of the vintage did not allow of much merry-making; but the bright faces, the cheerful 'Guten Morgen,' with which one was greeted everywhere, the joyous singing, sufficed to show that the spirit of thankfulness was abroad. As the days went on, and the work became lighter, the big room and the gardens surrounding the village inn became thronged with people; fiddles, trombones, violoncellos, and every available musical instrument, were brought into requisition; while mine host, who had taken time by the forelock, had already brimming bumpers of newly made wine to offer to his guests. Dancing and merry-making were carried on far into the night. For these people, a good vintage means a provision for months to come; the demon of want and starvation has been driven from their doors; winter may come

with its keenest blasts—they are prepared, and they are happy; and their happiness and content are a genuine thanksgiving for the abundance showered upon the land.

A MYSTERY OF THE PACIFIC.

FAR away in the South Pacific Ocean, stretching from the coast of Asia for thousands of miles to the east, there extends a vast series of archipelagoes and island groups, partly, without doubt, the remains of a former continent now merged beneath the waves. Here is the far-famed Coral Sea, with its countless islets and calm lagoons; and here are numberless volcanic islands, rich in luxuriant vegetation, where Nature seems to have been especially prodigal of her gifts, but which are ever the sport of the terrible subterranean forces that act with such fearful potency throughout all this region. Till comparatively recent times, little was known for certain with respect to the islands of the Pacific. Mendana and other pioneers of exploration had, it is true, shed some light on the subject; but the tales of early travellers were mixed up with many wild improbabilities and exaggerations. Dim stories floated about of the savage nature of the South Sea Islanders, and of the exploits of Dampier or of the Spanish buccaneers. Tales, too, of the fabulous wealth to be derived from trading in the Pacific, found ready listeners everywhere; and the public credulity on the subject was too clearly shown in the history of the South Sea Bubble.

Of late years, through the discoveries of gallant explorers, we have learned more of the true facts of the case, and many old illusions have been dispelled. But, as has been so often said, truth is stranger than fiction; and the facts to which we are about to draw attention will yield in their wonderful nature to none of the strange and fantastic tales with which sea-captains were formerly wont to astonish the credulous at home.

In the far East, forming, as it were, the outpost of the South Sea groups, is a solitary volcanic island called Easter Island. It is thirteen hundred miles east of Pitcairn, the next island in the series, and, with the exception of Sala y Gomez, a small rock without inhabitants or vegetation, there is no land between it and South America, which lies more than two thousand miles to the east. Easter Island is only eleven miles long by four broad; yet in this small space is crowded perhaps the most wonderful and mysterious collection of remains of a prehistoric people to be found on the earth. At the south-west end are nearly a hundred houses, built of stone, with walls five feet in thickness. The inside of the walls is lined with upright slabs of stone, painted in black, white, and red, with figures of animals and birds, and with other designs. The houses are roofed in with overlapping slabs of stone. In some of the houses, numbers of univalve shells have been found. Near these wonderful ruins, the rocks are carved into fantastic shapes or faces, most of the sculptures being now almost overgrown with bush and underwood. The present inhabitants know nothing whatever of these houses, which, existing as they do in such large

numbers, seem to point inevitably to a former race of natives of far higher civilisation.

We can understand that a former race may have erected the houses and carved the sculptures mentioned above, wonderful as they are compared with the huts of the existing natives. What follows is, however, more difficult of explanation. On nearly every promontory are erected huge stone platforms, facing the sea, and presenting a front sometimes nearly three hundred feet long and from twenty to thirty feet high. The stones composing these platforms are often six feet long, and are fitted together without cement. The top of the platform is generally about thirty feet broad; and the structures being built on sloping ground, the wall facing the interior of the island is only about a yard high. Another terrace, a hundred feet broad, is levelled landwards, and ends also in a wall of stone. On these immense platforms are great pedestals of stone, on which once stood gigantic statues, which, however, are now all thrown down and partially mutilated, with the exception of those on the platform near the crater of Otouli, which are still erect. Some of these images were thirty-seven feet high; but the average height was about sixteen or seventeen feet, other statues being much smaller. The heads of these sculptured images are flat, and were formerly capped by crowns of red tufa, a stone that is found only at a crater called Terano Hau, near which have been found a number of crowns ready for removal to the statues. The faces are square, and are said to be of a disdainful expression, the lips thin, and the eye-sockets remarkably deep, perhaps to admit of the insertion of eyeballs formed of obsidian, which is also found on the island.

Captain Cook, who during his second voyage visited Easter Island, remarks that the shade of one of these statues was sufficient to shelter all his party—nearly thirty persons. He believed them to be burying-places for certain tribes or families. But whatever may have been the original intention of the sculptors, the present natives can have had nothing to do with the execution of these wonderful monuments. They possess, however, small wooden carved figures, but totally different in features from the stone images. We are forced to the conclusion that the houses, platforms, and statues are all relics of a remote age. The natives have a tradition that they formerly migrated to their present abode from one of the islands of the Low Archipelago; but this throws little light on the subject. How, in any age, could a people furnished only with a stone chisel—for the Polynesians are still in the Stone epoch—have carved such statues by hundreds and built such enormous platforms? And the difficulty is immensely increased by the small size and complete isolation of the island. At present, Easter Island remains the greatest mystery of the Pacific—one of the great mysteries of the world.

The ruins of Ponapé, however, are scarcely more easily explained than those we have been describing. Ponapé is one of the Caroline Islands, and is about fourteen miles long by twelve in width. On the bank of a creek in the Metalanien harbour stands a massive wall three hundred feet in length and about thirty-

five feet high. It is built of basalt, the stones being in some cases twenty-five feet long. On passing through a gateway in this wall, a court, inclosed by walls thirty feet high, is reached. This court is now almost hidden in parts by luxuriant vegetation; but on investigation, a terrace eight feet high and twelve broad is found to run round the inside of the inclosing wall. Low walls running north and south divide the court into three parts, in the centre of each of which is a closed chamber fourteen feet square, roofed over with basaltic columns.

The labour of building these structures must have been enormous, for there are no basaltic rocks within ten miles, with an intervening country thickly wooded and precipitous. Such an exploit is evidently entirely out of the power of the present savage inhabitants. The theory that the buildings were the work of Spanish buccaneers is also untenable. No adequate explanation has yet been offered; but, as in the case of Easter Island, we seem driven to the hypothesis of an ancient civilisation extending over some parts at least of the Pacific. Admitting this, we might suppose that Easter Island was chosen, possibly expressly on account of its isolation, as the sanctuary of the religion of some confederacy or group of tribes, who might by their joint labours have produced the mighty structures which now baffle the archaeologist. On the same supposition, the buildings at Bonapé might be considered to have been the temple of the gods of some powerful nation. But all this is mere conjecture. If there ever was such a civilisation, which way did it spread? Was it from the West or from the East? And in either case, how can we account for its spontaneous growth in such an isolated region and under conditions so unfavourable? These are questions which we cannot hope to answer; probably they will always remain unanswered. The past history of the South Seas is veiled in deep obscurity. Could we but gain an insight into the remote past of this quarter of the globe, perhaps a picture would be revealed, by the side of which the tales of Montezuma and the Incas of Peru would sink into insignificance.

CIVILISED GAME.

When we see the familiar pheasant on the table at meals, we take it for granted that until it fell a victim to the breech-loader of some fortunate sportsman, it was a simple child of nature. It is quite as likely, however, that it was not. Few people perhaps are aware of the thousands of these birds that are raised by hand, in order to provide an ample supply for those sportsmen who like to kill birds without having too much trouble in hunting for them. A great deal of labour is expended in furnishing such game. The business of rearing the birds from eggs, under the domestic hen, involves careful supervision by day and night on the part of a staff of experienced keepers, who, in the beginning, have also no little hard work to do in collecting the eggs. Besides the danger the little birds run of being stolen and sold to some neighbouring estate, they are also liable to be destroyed by weasels, stoats, and rats. Even the

jackdaw, from a pure love of mischief, will bite off their heads if he gets the opportunity.

In the case of the baby pheasants, they will not, until they are ten days old at least, enter the carefully boarded wire-run in front of their coops; and have to be fed upon a delicate mixture of finely chopped egg and meal. Even after they are strong enough to roam about, the keeper is compelled to maintain a sharp look-out when the day is wet, as the long damp grass often proves fatal to their constitution. Until the age of two months is reached, when they are turned into the woods, the pheasants have to be fed five times a day; and a vigilant watch must be kept at night, as they are liable to be pounced upon both by two-legged and four-legged thieves.

'DAME AUTUMN HATH A MOURNFUL FACE.'

SUMMER is dead : too soon her radiant shape

Beneath a humid pall of leaves is laid ;

Too soon is fled the swallow, to escape

The biting wind, and winter's cruel shade.

Summer is dead : the weeping forest tree

Repeats the cry amid its falling leaves ;

Past is the cheerful hum of laden bee,

Vanished the mellow glory of the sheaves.

Now do grim shadows usher in the night,

That follows fast upon the shortened day ;

More boldly doth the night-bird wing her flight,

And croak defiance to the moon's wan ray.

Now doth the peasant, hastening sadly home,

Trembling, recall some half-forgotten tale ;

How in the chill of evening, elf and gnome

Sporting, hold revel high on hill and dale.

Up from the deep moist bosom of the earth,

Autumn arising shakes her dewy hair,

And leaves the sedgy marshes of her birth

To soar aloft ; a creature wondrous fair !

But pale and sad : one slender hand upholds

Above her head a veil's translucent sheen,

That falling, wraps within its silv'ry folds

Her limbs, whose charm thus hidden, yet is seen.

A weird light flickers faintly round her head,

And sparkles on the tinted gossamer

Of delicate wings, that to the breeze outspread

Support her flight, yet scarcely seem to stir.

Yet tears are in her eyes, ah ! mournful tears ;

A shadow dims her pale brow as of pain ;

Telling of faded hopes in vanished years,

Of mirth and joys that may not come again.

So have I heard her from her couch arise,

When night is full of murmurs, and the sound

Of the chill air that rustles as she flies,

And the dead twigs that crackle to the ground.

And thus she floateth, brushing from the bough

The russet leaves that sadly linger there ;

And wreathes them into chaplets for her brow,

Or plucks the drooping flowerets for her hair.

And while the pattering rain-drops on the grass,

Fall with a ceaseless monotone, the night

Enwraps her, and the stars behold her pass

Through the bleak darkness in her silent flight.

PRICE 1½d.

AN OLD STORY.

IN Mr Jennings's delightful *Rambles among the Hills*, no description is more real than that of Bolsover Castle. Even on the minds of the most prosaic of mortals, very weird must be the impression left by that lonely old-world spot. Yet how impossible it is to instil into those who have it not, that love for every visible and tangible memento of bygone times, which some feel to be a continual source of pleasure. It may be doubted whether among the crowds who gaze on the gray walls of many a noble ruin, or pace the oak-panelled galleries and chambers of one of our well-preserved ancestral Halls, more than one or two in a hundred enter into the inner spirit of the place, and luxuriate in what may be called the true sentiment of antiquity. One will wonder at the massive walls, admire the beauty of the carving, and perfection of the site. Another, admitting these, possesses a keener enjoyment in the vivid realisation of the *human* interests connected with these old time-worn habitations; he will feel an intense longing to know *something* of those whose homes were here—a passing sadness at his entire ignorance. It is true that the dwellings of those whose names, from whatever cause, are inscribed on the 'roll of fame,' do to some extent satisfy these longings. The actions of their former occupants live in history; we know their faces, and are familiar with some of their inmost thoughts; and yet of these it is truly said: 'Time hath his revolutions, and there must be a period and an end to all temporal things—an end of names and dignities, and of whatsoever is terrene. For where is Bohun? Where is Mowbray? Where is Mortimer? Nay, where is Plantagenet? They are entombed in the tombs and sepulchres of mortality.'

It is the small desolate ruined tower or grange, barely retaining the name, and some shadowy legend, generally of tragical shape, once the homes of those nearest to ourselves in rank and means, which we people with ideal figures; although the *real* ones, their countless different

characters and natures, their quiet every-day life, joys and sorrows, faces and ways, are, and ever must be, absolutely unknown to us. There are few people in dear Old England who cannot, in their own neighbourhood, point to more than one edifice, whose remnants of carved stonework, half-obliterated inscriptions and coats of arms, and pillared gateway, show that it has seen better days, explained by the 'handle to its name,' the little addition of 'Hall' or 'Court.' How impossible to look without interest on the mass of gray buildings, gay with wallflowers and stonecrop, and not hunt out the place in the County History, where, among pages given to families long passed away, we find perhaps the forgotten crest, the name, and words, 'Extinct before 1600.' In some cottage near, when the quaint oak chair or old delf plate is noticed, the owner remarks: 'Ay, grandfather used to say *that* came from the old Hall.' A tinge of melancholy subdues the fancies in your mind while looking on the poor relics from that house whence the last of his race has so long departed. You feel the grandest castle, with all its glamour of chivalry and tragedy, 'lords and knights and ladies gay,' does not possess the nameless charm which invests such places.

There is a false sentiment prizing things that are old solely because of their antiquity, or because they are the passing fashion of the day. For he who thus regards, there can be none of that feeling that makes the heart thrill, when the faded piece of patchwork is uncovered, and among the ancient hues and patterns is one small square of mayhap great-grandmother's wedding-gown. He will not understand in the least the wistful regret with which, when the little old red Prayer Book of the last century is opened, we gaze on the withered brown rose-leaves which drop from its time-stained pages—gathered in such far-off summers, and though scentless and colourless, telling a tale of sunny days so long ago, that none are left on earth to remember them. Quite incomprehensible to him will be the tender, almost reverential touch with which that broad white

satin ribbon is untied, fastening the packet of letters 'From my dear son Joe,' when we remember that that loved one was killed in Cuba, a hundred years ago; that all his family are gone, his very name and existence forgotten, until that long hidden bundle of papers arraigns a warm-hearted sailor vividly before us. What a theme for romantic dreams does that slender wine-glass afford, below whose ornamented rim is engraved, 'The charming Miss Jenny Walker.' The frail glass has long survived the fair reigning toast of some eighty or ninety years ago. Is she the figure in that nameless portrait, in white satin and floating lace, hair looped with pearls, and slight fingers clasping a rose, a curiously spotted spaniel crouching by her side? No one knows; for of her not one single memento remains but that ancient glass, and perhaps the egg-shaped rouge-box of enamelled Battersea china painted with tiny flowers. A peculiar charm, a subtle melancholy, invests, for some, such objects, quite indescribable to the uninitiated.

In the writer's family, some time ago, a set of papers were found which for long years had not seen the light. By means of these musty, yellow pages, written in faded ink, in clear handwriting, we find ourselves transported to an ancient Hall in the south of England, to roam from room to room, and look on each, exactly as they were in 1746, the year after the Young Scottish Chevalier unfurled his standard! Far in the depth of the country, the old house stood, four miles from the nearest small market town. No picture of it remains; so a mental one must be formed of a many-gabled lath-and-plaster, 'post-and-pan' dwelling; or perhaps a long, low brick house, mellowed by time into harmonious greens, reds, and yellows, covered with roses and geraniums, surrounded by stately trees, and incomplete without its bowling-green, fishponds, and gay parterre. Who knows how rich in colour were the old walls inclosing this haunt of bees and birds, and how sweet the perfume wafted from the lilacs and syringas, gillyflowers and fair white lilies?

The owner of this old house, who lived here alone with his servants, we will call Squire Chalcot. He was the last of his name; and for generations, had been, with every circumstance connected with him, totally forgotten, until the contents of the papers enable us to picture very vividly his surroundings. Nothing striking or sensational was discovered; no hidden secrets came to light; still, this sketch of an old house, and its contents so long ago, may, from its truthfulness, possess some little interest.

The mere names of the rooms at Chalcot Hall have an old-fashioned ring. The 'hall' of course, with 'Delph' ware standing on the mantel-shelf and in the oak corner cupboard; the 'Ale and Small-beer Buttries,' the 'Parlour,' the 'Buttery Chamber,' the 'Hall Chamber.' The furniture, chiefly oak, would suit the panelled rooms.

There were India-backed chairs with brocaded and flowered cushions, worked curtains, marble and velvet-topped card-tables. And are not several sets of powder and patch boxes mentioned among the bedroom furnishings? The eyes of many ancestors watched their last descendant from the picture-covered walls—fair dames in powdered heads and huge hoops. Men in high-peaked hats and buff jerkins, or, more likely, flowing love-locks, for among the large number of pictures, one only is described, 'A Portrait of Charles I.' Surely some of these gallants have fought for the crown, and the old man may have mourned his inability to send a scion of his house to further the cause of the 'king over the water.'

Squire Chalcot's musical tastes were evident. That flute on summer nights would startle the owls, who had all their own way in the shady garden; an air or two on the violin or hautboy would help to while away the long evenings; a pleasant change from the game of backgammon with some neighbouring crony. There stands the board on the spindle-legged table, beside the 'ostrich egg and painted cocoa-nuts,' and the 'bowls for ninepins' tell of outdoor amusements. The quiet slide of time in that remote spot was pleasantly marked by more than one quaint silver clock; and what excuse could lazy servants give for late rising, when the great 'larum' in its glass case up-stairs sounded in the morning? Let us peep into the chambers above. 'Mrs Molly's,' one is called; and we wonder at the ponderous bedsteads, and imagine the suffocating feeling of sleeping behind those 'cloth curtains lined with silk,' or coarser 'camblet' or fustian, especially as none but feather-beds were used. The 'lace counterpanes' and 'silk damask quilts' sound quite in harmony with the many-carved and 'guilt-framed' looking-glasses. The heart of some Mrs Joan or Mrs Betty, who in close mob, fustian gown, and tidy neckerchief, ruled the domestic arrangements, must have rejoiced in the 'spruce chests' and presses laden with 'linen' and 'calico,' 'dowls' and 'huckaback;' and the vast store of china, glass, and the like, from the 'flow'd wine and syllibub glasses,' to the 'horn, glass, and pewter dishes.'

And what sort of figure moved against this background? Alas, form and features are for ever unknown! Was Squire Chalcot a stout, red-faced, jovial, hunting Squire, as some of his possessions seem to indicate? That punch-bowl, with its memories of many a convivial evening of auld langsyne; the 'hawk's hood and bells,' which hang with the 'silver spurs' in the hall; the 'long guns' and 'fowling-guns;' the 'cross-bow,' and 'twenty-six ox hunting-horns.' We would rather picture him of spare form, with the refined and clearly cut features, keen intelligent expression, and dark eyes, contrasting with the white powdered head, which often please us in old miniatures. Of course he wore a wig, and certainly had a large stock on hand, or carefully preserved his old ones, as we read of 'seven wigs in a box.' His wardrobe contained much gay attire; indeed, he was something of a dandy—the 'Compleat Beau' was one of his books—and no doubt on suitable occasions appeared to no small advantage in his 'blue silk waistcoat

wrought with gold; small scarlet cloak, silver shoe and knee buckles, and glittering shirt-buttons with diamonds. One of the four diamond rings enumerated adorned the hand holding one of many snuff-boxes—tortoiseshell for common use; one with a 'whistle' on it to call his dogs; several of silver and mother-of-pearl; and more than one of gold, with his arms engraved thereon.

But probably Squire Chalcot was more at home when, in his sober brown clothes and skull-cap, he sat in his library, with no gay colouring or handsome distinctive binding to give each book a face of its own; rows of dingy brown calf-skins, or heavy board-bound volumes, lined the shelves, hardly distinguishable but in size from each other; the sole brightness, their occasional red or mottled edges, or brass clasps. Nearly every noted author was represented. Plays abounded, from Ben Jonson and the dramatists of Charles II., to the 'Post Boy Robbd.' A wide range of history was embraced, from Josephus to 'An Essay on the Late Queen;' including the very popular Roman and English Histories of Echard. How fresh and new-looking the 'Spectators' and 'Tatlers,' 'Prior's Poems' and Dryden's 'Virgil.' Seated in his arm-chair, the Squire would take a 'Voyage to America,' a 'Journey to Naples,' or visit Russia with Tolande; while maps and geographical works showed his acquaintance with other countries besides his own. Classical authors not omitted; nor works on astronomy, philosophy, and mathematics wanting. The 'Florist,' and numerous volumes on gardening, in English, French, and Dutch, speak of country pursuits, as do the 'Game Laws' and 'Art of Agriculture.' The many books on 'Physick' prove our good Squire had paid that subject no small attention—perhaps from the remoteness of medical aid; and well-thumbed was Culpepper's 'Dispensatory.' That he was a good Churchman, there seems no doubt; Burnet, Atterbury, Tillotson, Sherlock, Barrow, Hopkins, that line of famous divines, had all contributed sermons and books of devotion, of which there was a collection so extensive that it might be imagined the library of some clerical relative had descended to him. For lighter reading, there was 'Gulliver's Travels,' and Sir Roger L'Estrange's 'Fables.' Mention also made of a silver box full of coins, and a 'gilt medal of William and Mary in a shagreen case.'

And is there *no* tinge of romance about this lonely old place? no sign that bright joyous days were once the lot of its inhabitants? no traces of *woman's* presence? Yes; though invisible to others, those aged eyes see a fair shadowy form gliding through the quiet rooms; and in his ear echoes a gentle voice, and laughter and sweet singing; for deep in the secret recesses of Squire Chalcot's heart, ever green is the memory of her whom he has lost—his wife. Up-stairs, in the 'gilt leather box,' are put carefully away, as precious treasures, things that belonged to her: 'an amber egg' and a 'heart set with diamonds and small garnets'—lovers' gifts of long years ago. Her diamond rings and earrings, her 'girdle buckle,' set with the like precious stones, and many other 'trifles' in a 'small velvet trunk,' are all as tenderly laid aside as Dr Johnson placed his wife's wedding-ring in the little round box

among the cotton-wool. There on the spinet still lies the 'parcel of songs' she used to sing. The tiny 'scissors in the old silver case' lie useless, as they have for years. Those 'embroidered sweet bags' have still a lingering faint perfume. Those dainty 'mother-of-pearl spoons with silver handles' must surely have been a bridal gift, matching the small 'blue and white tea-dishes' and chocolate cups. How we long to gaze on her 'picture' in the shagreen case! Those shagreen cases and little antique boxes! how they speak of the far-off past; how vividly they recall those long departed ones, to whom their ancient-looking exterior brought thrilling memories, who kept their treasures therein, or took the sparkling jewels from the now faded satin cushions, to deck themselves with joyous youthful glee for some gay assembly or county gathering, or some 'rout' or ball in the rarely visited Metropolis. Let us hope this gentle lady never fastened her 'pearl necklace' with an aching heart, although too often

Pining cares in rich brocades are drest,
And diamonds glitter on an anxious breast.

Folded away in presses and cupboards, all lavender and woodruff scented, are the dresses once worn by Squire Chalcot's wife—her 'black lace hood,' recalling sweet old Mrs Delany's face; and if health's own cunning hand had painted the rose and lily of her cheeks, how must her husband have admired her in her 'green tippet with silver fringe,' or in her 'blue tabby suit.' But the 'red and white gown lined with red,' her 'scarlet silk night gown' (evening dress), and the prevalence of that hue in her wardrobe, seem to point to dark hair and soft brown eyes. How bewitchingly becoming must have been the 'scarlet long cloak and hood,' when, seated behind her husband on the 'plush pillion cover,' now mouldering in the lumber-room, she travelled over hill and dale, on the rare occasions of leaving home, her trunks following on horses laden with 'pack-saddles' and 'panniers,' suggestive of rutty roads deep in mire in those secluded country parts. On Sunday, she picked her way to the neighbouring church, carrying a 'wrought Common Prayer Book,' and 'umbrello,' then destined solely for feminine use; and her 'brocaded mantle' and 'scarlet feather muff' would attract many eyes to the 'Squire's pew.' She would not much trouble the grave books in her husband's library, but content herself with a few favourites—'Country Dances,' the 'Lady's Delight,' the 'Royal Cookery and Receipt Books,' the 'Compleat Housewife,' 'Lady Rich's Closet,' and the 'Common Christian Spelling Book;' 'Thomas à Kempis' and the 'Pilgrim's Progress,' doubtless enriched by the quaintest woodcuts, not being absent from her little store of literary treasures.

And one other shadowy figure haunts the old house—that of a little child. Few are the signs of its presence—the earliest perhaps that volume, 'Instructions to a Son.' But the little son was never to receive tender lessons from a father's lips. A 'coral,' a 'child's gown lined with green,' a 'parcel of silver toys,' tell the tale of the joy and hope that once had been, and then passed away for ever.

Farewell to thee, old Hall, with all thy associations! Faint and shadowy as are the images

which flash upon our inner eye as we think of thee, who can say how near they may be to the truth—the *real* memory of 'what has been, and never more can be!'

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

CHAPTER XXXVIII.—HIS FEET WERE IN THE PRIMROSE WAY, AND HE HAD NOT THE HEART TO LEAVE IT.

I HAVE omitted to tell of an encounter between Val and Gerard, in which Val received as many and as hearty thanks for the service he had rendered as the most exigent of men could have expected. Gerard took the restoration of the money of his friend almost as if it had been a gift. He associated the recovery of love, fortune, and happiness with Val Strange, and longed for an opportunity to show his good-will to his chance benefactor. On his side, the long-standing friendship between them rose to white-heat, and stayed there, for Gerard's enthusiasms were neither easily excited nor quick to cool. In the expressions of his regard and affection, he did not seem altogether gracious—feeling it hard to speak out where he felt so keenly. He blundered through with interjectory ejaculations of 'Old fellow' and 'Old man,' the rough clumsy amity touching Val to the quick all the while, knowing what he had meditated against his friend's peace.

'I owe you more than the money, old man,' the grateful recipient of new fortune had told him. 'You know.' That was all he could say on that matter; but the blush on his honest face and the ashamed tenderness of his eyes, were eloquent even to his rival. Val of course pooh-poohed the notion of gratitude.

'My dear Gerard,' he had answered, 'you owe me nothing.' (He knew well enough what Gerard owed him.) 'You don't want to insult me by supposing that I might have bargained with you for the papers.'

That was so ridiculous, that even in the tremor of his gratitude Gerard had burst into a great shout of laughter at it, and had struck a jovial hand in Val's and gripped him hard.

As he lay in the heather after Gerard's departure, the remembrance of this scene forced itself upon him. 'He has got the money, hang him!' said Val moodily. 'If I hadn't been so ridiculously Quixotic and punctilious about it, I might have saved myself this humiliation; I might have saved Constance from the talk of every old tabby in the county, and everything would have been open and above-board.' He began to think somewhat bitterly and angrily of Gerard, and to feel that his hitherto successful rival stood somewhat unduly in his way. It is the most natural thing in the world to hate a man if you intend to injure him. In such a case, hatred is a sort of spiritual corn. If you allow your boots to pinch your toes, nature protects them—and grows corns. If you propose to pinch your soul, by damaging a man who never harmed you, your moral nature protects itself by a hatred. And in each case the protection is a source of considerable discomfort. 'He has got the money,' said Val again; 'confound him! That ought to be enough for him. It was a piece of amazing luck to get it, and he

may be satisfied with what he has. And what right'—and here Val began to think himself on stronger ground—'what right has he to wreck a woman's life?' He began, on the strength of that reflection, to feel himself virtuous. And he had at least the assurance from Constance's own lips that she loved him. To marry another man in such circumstances would be—he scarcely cared to characterise it with Constance in his mind. And so, by steps almost imperceptible, the unhappy Val went downwards towards hatred and dissimulation, and justified himself as he went.

Mr Lumby was not long at the picnic, being still a little weak in body as in mind. It was one of the pleasant characteristics of Lumby Hall that nearly all the servants were old family belongings. The parlour-maid, for instance, was the daughter of a coachman and a cook who had made a match of it, and retired from servitude at the Hall after growing up there from stable-boy and kitchen-maid. The present coachman had been stable-boy; the butler had been pantry-boy; the footman had been a page in the old house. All the servants were held by ties of old association to the place, and one or two of them had felt the triumph of the rehabilitation of the family as though it had been a matter personal to themselves. One of these attached old servitors gave Mr Lumby his arm as they walked down the gentle slope of sward which led from the Welbeck Hollow to the lower meadows. There the carriage waited, and with Milly by his side, Mr Lumby drove away. The young people kept the thing going to a late hour. On the tombstone of the poor princess, a great bonfire was lighted as the shades of evening fell; the trees round the beautiful little circle were stuck full of Chinese lanterns; the band played, and the guests danced and made love, and otherwise enjoyed themselves. There were seniors enough present for the preservation of the proprieties, and not enough to damp the hearty hilarity of the time. Gerard, when everything was over, surrendered Constance to Reginald's care, and drove his mother home. To his surprise, the old man was sitting up to receive them, and in answer to remonstrances, declared that he felt well and strong. He had insisted on re-hearing from Milly the whole story of the recovery of the lost papers, and had grasped it more clearly than before, and now he was quite full of the approaching wedding.

'Gerard, my lad,' he said with feeble cheerfulness, 'you must have a bachelor party before you are married. I had a bachelor party. You must ask Valentine Strange. We owe everything to Valentine Strange, and I always liked him. I was always very friendly with his father and his uncle in their day. We must have Valentine Strange.'

Gerard and his mother were both so happy in the old man's recovery that festivity seemed natural to them. And why should not Gerard give a party to his bachelor friends before he finally left their circle and became a Benedict? It befell that Val received an invitation to that festival within eight-and-forty hours of his interview with Constance, and that it came by the post which bore to him the first letter he had ever received from her. The wedding was

already fixed for the first of July, and Gerard's farewell to bachelorhood was naturally fixed for the preceding evening, the thirtieth of June. And here was the month already.

On the morning that these two missives arrived, Val had received an unusually large batch of letters. His hope of hearing from Constance had risen by this time to exasperation, and he ran feverishly through the bundle in search of a lady's handwriting. In his haste, he passed two epistles as one, and Gerard's invitation was among the first letters he opened. He glared over it, and felt stricken. Old Lumby had written a postscript to it with his own shaky hand. 'Your father and your uncle,' he said, 'were dear friends of mine. You must come to my son's party.' He had signed this brief and shaky message, 'Your grateful servant.' The Stranges were not without their debt to the Lumby, Val remembered; and whatever happened did but seem to make the enterprise he was bent on look darker. He was none the less bent upon it; but he rebelled, naturally enough, against the gathering host of circumstances which made him feel criminal. His was a mission of knight-errantry. He was going to save Constance from a life-long slavery and misery; and for a knight-errant to have his conscience throwing mud at him as though he were a thief, was decidedly unpleasant. The almost piteous gratitude of the broken old man hurt him, and appealed pathetically against his purpose.

'I shall have to tread on the old man, to get at her,' he thought, and he began to dislike the old man for lying there to be trodden on. Why would people get in a knight-errant's way? A knight-errant prancing along among primroses to rescue his appointed imprisoned damsel, had a right to better treatment, surely. She didn't love the fellow. She loved *him*, Val Strange. And yet, here were people blocking his road to her, and insisting on being injured by pure justice.

But at last Val discovered Constance's letter. He did not know her handwriting, but he knew the crest on the envelope, and he tore the missive open with trembling fingers, and read this:

DEAR MR STRANGE—We have both been foolish. I appeal to your honour. Allow me to forget.—Yours truly, CONSTANCE JOLLY.

Now, this of course was absolutely maddening, and in the circumstances, the recipient felt himself justified in the employment of a good deal of strong language. Val was a gentleman, and by all rules of courtesy, a gentleman is forbidden to swear over a lady's letter. But Val gave way, and raged, and then sat down crushed for a minute, but recovering himself, began to cast about in thought for a means of untying this knot. He felt the delicacy of Constance's position; he began, even in a minute or two, to see how well this coyness became her, and to feel that he would be very much worse than unheroic if, because of such a check as this, he drew back from his enterprise. So he caught up a pen, drew a sheet of paper to him, and began to write. Words came easily, and he filled three or four pages with protestations.

'No,' he said suddenly; 'expenditure of words in a case like this is waste of power.' So he

wrote simply: 'We love each other, and I will not surrender you.' He initialed that Caesar-like despatch, and having inclosed it in an envelope, was about to address it, when it suddenly occurred to him that his handwriting would be known, and that some inquiry might be created by it. He tried to feign a lady's hand; but even to his own eye the fraud was too transparent to deceive anybody. He set his wits to work to find a way through this difficulty, and after a minute or two of thought, he saw it. He looked at his watch, consulted a time-table, rang the bell, and ordered the dog-cart for the railway station. Driving thither, he took train for Bristol, desperate with impatience on the journey. Arrived, he took a hansom, and drove to an hotel he knew, a quiet and retired house with an old-fashioned clientèle. His uncle had been wont to stop there, and Val was known. He ordered luncheon, and made a feint of eating, and descended for a chat with the landlady. 'By the way,' he said casually, 'did my maiden aunt ever stay here?' The talk had been going on for some time, and this query was dropped with considerable artfulness.

'I didn't know you had a maiden aunt, Mr Strange,' said the landlady.

'Didn't know I had a maiden aunt?' said Val. 'Nonsense!'

'Upon my word, I didn't,' returned the landlady, laughing. 'Why didn't she get married?'

'That's not my business, Mrs Oakley,' said Val lightly. 'But'—drawing the envelope from his pocket—'I have a little joke for her here. I don't want her to know from whom it comes. Will you address it for me?'

'Valentine's Day has gone by, Mr Valentine,' said the landlady. 'I hope you're not going to plague her.'

'Not at all,' said Val. 'I think I'm going to please her. Do address it. She won't know your handwriting, and of course she would know mine.'

The landlady took the envelope, and sitting down, dipped her pen in the ink. 'Tell me the address,' she said. Val gave Constance's address, and the landlady wrote it flowingly.

'Thank you,' said Val. 'And now, give me a postage-stamp, if you please.' He stamped the letter, and dropped it into the post-box in the hotel lobby. 'That will pass unsuspected,' he said to himself; and after a little further talk, designed to cover his retreat, he drove back to the station, and turned up at Brierham in time for dinner. A day or two went by, how heavily and monotonously you may guess; and Constance, struggling with herself, refused to be drawn into a correspondence fraught with so much danger. Outside the magnetic influences of Val's presence, she could control herself, and could call pride and honour to her aid. During this time, Gerard experienced curious treatment at her hands. She was languid and cold at one moment, and warm and eager the next; and he, being without the key to the puzzle, was perplexed by the extraordinary variations of her manner. Constance tried hard to compel herself to some tenderness towards Gerard which should seem to herself to commit her to him irrevocably, and this struggle naturally bred a reaction of languid coyness.

This also in its turn re-acted, and in her self-reproach she was once or twice amazingly sweet and tender to him, and looked at him with such eyes, that he could read nothing but love in them. His own willingness to read that sweet message helped the deceit; and his constant patience under her coldness, his simple manly loyalty, and the downright sincerity of his worship, were not without their effect upon her.

No answer coming to his Caesar-like despatch, Val began to grow nervous about it, and to fear that he had overdone authority. And all this time the fatal day was drawing nearer, and Reginald's knowledge forbade Val the house, or he would have gone thither and made an opportunity for seeing her. This being out of the question, he wrote a long letter of appeal and protest, and putting the old ruse in action through a new medium this time, again had it forwarded under a female hand. Constance shed many bitter tears above the lines he had penned; but she kept a resolute silence. Some anger began to rise in her heart at his persistency, even whilst she valued it as a proof of the love she prized so dearly, and felt to be so disloyal. But everything was binding her closer and closer to her own spoken bond with Gerard. His parents' affection, the general understanding that the marriage was settled, the very imminence of the ceremony itself, the suffering Gerard and his people had already undergone, the congratulations of her friends on her lover's recovery of his old station, and the renewal of the match—she felt powerless to struggle against all these accumulated influences. And so, Val began to anger her because he had power to pain her. He, meanwhile, unconscious of the influences which moulded her conduct, or weighing them imperfectly, sat in the shadow of his own egotism, by this time grown monstrous, and in its gloom saw nothing but itself. Constance's marriage with Gerard could be nothing, to his mind, but a hideous and shameful sacrifice, and at all hazards he was ready to stop it. But how? The days went on, and he was powerless, and to add to his miseries, Gerard came over a week before the date appointed for the wedding, and seeing how Val had lost his old cheerfulness and jollity, insisted upon his going over to Lumby Hall, and staying there with the guests who had already begun to arrive in view of the impending ceremony.

'So be it,' said Val at length, overborne by Gerard's reiterated friendly pressure. He was kindly and gentle by nature, but he was half-murderous in his feelings towards this blundering genial happy rival, who thus insisted on flouting his happiness in his face. Gerard had driven over; and nothing would satisfy him but that Val should at once drive back with him, and take up his abode at Lumby Hall until the wedding. The other accepted this programme in desperation, and gave orders that the necessary things should be packed at once. Perhaps even this move, mad as it appeared, might lead to something. The two young fellows drove from Brierham to Lumby Hall together; the one all joy and friendship, the other all despair and hatred, which he dared not show. To Val's surprise, Hiram Search received him. He had the keenest memory for faces, and knew him at

once. The circumstances in which he and the Yankee adventurer had met and parted were not altogether soothing to his self-respect, and though under ordinary conditions he would have forgotten and forgiven, he was so tender now, that even so slight a matter as this made him sore.

'You have met Mr Strange once before—eh, Search?' said Gerard, who was in high good spirits.

'I remember the fellow,' said Val haughtily, neither knowing nor caring that he renewed the disagreeable impression he had at first sight created. Why should he care, whatever Hiram or anybody like him might think or feel? It was his ordinary habit to be courteous to all men, and his misfortune that he met Hiram in this unusual and abnormal mood.

'Look after Mr Strange,' said Gerard; 'there's a good fellow.' Hiram did not care to *valet* Mr Strange, and this was the first disagreeable he had encountered since coming to Lumby Hall. But he obeyed nevertheless; and having seen Val's belongings taken up-stairs, began to unpack his portmanteau, when out fell a large envelope with exceedingly frayed edges. Across this envelope were written in characters of unusual clearness, these words: 'Thy grace being gained, cures all disgrace in me.' Hiram saw them, and thought nothing of them; but catching up the envelope, a portrait slipped out of it. He had seen Constance more than once, and the portrait was too true to be mistaken. What brought Mr Strange with a portrait of Gerard Lumby's sweetheart? And what was the meaning of the inscription on the envelope: 'Thy grace being gained, cures all disgrace in me?' Hiram was unfavourably impressed with Mr Strange, and was ready to believe evil of him. This little event of the photograph affected him, therefore, somewhat unduly.

And now, as the least imaginative of men may fancy, Val's position began to be unbearable. Any further approach to Constance was impossible; and though she had confessed that she loved him, the confession seemed only to have set her apart from him the more determinedly. At Lumby Hall he had almost as much freedom as he would have found at home, and in the after-dinner dusk he used to absent himself from the jovial party in the smoking-room, and prow round Daffin Head, and stare at the lights in the house, feeling like the Peri who at the gate of Paradise stood disconsolate. One afternoon, when the marriage had grown so perilously near that his head swam and his heart failed to think of it, he wandered on the customary way, hoping, in spite of despair, that some avenue yet might open, when a trim little figure came tripping along the country road, and he recognised a late fellow-passenger, the girl he had befriended at Southampton. She knew him, and made him an odd little obeisance, half nod, half courtesy; and he seeing that she came away from the Grange, seized eagerly at the poor straw of hope her presence afforded.

'Good afternoon,' he said awkwardly. 'I think I remember you.' She repeated the compromised obeisance, and smiled and blushed with plea-

sure. 'You don't live in this part of the country, surely?'

'I am Miss Jolly's maid at the Grange, now,' said little Mary innocently. Val's heart gave a great leap, and his eyes flashed; but he controlled himself.

'Oh,' said Val; 'and how did you come to be there?'

Mary blushing informed him that Mr Search had recommended her to Mr Lumby.

'Will you do me a little favour?' asked Val with as little agitation outwardly as though the favour had been the smallest in the world.

'If I can, sir,' said little Mary. She was ready to fly to serve him.

'I want you to meet me at the gate of the Grange in an hour and a half. That will be ten o'clock. Will you give a note to Miss Jolly, for me, if I bring it then?'

'O yes, sir, with pleasure,' said Mary.

'I don't want anybody else to see it,' said Val. 'Nobody else must know of it. Now can I trust you to be discreet?' Mary promised the utmost discretion; and Val sped back to the Hall, and wrote his last appeal, begging Constance to meet him, if but for a moment, to appoint her own time and place, and give him but a word.

Round the foot of Welbeck Head, across the little bay beyond, and up to the Grange, was a very pretty bit of rustic walk, and Mr Search, who was not without an eye for nature, strolled there in the cool, with his hat a good deal on one side, and a cigar between his teeth. Val passed him swiftly, and was a little savage to see him there, without being conscious of any very precise reason for anger. Hiram, unreasonably angry and unreasonably suspicious, continued walking, to see what took him in the direction of the Grange. The Yankee was, as times go, an honourable man, and he did not care to dog anybody; but he excused himself—he was walking that way already before Val passed him. 'There's no call on me to turn,' he said, 'unless I've got a mind to.' Before the gate of the Grange, the dark figure ahead of him seemed to pause for a second, but for a second only. 'If he comes back this way,' said the guilty Hiram, 'he'll think I've been spying on him;' and deviating from the road, he strolled in the faint misty moonlight across the fields, accusing himself somewhat in his thoughts for having suspected his employer's friend.

But Val in that momentary pause at the gate had thrust the note into Mary's hands, with just two or three hasty whispered words: 'Let no one see it. I will wait for an answer.' The maid carried the note to her mistress, who was in her own room. Constance read it, and could not resist the temptation its summons brought her. She muffled herself hastily in a gray shawl, stole tremulously down-stairs, and found the dining-room deserted, with its windows open on the lawn. She stepped out into the night, passed round the house silently like a ghost, and sped with a heart that sounded an impetuous alarm, along the darkened drive. Val, who had marked that he was followed, had seen Hiram off the field, and was by this time back at the gate again, standing in the shadow of the trees within the drive.

'Constance!' he whispered. She stopped short, and he approached her and folded her in his arms. 'My love, my love!' he murmured. 'My heart was breaking to see you. Why were you so cruel? Why did you leave me unanswered?' And when she would have answered him, he stopped her lips with kisses. 'You love me,' he murmured again. 'Why should you break two hearts, and blight two lives? I know you love me. I will not let you go.' This masterful and peremptory wooing is not the way with all women; but if the right man adopts it, it rarely fails. And Constance in his arms found the urgent voices of duty and honour suddenly gone dumb, and her tired heart at rest. 'Here,' she thought, 'is my place after all.'

'It is too late to go back,' said Val. 'You love me, and you can never be happy without me. And I will not live or try to live without you.' She began to cry and to cling to him, and to protest—she had been so unhappy—so unhappy. How was a poor girl to know where duty lay? It was terrible to think of marrying Gerard. She told Val as much, and he kissed her anew with passionate triumph. Should she write to him, and say so, even now in these last days of hope? she asked. But her father wished the match, and her brother and her aunt were favourable to it. She would have to endure so much shame in breaking it off at this late hour. What *could* be done?

Even yet it was not too late to pay some little tribute to honour. Even yet, Val might have played the man, and have told Gerard the plain truth, and faced his indignation and his misery. But his feet were in the 'Primrose Way,' and he had not the heart to leave it.

(To be continued.)

SEA-FARE.

In these days of monster steamships, quick passages, and luxurious ocean-travel, we are rather apt to forget how short a time has elapsed since weary voyages in sailing-ships were the only means of communication with distant lands, and with what avidity nearly every recent discovery in art, science, or manufacture has been seized upon and made instrumental in some way or other towards effecting this contrast—possibly a greater one than any other phase of progress can show, and rivalling even the change from stage-coaches to railways.

And not less than the contrast in speed is the revolution which has taken place in the mode of life on board. But a comparatively few years ago, every one who ventured on a voyage to a foreign shore, whether he were a peer of the realm or a denizen of the fore-castle, knew that for weeks or months, as the case might be, he must put up with an unvaried diet of salt beef and salt pork, accompanied by hard biscuit or dried peas, with a pitiful dole of water daily, and the ever-haunting possibility of supplies running short. Now, the gentleman who pays for a trip of three thousand miles, grumbles if his wine be not iced, and demands daily three

good and abundant meals of fresh meat and vegetables.

In the course of this paper, it is proposed to offer to the reader some authentic statistics concerning the commissariat department alone of a large ocean-going steamship. And in considering these matters, two points strike the attention rather forcibly—the perfection and immense experience shown in the system by which such a ship can be victualled so liberally yet so exactly as to prevent loss by superfluity, or embarrassment through insufficiency; and the marvellous cheapness which competition between great lines has brought about. The discontented passenger who complains that some small item in his dinner of many courses is not to his taste, seldom reflects on the vast forethought which must have been exercised on his behalf down to the smallest minutia—for there are no shops at sea wherein to purchase any little thing that may have been forgotten—or on the fact that his passage-money is probably less than the amount which he would have to pay for living at a good hotel with an inferior table for the time equal to the duration of his journey.

The following details have been culled not so much from the very largest steamers, as from those of the best class which take long voyages and are mainly provisioned at the outset. Thus they do not apply to the huge North Atlantic boats, with their six and eight day passages, or to teeming emigrant vessels; but have been averaged principally from the fleets of the Peninsular and Oriental (running to the East), Royal Mail (West Indies and Brazil), Orient (Australia), Pacific Steam Navigation (both coasts of South America), Messageries Maritimes (East, West, and South), and Union (Cape of Good Hope) Companies. It must be remembered, however, that they all vary, for many reasons. Some carry more of one thing and less of another. Some Companies make their own ice on board, and provide themselves with dead-meat instead of live-stock—a very important item. Some take a sufficiency of this, that, or the other thing at starting; while others will renew those stores at their different ports of call, according to the local cost of the articles and the facilities on board for storing them; while the same ship may be differently stocked for different voyages, influenced by the time of year and the probabilities of a greater or smaller number of passengers. In no case is the quantity stated exaggerated beyond the actual figures which some vessels' provedore accounts present—possibly, indeed, falling short of others. It will be readily understood that the major part of the substances mentioned are for the use of the first-class passengers; since those which have been selected at hazard as illustrative of the subject, are rather such as indicate the luxurious profusion and completeness of arrangements, than what may be termed the necessities of equipment.

For instance, a landsman might feel some interest in learning that such a ship as the representative ideal whose commissariat we are about to glance at, would, if set upright on her stern, project her bowsprit above the cross on the top of St Paul's Cathedral; that her boatswain's stores would include one ton of paint, five tons of spare rope, and five hundred yards of canvas; and that two thousand gallons of oil are required to lubricate her engines for three months; but the fact of her carrying a hundredweight of pepper for consumption each voyage, will give him a better idea of what we wish to convey.

A passenger steamer of four or five thousand tons may have on board seven hundred souls, or more. Two hundred, say, of these will be saloon passengers, a very few second-class, and probably three hundred third-class or steerage passengers. Her company will number something above one hundred and fifty, of whom more than half will be servants, apart from the crew-proper; eight or ten cooks of various degrees—the *chef* generally a Frenchman, and usually one at least of each nationality likely to be included among the passengers—two bakers, a confectioner, three butchers, and about sixty stewards and waiters, English and foreign. Her voyage 'there and back' will occupy from eight to fifteen weeks; and her stores, renewable each trip, are worth many thousands of pounds.

We shall want a parting glass with the friends who have come to see us off at starting—and possibly a little brandy not long after—so we had better begin to make one or two rough notes at the bar. Here and in the wine-rooms below, we shall find twenty-five thousand bottles of beer, four thousand bottles of spirits, fifteen hundred bottles of champagne, five thousand of other wines—besides a large quantity, in the wood, of some light claret or Figuera, which is frequently supplied gratis at breakfast and dinner—and ten thousand bottles of various aerated waters. One thousand lemons are suggestive; but though eighty tons of ice—where there is no ice-making machine—may seem conducive to unlimited sherry-cobblers and other 'long drinks,' it must be borne in mind that the chief functions of the ice-house are to cool the drinking-water in the tropics and preserve fresh meat, fish, and fruit. Passing to more innocent beverages, milk *ad libitum* appears to be guaranteed by one thousand tins of the condensed article, and five hundred gallons of the fluid 'direct from the cow,' kept sweet in the refrigerator. 'A milch cow on board' makes a good line in a Company's advertisement, and is calculated to attract those who contemplate travelling with a family of children. But where there are half a thousand people, the presence of such an animal must be soothing rather to the imagination of the milk-drinker, than calculated to affect the quality of the consumed milk to any appreciable extent. Nevertheless, a cow is attached to most passenger steamboats. One thousand pounds of tea and eighteen hundred pounds of coffee, sweetened with eight thousand pounds of sugar, are comfortable items for those who relish the cheering cup; while twenty thousand gallons of fresh water, brought from the shore, and stored in huge tanks in the

hold, with a daily supply of one thousand gallons in addition from the condensers, is a matter of importance both to the inner and outer man.

Now for a few of the eatables, at random. Three thousand five hundred pounds of butter; three thousand hams; sixteen hundred pounds of saloon biscuits—Huntley and Palmer's, &c.—not those supplied to the crew; one thousand pounds of 'dessert stores'—muscatels, almonds, figs, &c., exclusive of fresh fruits, which are taken in at every port; fifteen hundred pounds of jams and jellies; six thousand pounds of tinned meats; one thousand pounds of dried beans, and three thousand six hundred pounds of rice; five thousand pounds of onions; forty tons of potatoes; sixty thousand pounds of flour; and twenty thousand eggs. Fresh vegetables, dead-meat, and live bullocks, sheep, pigs, geese, turkeys, guinea-birds, ducks, fowls, fish, and casual game, are generally supplied at each port of call, or replenished at the further end of the journey, so that it is difficult to obtain complete estimates of them. Perhaps two dozen bullocks and sixty sheep would be a fair average for the whole voyage, and the rest may be inferred in proportion. The writer has known five-and-twenty fowls sacrificed in a single day to make chicken-broth. We therefore shan't starve, even if we are a day or two behind time, which is considered a great enormity now.

The mention of chicken-broth suggests seasickness, and sea-sickness conjures up the doctor, and with the doctor is associated medicine. His dispensary is as well furnished with drugs as any chemist's shop in a country town; and when we observe that, among other things, it contains twelve ounces of quinine, four gallons of black-draught, twenty pounds of Seidlitz powders, a gallon of castor-oil, and half a hundredweight of Epsom salts, it is evident that if the sick people do not get well, it is from no lack of physic.

Four thousand sheets, two thousand blankets, eight thousand towels, two thousand pounds of various soaps, two thousand pounds of candles—except in those vessels which are fitted with the electric light—sixteen hundred knives, two thousand two hundred plates, nine hundred cups and saucers, three thousand glasses—fancy what a handsome income the amount represented by annual loss from breakage would be!—eight hundred table-cloths, two thousand glass-cloths—all these are figures exhibited in the provisioning of one ship alone. Think what they would mount up to when multiplied by the number of ships in each Company's fleet, and then try to realise the fact that this department constitutes only one, and by no means the greatest, of their incidental expenses.

A large quantity of rum was carried until recently in every vessel, rations of that spirit being served out to the ship's company daily, as agreed upon in the articles. This custom has lately been abolished in most of the mercantile marine services, with great advantage both to the owners and their employés. But though mercantile marine Jack's grog is stopped, he can still enjoy his 'baccy, and half a ton of the pleasant weed is recognised as part of the outfit before sailing from dock.

It will be seen that not one tithe part of the

commissariat stores requisite for a big liner have been enumerated—merely a few extracts of the things in daily use, as specimens. Their very bulk brings further necessities; for example, the amount of hay, corn, and other food for the live-stock would form no trifling consideration; and when we remember that every bottle and glass, in use, must have a separate niche or compartment to insure its safety in bad weather; that every cup in service hangs on a special hook; and that, in addition to stores passengers and crew, such a steamer would carry three thousand tons of cargo, and perhaps two thousand, or two thousand five hundred tons of coal—remembering, too, that in the middle she is filled by her engines, which cut an enormous slice out of her hull, and that saloons, ladies' cabin, smoking-room, bathrooms, 'two pianos and an organ,' 'library of six hundred volumes,' &c., all imply a lot of waste ground—the question which comes uppermost in one's mind is, Where do they put it all? And indeed it is marvellous to see how the stowage is contrived; not a cubic inch of room is wasted, but has its own proper occupant. The worthy old adage of 'A place for everything, and everything in its place,' might here be expanded into, 'A place for something everywhere, and something in every place.' The art of condensation of materials and economy of space has probably been studied nowhere to such an extent as on board ship, perforce of necessity, and is carried out even more rigidly in this era of 'floating towns' than in the days of smaller craft. So much attention has now to be paid to decoration, elegance of fittings, and spaciousness of apartments and promenades, that available stowage-room is comparatively more limited than ever. Consequently, the builders' ingenuity is racked to the utmost, and we find every mirror, sofa, and panel masking a locker or some other appliance of stern utility.

Looking at the enormous daily consumption of food which these statistics reveal, it is natural to suppose that the quicker the ship can be hurried to her destination, the more profitable it will be for the owners. Such, however, is not the case. A large steamer's speed averages, let us say, thirteen knots per hour on a daily quantum of from fifty to eighty tons of coal. But increase and decrease of speed—other things being equal—is out of all ratio with the coals burnt; thirty tons per diem would produce ten knots an hour, while fifteen knots might require a hundred tons or more. And after all, coal is the grand item of cost in the working of a steamer. Most Companies reckon that, taking into account the expense of wharfage at home and abroad, transport, labour and dock dues, but *not* including the loss of the space which they occupy in the vessel, the 'black diamonds' average two pounds per ton in price.

Then what an epitome of wealth must a well-found, well-freighted ship be, as she ploughs her way through the waters, exclusive of her priceless cargo of human lives, or even the possible treasures in specie and diamonds of her bullion-room—not to mention the mails which most of them carry, and which are supposed to rank above all else. When we consider that the vessel herself may have cost one hundred and twenty thousand pounds; her engines fifty thousand pounds

more; and that there are some thousands of tons of precious merchandise, baggage, and coal aboard, her provedore stores, about which we have been wondering, seem but a small matter after all!

THE HELODERM.

A VENOMOUS LIZARD.

SOME time ago a box containing a lizard was sent to the London Zoological Gardens, and on the lid was written: '*The bite of this animal is not poisonous.*' One can well imagine that this information was looked upon as doubly superfluous when the inmate was disclosed, seeing that lizards have always been held as harmless creatures. It was handled freely by those present, and examined with a good deal of attention; for the species was new, and no description of it was to be found in the standard works of reference; and when at last conveyed to the Reptilium, it was taken by the keeper and thrust into a den with little ceremony or precaution. Big lizards of all kinds, however, can inflict nasty bites, and are usually ready to do so when first received; a propensity well recognised by practical naturalists, who soon acquire a knack of handling animals without risk. Furthermore, the creature was lethargic from cold and the effects of its long sea-voyage; possibly, also, from want of food, for it had eaten nothing since it left its native land, Mexico. Luckily, therefore, the lizard did not afford a demonstration of those terrible powers with which it is endowed, before its true nature was recognised. But when Dr Günther, the chief of the Zoological Department at the British Museum, and the best authority on reptiles at the present day, to whom the lizard was submitted for classification, had examined its mouth, he at once pronounced it to be dangerous; and all doubts vanished from the minds of the most incredulous when a frog and a guinea-pig were bitten in quick succession; the former being killed almost instantaneously, while the latter was dead in three minutes.

Heloderma horridum is the technical name which has been bestowed on this lethal saurian. For simplicity's sake we will call it the heloderm. It is a handsome creature, and its general hue and appearance strike the attention at once: rather over a foot in length, with a body as thick as a man's wrist; the ground colour a warm pale yellow, covered with a network pattern of dark brownish lines; the tail large, stumpy, and encircled with double rings; muzzle, black. At first it refused grapes, banana, lettuce, carrot, minced meat, cockroaches, frogs, lizards, slow-worms, mice and rats, all of which were tendered to it for food; it, however, devoured a couple of eggs. Harmless as all other lizards are supposed to be, the mouth of the heloderm reveals a dental arrangement totally at variance with all one's preconceived ideas, *every tooth* appearing to be grooved as in the case of the fangs of poisonous serpents. Furthermore, this irreconcilable lizard holds on to its victim, and works its jaws fiercely and continuously after they are buried in the flesh, as though sending an abundant flow of venomous saliva into the body; thus departing from all rule of procedure among veneniferous serpents on like occasions.

It remains to be seen, however, whether

these grooved teeth are, so to speak, the direct channels for the introduction of a deadly secretion limited to their appendages, as is the case with a snake, or whether they simply effect inoculation of a poisonous matter, disseminated throughout the general saliva or mucus of the mouth by the mere wound they inflict, in the same way that a mad dog communicates hydrophobia by its bite—a process which resembles that of a lancet procuring the absorption of vaccine fluid by its scratch, while the ordinary bite of a venomous snake is rather to be compared to the action of a hypodermic syringe. It is worthy of note, as bearing out both this possibility and the inconsistent character of the heloderm, that it has glands in the *lower* as well as in the upper jaw.

It will be very interesting to learn the natural food of this creature, and such knowledge will probably give us a solution of the mystery—Why is it, and not the other members of the lizard tribe, venomous? Nature bestows nothing wantonly, and there must be a reason for the heloderm's possession of such a secretion—some function of vital import to the possessor. Poisonous snakes are so provided, not—as many people imagine—to enable them to go about doing mischief, but for the simple purpose of obtaining food. Destitute of the constrictive power which distinguishes boas and pythons, they would be no match for the animals which constitute their natural prey, were it not for their venom. But what can a creature, having teeth to bite with, claws to seize and tear with, agility for pursuit, and, it may be, a prehensile tongue, want this extra and seemingly superfluous ammunition for? In other words, upon what has it been intended to feed, to demand such weapons of offence? Certainly, one would say, not upon eggs, fruit, or cabbages, like the iguana; and we find it apparently as perfectly adapted for catching and slaying small mammals and birds as are many undoubtedly harmless lizards of a similar size and formation.

It may be that it will be found to prey upon some powerful animal that requires great holding-power to retain, and which may probably be cold-blooded animals such as snakes. When a venomous serpent which feeds on birds or rats attacks, it strikes a sudden blow, and withdraws. The victim may stagger or flutter away, but is bound to fall within a short distance, where it can be followed and eaten at leisure. But those which devour their own kind, like the coral-snake and hamadryad, seize the serpents which form their meals, and do not again relinquish them—much as our common grass-snake deals with a frog. The reason for this is evident: the poison takes effect so much more slowly in a cold-blooded animal, owing to its defective organisation, and consequent tardiness of the vital processes, that the bitten snake might escape too far to be retrieved if released before it died.

The Indians in Central Mexico are said to pay a superstitious reverence to the heloderm, and to worship it as the incarnation of one of their deities. The writer heard there—the legend obtains much farther south—of a lizard which fights with all venomous snakes from 'antipathy' and other disinterested motives whenever it comes across

them ; but, as a specimen which was brought to me proved to be a common teguexin, and as, furthermore, I was told that the lizard, when accidentally bitten, always runs to a certain shrub, &c., I confess I did not pay much heed to the account. It behoves one, however, to be guarded in ridicule of popular errors for the future, after this distinct triumph of 'vulgar prejudice' over scientific assurance.

BOOK GOSSIP.

HERE is another beautiful volume from the pen of Mr Francis George Heath, entitled *Autumnal Leaves* (London : Sampson Low & Co.). We have before had occasion to notice with approbation the writings of Mr Heath, as he is one of the few whose variety of picturesque description enables them to maintain the interest of the reader through consecutive chapters of scenic word-painting. In this volume Mr Heath gives careful attention not merely to the exquisite tinting, but to the forms and venation, of the more prominent of the leaves whose fading splendour lights up our hedges and woodlands in autumn. The coloured plates of the leaves, given in this volume, are finished with artistic delicacy and grace, and with carefulness and accuracy of draughtsmanship. The frontispiece of bramble-leaves cannot fail to awaken a sense of beauty in any one who has ever, in his roadside walks, marked the beautiful forms and the rich hues of the fading bramble, passing through all the gradations of orange, and red, and russet brown. It is, says our author, the varieties of hue and colour on any single leaf that give the striking character to autumnal foliage, so apparent when it is closely examined. The effect is doubtless due to the manifestations of the preliminary stages of decay ; and yet, in his opinion, it is not strictly decay which produces the picturesque changes of colour in the early stages of what is called leaf discoloration ; at anyrate it is not decay of a kind which, when once commenced, must inevitably lead to a disintegration of parts. Not only can the course and progress of this discoloration be arrested—in the case of most leaves—at any stage, but means may be taken to alter the conditions which are necessary in order to continue, or merge, mere discoloration into actual decay.

The book is divided into two portions. The first is entitled 'Autumn Rambles ;' and the author, in the course of his wanderings round the New Forest and about Brockenhurst, has an opportunity of displaying his singular felicity in describing the more beautiful and picturesque scenery and objects of nature. We have already referred to the coloured drawings which he gives us of bramble-leaves ; here is a word-picture of the same as he saw them in a lane at Brocklehurst : 'For the moment the brambles carry the palm of beauty. The purple of their stems contrasts with their still green leaves, and blends with those leaves which have put on their autumnal tints. On the same bush there are the greenish white of late buds, the pink blush of tardy blossoms, and the green, red, and black colours of autumnal fruit. In the bramble stems, too, there is variety ; for whilst their

prevailing colour is purple, they are, in places, overspread by vermillion hues ; and, where this hue is spread upon the stem, the adjacent foliage is dyed with the same rich colour. Strongly contrasting with the vermillion leaves, are others of bright yellow, approaching gold,* and others of greenish white. Now they are sombre in the hue of green, now flushed with crimson, now green and purple-blotched, but always beautiful.' The second portion of the book deals with the subject proper, 'Autumnal Leaves ;' the several chapters in which the leaves of the oak, the ash, the maple, the elm, the chestnut, and many others, are described, being accompanied by beautifully tinted plates of the leaves themselves. The book will form a delightful autumn companion to such as find pleasure in country rambles ; and the study of it is qualified to lead to a more correct appreciation and distinction of autumn tints, as found on the leaves of particular trees, than the writings of descriptive poets and others at all times evince. Mr Heath's work can scarcely fail to meet with acceptance.

**

It is quite a common remark nowadays, that the age of letter-writing is past. Things certainly move forward in these times with unprecedented speed ; and, what with telegraph wires and newspapers, tidings of all kinds pass so rapidly from place to place, that less is left than ever before for the pen of the private writer. It is true that a first visit to London, or the Highlands of Scotland, or the mountains of Switzerland, may provoke from young folks an outburst of epistolary confidences and gossip ; but this state of feeling is evanescent, and except perhaps in the case of lovers, the written missives that pass from hand to hand gradually become as brief, methodical, and uninteresting as the specimens that are served up in those wonderful 'Ready Letter-writers' that teach us how to address ourselves in writing to 'persons of every degree of rank.' Even the correspondence that passes between literary men is, as a rule, of the most business-like type ; and it is only perhaps among the warm-hearted and gushing aspirants that anything like an interchange of high-flowing sentiment or elaborate expression of opinion is to be found. This state of things is possibly to be regretted ; but nevertheless it exists.

There was, however, a time in which letters were the objects of more care to the writers, and much more precious to the recipients, than now ; hence one of the most attractive features of literary biography in the past has been derived from the letters which the biographer was in general able to give. No doubt much of the correspondence thus given to the world has been found to be tedious and for the most part barren. Even the collected letters of such men as Swift and Pope and Arbuthnot are stiff work, if you sit down and try to read them through. On the other hand, there can hardly be more delightful reading than the letters of Cowper and Scott and Byron, especially if taken in connection with the period of life or special circumstances of the writer that called them forth. English literature is rich in letters ; and we are glad therefore to draw attention to a book just issued, entitled *The British Letter Writers* (Edinburgh : W. P. Nimmo & Co.), compiled by the editor of

English Essayists. The volume, which has all the advantages of good printing and binding, comprises within it letters of the best English writers from the fifteenth century to the present time. The letters are selected with skill and judgment, and besides being chronologically arranged, are introduced by brief and sufficiently concise notices of their respective writers, or of any special circumstance to which the letters may refer. Most readers have spare half-hours, when it is a relief to escape for a little from methodical study; and in such interludes, there are few books that would more delightfully repay perusal than this collection of English letters.

THE MONTH.

SCIENCE AND ARTS.

THE chief scientific event of August was the fifty-second meeting of the British Association. Many people naturally look upon this annual exposition of scientific progress as an opportunity of posting themselves in recent discoveries and new speculations of foremost minds; and we venture to imagine that on the present occasion they will not suffer disappointment. A perusal of the President's Address cannot fail to interest even those unaccustomed to pay attention to scientific matters; for Dr Siemens's remarks are so clear, and bring home to our minds such important considerations concerning our well-being and every-day lives, that they at once claim, as they deserve, careful attention.

Dr Siemens, as is well known, is a great authority on electricity, and we owe to his ingenuity the invention of many important instruments. Hence his words regarding the present position of electrical science, and more particularly the application of this form of energy to lighting and motive-power, will be scanned with greater interest than other portions of his Address. But he had also much to say regarding the future of gas as an illuminant and as a heat-giver, which will not only be of great interest to many, but must carry dismay to the hearts of not a few. He believes electricity will be the light of the future, but maintains that gas will still be largely used as the poor man's friend. But the great future in store for gas will be in connection with it as a heat-giver. Dr Siemens points out that a gas giving vast heating power can be produced at a very cheap rate indeed. He proposes that this gas should be made in the coal-pit or at the pit-bank, and should be distributed throughout the country in place of coal. By this means the heavy railway freight would be saved, the gas Companies as they now exist would be dispensed with; each pound of gas would give us just double the heat of a pound of coal; and more important than all, we should have no smoke. It may be long before these bold speculations are realised; but that they are feasible, no reasonable being who studies Dr Siemens's facts and figures can deny.

A public subscription has been opened by the Lord Mayor of London in aid of a very interesting archaeological work. Until the year 1869, the exact site of the famed Temple of Diana at Ephesus was unknown. At this time, Mr J. Wood, after several years' search, found its

remains far below the present level of the soil. He was for some time aided in his work by government grants, but for some reason or other, these were not renewed; and after a few specimens of the beautiful unearthed sculpture had been secured by the British Museum, the work stopped for want of funds. The present subscription list, opened at the Mansion House, London, is headed by some very influential names; and there is little doubt but that the money required for renewing these interesting excavations will be speedily collected.

Not so many years ago, the man who could boast that he had sailed round the world was regarded as something approaching a hero, and if not exactly on a footing with the renowned Captain Cook, he approached very nearly to that standard of excellence. Things are different nowadays, for anybody with time and money to devote to the object can put a girdle round the earth. The steamship *Ceylon*, owned by the Inter-oceanic Steam-yachting Company, has just returned from such a trip, having been absent from England for just ten months. She carried sixty passengers, who had the opportunity of remaining for some time at each of the important stopping stations. Thus, the first six weeks of the voyage were consumed in visiting the chief Mediterranean ports; after which, by the Suez route, the ship made its way to our Eastern possessions, and then onwards to China and Japan. Next came the Sandwich Islands, and the principal ports on the west coast of South America; the East-coast ports as far as Bahia next claimed attention; and the vessel on its way home called at the Canaries and at Madeira. The distance traversed was altogether thirty-seven thousand miles, the vessel returning in good condition, and reporting a clean bill of health during the voyage. We cannot imagine a more beneficial and enjoyable way of passing a year, for those who have leisure and means, than a trip in the *Ceylon*.

Another voyage, undertaken for very different reasons, has also recently terminated with the most satisfactory results. In June 1881, Mr Leigh Smith set out from Peterhead in the *Eira*, on a voyage of Arctic discovery. The little vessel, with its crew of twenty-five, all told, was sighted during the following month by a Norwegian schooner off the coast of Nova Zembla. Months passed away, and nothing more was heard of the explorers; but they were not forgotten by friends at home. Last June, a Relief Expedition was organised, under the command of Sir Allen Young, and the ship *Hope* set sail on her errand of mercy. The crew of the *Eira* were rescued, and are now in their homes once more. They had lost their vessel, which was nipped in the ice, and were, when found, subsisting on the flesh of the walrus and bear. The scientific results of the expedition were lost with the ill-fated *Eira*; but Mr Leigh Smith's journal of the voyage is saved, and will no doubt soon be in the hands of many readers. This rescue of a ship's crew will form a pleasant episode in the history of Arctic research, a history already far too full of gloom.

Another Arctic expedition has sailed from Copenhagen under the direction of Lieutenant Hovgaard. The objects of this fresh enterprise are—'To ascertain whether Franz-Josef Land

really extends to the neighbouring Cape Chelyuskin; whether the conditions of the current and ice are such that a basis for further exploration can be reached here without too great a risk; and whether the eastern coast of Franz-Josef Land trends to the northward at this point. Lieutenant Hovgaard's ship is a steamer of one hundred and fifty tons, which has been specially strengthened for contact with the ice. It carries a crew of twenty-two including the officers, and takes several sledges and Newfoundland dogs. Besides provisions for twenty-seven months, the vessel is provided with coal enough to give full steam for fifty days.

We have before alluded to the rapid destruction of timber in the United States, where no attempt seems to be made to replace by young trees those which have been felled by the lumbermen. Professor Sargent, of Harvard College, has been engaged in computing the probable time which will elapse before certain kinds of trees become exterminated; and his results will soon be known. It is said that the white pine will be gone in twenty years, and that many other trees must follow in its wake. But there are districts as yet hardly invaded by man where, owing to the liberal rainfall, different kinds of timber grow most luxuriantly. A correspondent of the *Times* lately gave a very interesting account of one of these regions; and he states that the whole of the Pacific coast from the forty-second parallel to the forty-ninth, and beyond, and from the edge of the ocean for about one hundred and twenty-five miles inland, is covered with incomparable timber. In the district of Puget Sound, the principal trees are yellow fir. They grow to an enormous height, and some of them will give squared logs one hundred and twenty-four feet in length. This region gives an average yield of forty thousand feet of timber per acre; and occasionally as much as two hundred thousand feet are found upon a single acre.

A curious but effective method of testing wines in order to determine the amount of astringent matter in them, has lately been devised by M. Girard. Astringent qualities are usually due to a tannic compound called *anotannin*, and closely related to it are several colouring-matters. There is a tendency in these matters to combine with animal tissues, and M. Girard takes advantage of this circumstance. He steeps a few lengths of so-called catgut—the fine white strings of the violinist—in the wine to be tested; and at the expiration of a day or two, the colour and astringent matter is drawn from the liquid. Comparison of cords so treated, with cords which have not been so treated, together with well-known methods of analysis, give the necessary amount of *anotannin* and colouring-matters present in the wine.

Last month we noticed M. Schmeltz's invention for recording the *duration* of rainfall; and since then the particulars of an English invention of a similar kind have been made known; but in this case the pluviometer is superior to that of M. Schmeltz, in so far as it records the *quantity* as well as the duration of rainfall. It is the invention of Mr William Gadd, Civil and Consulting Engineer, Manchester, and is manufactured by Messrs W. H. Bailey & Co., Albion Works, Salford. Mr Gadd's pluviometer

externally resembles a small upright clock-case; and is internally composed of a cylindrical vase, in which is a peculiar float, having attached thereto an upright rod, terminating in a delicate spring pencil or pointer. A drum, on which a suitably prepared diagram is fixed, turns by means of a clock attachment, so that as water enters the vase, a curved line is traced on the sheet, showing the height to which the water attains at any given time. This pluviometer is intended to be placed inside the observatory, and to be connected by means of a pipe with the collector outside. The registration of this instrument has the two great advantages of being constant and automatic.

From the *Edinburgh Evening News*, we learn that the remarkable manner in which the spectroscopic weather forecast communicated to a contemporary at the beginning of September has been verified, deserves the attention of meteorological observers. The statement was to the effect that at the beginning of a certain week the spectroscope showed a remarkable absence of watery vapour lines in the spectrum of skylight; that a directly contrary state of things in the previous week was followed by heavy rains and floods; and that a spell of dry weather might now inferentially be counted on with some little confidence. Fortunately for the farmers, that expectation was realised. Several times since the statement appeared, the sky became overcast, but the clouds invariably cleared away without rain, leaving an expanse of glorious blue such as we too seldom see. It is not for the unscientific to form any positive conclusions as to the value of such a fulfilment of a scientific forecast, but the circumstances are clearly encouraging, and it seems not extravagant to hope that the spectroscope may do for practical meteorology what the methods of observation hitherto followed have as yet failed to do. In the observation recorded, certain solar lines in the spectrum stood out clearly, which had throughout August been almost lost in a 'thicket of terrestrial water-vapour lines.' It is further interesting to notice that the suggested probability of 'rather cold sharp weather' has tallied pretty closely with the facts.

M. Regnard has been making some curious and apparently successful experiments in feeding lambs that have either been left orphans or which have been deserted by their mothers. To most people, milk would seem to be the food best fitted for the purpose; but M. Regnard has brought up his little family of lambs on a very different diet. Blood obtained from the slaughter-houses was dried, pressed, and powdered in a coffee-mill; and mixed with other food, was given in doses of ten to eighty grammes daily. The animals surpassed in weight and size even those lambs which had been nourished by their mothers; and competent judges pronounced them to be the finest specimens they had ever seen. Calves are now being reared on the same plan; and sickly children are said to receive great benefit from the strange food.

Another Frenchman, whose position at the head of a Parisian hospital for infants should give weight to his remarks, advocates most strongly the use of asses' milk for infants deprived of their natural food. He says that he has seen this milk bring about the veritable resuscitation of little

ones; and he maintains that all institutions for the maintenance of new-born children should be provided with arrangements for keeping asses, and also goats. The milk of the goat is not much inferior to that of the ass, provided that the animal has sufficient space to roam about in, and to find its favourite food.

A strange contrast is afforded by the perusal of two papers relating to Agriculture which have lately been published. One is the summary of the Agricultural returns of Great Britain for 1882; and the other paper is the Report of the Canadian Minister of Agriculture. Seven years of bad seasons make the British returns into a very gloomy history; while the Canadian Report breathes nothing but prosperity in the present, and brilliant prospects for the future. The Canadian Minister points to the attention which is being given to the importation from Britain of pedigreed animals; and we see by the statistics given how the old country is being drained of its finest stock to give vigour to the new. It is said that from the late Show at Reading three shiploads of the finest animals went to America; and from all parts of the country come stories of foreigners buying up stock at a price with which home-buyers cannot compete. It may well be said that high prices and increased competition are affecting our agricultural progress.

An interesting relic from Pompeii has just been added to the Naples Museum. It consists of a fresco representing the Judgment of Solomon, and is unique in being the sole picture of a sacred character yet found in the buried city. Mr E. N. Rolfe, who sends to the *Times* a detailed description of the work, tells us that the drawing is poor, but that the colours are bright and in good preservation. The bodies are dwarfed, and out of proportion to the heads. Some think, from this circumstance, that the composition is intended as a caricature; but Mr Rolfe is of opinion that the heads have been exaggerated so as to allow for better facial expression. Beyond this distortion, there is apparently no caricature, the various expressions, from the agony of the real mother to the triumph of the false one, being well delineated.

A new process for treating China-grass and other fibre-producing plants—the invention of M. Favier—was lately shown in London in operation before a number of gentlemen interested in the production or use of fibre. Most of the plants in question are cultivated at long distances from the places where the fibre is prepared for market; and the new process is intended for treating the vegetable matter at the place of its growth. The advantages claimed for this procedure are principally two. In the first place, only fifteen per cent. of the raw material is ultimately utilised in the production of fibre, and therefore the carriage of much useless matter is saved; and in the second place, the fresh material is far more easily treated than that which has dried up during transport. The apparatus is simple in the extreme. It consists of a closed wooden box with a false bottom, under which runs a steam-pipe connected with a boiler. On the occasion referred to, this box was filled with a number of specimens of fibrous plants, obtained from the Botanical Gardens at Kew and Paris. After being sub-

mitted to the action of the steam for twenty minutes, the specimens were found to be ready for further treatment, the epidermis and fibre readily stripping from the wood. The cost of thus rendering the material fit for the mill is only two pounds per ton. The invention will be of great importance not only to the fibre-trade but to many of our colonies, and may still further cheapen the price of paper.

The old idea of making Manchester a port by means of a ship-canal from Liverpool, has been once more revived, and the 'Manchester Tidal Navigation Committee' are now holding an inquiry into the whole subject. The scheme has been considered by many to be visionary; but the same was thought of the Suez Canal and many other projects of an extensive character which have proved successful. The Canal would utilise the channels of the Mersey and the Irwell, and would be about thirty-seven miles in length. It would terminate at Manchester in an immense basin. There is no great engineering difficulty in the way of its accomplishment, the principal question being whether the enormous outlay entailed will bring back a sufficient return to the shareholders.

It has long been known that the Davy Safety-lamp is only safe under certain conditions. If the air in a mine be moving at a rate greater than seven feet per second, the wire-gauze surrounding the wick is no longer impervious; and the outer atmosphere, if of an inflammable nature, is certain to take fire. A Blue-book recently issued on the Causes of the Explosion in the Trimdon Grange Colliery, which took place last February, convicts the Davy Lamp as the offender; and its use will now no doubt be prohibited in all fiery mines. An accident at the West Stanley Colliery two months later has also been traced to the faulty nature of the lamps in use, although in this case the Davy Lamp was not employed. In short, a really safe mining-lamp seems just now to be a thing wanted. Whether electricity will answer all the requirements of a miner's work, we are hardly prepared to say; but it is very certain that a long time must elapse before the electric light, even if it be suited to the purpose, can be installed at all our collieries. The lamp required must give a good light, must be portable, and more than all, to meet with universal attention, it must be cheap and simple.

A very useful Act of Parliament has just come into force. Its object is 'to make better provision for inquiries with regard to boiler explosions.' That such a measure was really needed may be judged from a consideration of the many disasters which occur annually from boiler explosions—eight hundred and sixty-five explosions are recorded for the past seven years—killing and wounding more than double that number of persons. One-third of these fatalities are attributed to negligence or mismanagement; and we may feel certain that quite as large a proportion may be set down to corrosion and other forms of dilapidation which were allowed to go on unremedied in the boiler. The new Act is most stringent in its provisions, and we trust that it will have a salutary effect upon those owners of steam-power who are not too careful of the lives of their workmen.

A British patent has been secured by Messrs

Brin of Paris for the production of red and white wine from beetroot, and the product is said to resemble and to possess all the qualities of the juice of the grape. The root is cooked and pressed, and the juice is fermented in reservoirs furnished with steam-coils, so that the process can be regulated; after which water, tannin, and lastly alcohol to bring the mixture to any desired strength, are added. For white wine, the white beetroot is employed, the operations being exactly similar to those adopted in making the red wine. The colour of the latter is so brilliant, and it contains so much saccharine matter, that it is valuable for enriching grape wines which are deficient in those respects. Whether the new product is to become a help to the adulterator, or a new beverage, remains to be seen.

The railway returns for 1882 show that there are now eighteen thousand one hundred and eighty miles of railway open in the United Kingdom, involving a total paid-up capital of seven hundred and forty-five millions five hundred and nineteen thousand pounds—a sum within a few thousand pounds of being as great as the amount of the National Debt itself! This affords a striking illustration of the enormous wealth of this country—of the amazing extent of its financial resources.

This year's meeting of the Social Science Congress at Nottingham forms the twenty-fifth anniversary of its formation as a society. It was founded on July 29, 1857, at a private meeting held at the residence in Grafton Street, London, of the late Lord Brougham, who presided on the occasion. By way of signalling its successful career hitherto, the Secretary of the Association has issued a little Manual, giving a narrative of past labours and results, which will be found useful and interesting to those who watch the progress of Social Science. It is published at the office of the Association, 1 Adam Street, Adelphi, London, W.C.

In papers recently read before the Royal Society of Edinburgh, as well as the Society of Telegraph Engineers and Electricians, on Tests of Incandescent Electric Lamps, &c., Principal Jamieson, of the College of Science and Arts, Glasgow, has given us a valuable contribution to the subject of electric lighting. Mr Jamieson extended the tests he had previously taken at Queen Street Station and in Sir William Thomson's laboratory, and by the aid of the electrical-engineering students studying at the College of Science and Arts, he produced a number of large diagrams and curves, giving the relative candle-powers and efficiency of Swan, Edison, Maxim, and Lane-Fox lamps, from which we take the following examples, but would refer those more particularly interested to volume eleven, number forty-two, of *The Journal of the Society of Telegraph Engineers and Electricians*. Swan lamps when giving an average light of 21·6 candles, had a mean resistance of thirty-two ohms, and for every horse-power of electrical energy expended on them, produced light equal to two hundred and twenty-five standard sperm candles; or in round numbers, ten lamps, giving twenty-two candles each, can be produced from one horse-power. Edison eight-candle lamps had a resistance of sixty-one ohms when incandescent; and for every horse-power, one hundred

and thirty-eight candles were obtained, or seventeen lamps of eight candles each. As pointed out, these and the other numerous examples given by him do not include the energy that would be lost in driving the engine and dynamo, but simply the equivalent in horse-power of electrical energy expended directly on the lamps.—From a perusal which we have made of the syllabus of the Glasgow College of Science and Arts (38 Bath Street), we observe that every advantage in the way of lectures and laboratory-work is being offered to young men desirous of becoming electrical engineers and electricians.

The *Times* newspaper, in discussing the relative destructiveness of common shell and shrapnel, states that the idea that the superiority of the latter is established for all cases and under all conditions, is not quite correct. 'Exhaustive trials,' it says, 'have been made in England and in other countries, with the result that, in order to insure perfect efficiency, field-artillery should carry both of these two projectiles. The common shell is made in different forms, but the principle of its action is always the same. It contains as much powder as can be placed within its iron or steel envelope, and is intended to act by explosion, breaking down defences, setting fire to houses, and generally smashing everything which it comes across, in addition to killing a limited number of men. Common shell, also, used with a percussion fuse, so as to burst only on striking an obstacle, is very effective on firm ground, and is also extremely demoralising. The intention and effect of shrapnel are entirely different. The shrapnel shell consists of the thinnest envelope which can be found without breaking up, and this is filled almost entirely with hardened bullets. A very small charge of powder, only just enough to open the envelope, serves to liberate the bullets at the moment intended, and they then scatter like shot from a fowling-piece. Thus it will be seen that if a good many guns are firing shrapnel at the same time, and the fuses are timed so as to burst a few feet above the ground, the whole of the troops attacked are covered with a shower of bullets. Shrapnel shells have been called the man-killing projectile. Their effect against troops in the open is very great, and would be greater but for the difficulty of timing the fuse so that the projectile should burst exactly at the right moment and in the right place. Another function has lately been assigned to common shell. Incendiary stars are carried with each battery, and can be placed, when required, within the common shell. When the shell bursts, whether in the air or on the mark which it hits, the stars are scattered, and create great light and heat.'

OCCASIONAL NOTES.

COMBUSTION WITHOUT FLAME.

ABOUT a year ago, a new organisation was formed in England, called the Society of Chemical Industry, and at one of the recent meetings of the members, an interesting experiment, involving a new theory of combustion, was submitted by Mr Thomas Fletcher of Warrington, whose many ingenious inventions and discoveries we have

before had occasion to notice. The belief has often been stated that if it were possible to produce combustion *without flame*, the temperature attained by the consumption of any fuel could be enormously increased; and it seems that Mr Fletcher has now proved that this is possible. Directing an ordinary blowpipe gas-flame upon a ball of iron wire weighing some three pounds, Mr Fletcher after a few moments blew the flame out, leaving the gas on, however, as before. The temperature immediately rose, and was steadily maintained until the iron was fused like wax. The room was darkened, but the closest examination did not show a trace of flame, although the fact that the gas was operating was proved by repeatedly relighting and extinguishing it. This flameless heat was then directed into a fireclay chamber containing a 'refractory' clay crucible, which was 'partially fused and worked into a ball like soft putty,' while the walls of fireclay were at the same time fused by what is called latent heat. The gas supply used was given by a quarter-inch pipe; and from Mr Fletcher's experiments it appears that the presence of flame is not really a sign of perfect but of imperfect combustion. It is not improbable that this demonstration of the possibility of absolutely flameless combustion may lead to important changes in the present modes of heating, many of which involve great consumption of material.

USEFUL REFORM IN POLICE INSTRUCTION.

A most useful and much desiderated branch of police education has just been introduced into the Metropolitan Force. This consists in giving the police officers a kind of surgical training sufficient to enable them to deal readily with many of the ordinary accidents to which people are liable. The society under which this training is carried out is called the St John Ambulance Association. Certificates of efficiency were a few weeks ago presented to seventy-nine London policemen; and Dr Sieveking, Physician Extraordinary to the Queen, addressing the force on that occasion, spoke of the sympathy felt by the medical profession with the objects of the Association, and of the special value to the police of the instruction imparted. He advised them to keep up their knowledge, and encouraged them to do so by referring to a case which had come under his notice, where valuable assistance was rendered to an injured lady by a policeman. Colonel Duncan, Director of the Association, also spoke, and, referring to the case of an officer who was shot in the femoral artery, and of a man who was that day reported to have bled to death in consequence of a wound from a scythe, said that any one of the men who were receiving certificates that day would probably have been able to save those lives if he had been near at the time. The objects of this Association seem to us to recommend themselves very strongly to police authorities all over the country.

THE POPULATION OF THE EARTH.

As an authority concerning the population of the different countries of the world, the publication called *Die Bevölkerung der Erde*, published by Justus Perthes of Gotha, occupies a high position. From the seventh issue of this work, which

has recently appeared, we find the total population of the globe estimated at 1,433,887,500, an apparent decrease in the estimate of 1880 of about twenty-two millions; while the recent censuses of all the great countries show an increase of over thirty millions. This is, however, partly explained by a readjustment of the population of China, which, formerly given at 434,626,500, has now been carefully revised, and estimated at 371,200,000. After this change of figures for China, Asia is set down as possessing a population of 795,591,000; this includes the two hundred and fifty-two millions for British India, and the fourteen and a half millions of the territory of Russia in Asia. The results of recent censuses in Europe show an increase in the population, which is now stated at 327,743,400, as compared with 315,929,000 in 1880—an increase of about twelve millions. Africa is set down as having a population of 205,823,260; America, 100,415,400; and Australia and Polynesia, 4,232,000. Before some of these vast numbers, the total population of the United Kingdom at last census (thirty-five millions) does not bulk largely; but this is more than counterbalanced by the vast power and influence wielded by our country in every portion of the habitable globe.

PRITHEE MADAM.

PRITHEE madam, what are you,
That you accept with scorn
Love that is honourable, true,
And constant, night and morning,
Exacting it as beauty's due?

Beauty lures, but love must bind,
And beauty's long unkindness,
Although that love were ten times blind,
Cures him of his blindness,
Gives him back his lucid mind.

Though love, it seems, less pleases you
Than admiration endless,
You'll find in such a retinue
Much that is cold and friendless,
Flatterers many, lovers few.

With these I neither sigh nor weep,
I only give you warning,
That for the future you must keep
For some one else your scorn;—
I'm sick of it. Good-morning!

J. B. SELKIRK.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. To insure return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. MANUSCRIPTS should bear the author's full *Christian* name, surname, and address, legibly written; and should be written on white (not blue) paper, and on one side of the leaf only.
- 4th. Poetical offerings should invariably be accompanied by a stamped and directed envelope.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

THE NATIONAL LEDGER.

THERE is no more fascinating volume to a successful merchant than his ledger, a book which contains the record of his energy and perseverance, and on whose pages are summed up the numerous items which form the foundation of the golden superstructure he has raised. John Bull's Ledger, in the shape of a modest tenpenny blue-book entitled 'The Finance Accounts of the United Kingdom,' has recently been issued from the offices of Messrs Eyre and Spottiswoode, the Queen's printers, and in its pages of closely tabulated figures there is a story of successful business which should make it very acceptable reading to the British taxpayer. Few persons, however, care to wade through a mass of figures and tabulated statements, and we shall therefore refrain from going into the vast details of the debtor and creditor account of the immense total of nearly one hundred millions of money which represents the income and expenditure of that portion of the British Empire over which the Chancellor of the Exchequer has power for good and evil. We shall state a few of the larger facts with reference to this vast sum, and then lay before our readers some of the remarkable items which go to build up on one side or the other the colossal account of the 'business' recorded in the National Ledger.

In spite of the Chancellor's sweeping fiscal reforms, it appears that the Custom-houses of the United Kingdom still collect the handsome sum of nineteen millions a year, and the Excise not less than twenty-seven millions. The Post-office shows a gross revenue of seven millions, notwithstanding the alterations which are being continually carried out, and the fact that several millions have been sunk as capital for the provision of better rates of pay to the telegraphists and letter-carriers.

The Income Tax was bringing in no less a sum than ten millions before the recent increase on account of the Egyptian Expedition; while the sale of stamps realised the sum of twelve

millions. The other side of the account shows how nearly all these millions go to pay for the Army, Navy, and Civil Service; but in the hands of a skilful Chancellor of the Exchequer the national expenditure is rarely, if ever, permitted to exceed the national income. The grand total for the Army and Navy is twenty-six millions three hundred and seventy thousand pounds; that for the Civil Service, fifteen millions; interest of National Debt, twenty-eight millions two hundred and ninety thousand pounds; the Afghan War instalment, five hundred thousand pounds; the Transvaal expenses, four hundred thousand; and the Zulu War, one hundred and thirty-five thousand pounds. There is also a payment of ten thousand pounds for 'Secret Service.'

Having thus briefly described the colossal part of the debt and credit sides of this wonderful account, we will now proceed to 'take stock' of some of the items which go to make up the grand total, and the somewhat singular and interesting nature of which may not, perhaps, be generally known.

Readers of the daily papers must have often noticed that ever and anon there appears in them a paragraph, inserted in some corner of the journals, to the effect that 'the Chancellor of the Exchequer begs to acknowledge the receipt of two halves of a five-pound note from A. B. on account of Income Tax.' This is termed Conscience-money, and amounted last year to no less a sum than five thousand three hundred and forty-six pounds. The Suez Canal shares brought in at five per cent., two hundred thousand pounds; while the Colonies contributed the sum of two hundred and fifteen thousand pounds towards our national defences.

Few people are aware of the fact that in return for permission to issue a paper currency, the Bank of England pays into the Exchequer an annual sum of one hundred and thirty-eight thousand five hundred and seventy-eight pounds. The coinage of silver at the Mint last year brought in a profit of one hundred and sixty-seven thousand pounds, and the bronze coinage nearly

thirty-one thousand pounds. Sovereigns are, it appears, coined gratuitously; while no less a sum than four hundred and eighty-four pounds in old copper coin was melted down for alloy. Even the sweepings of the Mint floors brought into the Exchequer the sum of six hundred and thirty-four pounds five shillings and elevenpence.

We are somewhat surprised to find an item of eleven hundred pounds accruing to the Crown on account of some guano islands of which the nation appears to be the proprietor; while 'small branches of the hereditary revenue'—whatever these may mean—are credited with the sum of twenty-eight thousand pounds per annum.

As all 'wrecks and derelicts' upon the coasts of the United Kingdom are claimed by the Crown, the national income from this source is augmented by the sum of one hundred and sixty-nine pounds eleven and ninepence. This small sum is in itself a practical testimonial to the excellence of the work carried on by the National Lifeboat Institution. Beside this, the rights and interests of the Crown in the foreshores of the kingdom brought in last year two hundred and seventy-six pounds seventeen shillings and ninepence.

Passports are evidently far from being as obsolete as some persons think, for no less than four thousand were issued by the Foreign Office during the year, the fees on which amounted to four hundred and nine pounds. Our consuls abroad paid into the national Exchequer through the Foreign Office nearly fifty-two thousand pounds on account of fees received by them in the exercise of their consular duties.

One interesting item in this long account is that of the Tower of London, which is credited with the sum of two thousand two hundred and seventy-six pounds on account of the fees paid by visitors to view the Crown jewels and armouries, &c. Another item stands for 'Fees of Honour' in the Queen's Household, by which is probably meant the fines inflicted on its members for disregarding certain rules of etiquette or propriety. The sum credited to this source was last year fifty-five pounds eleven shillings and sixpence. Another item in connection with the Royal Household is the 'Contributions for Keys,' which consists of small payments made by privileged individuals for admittance into the royal precincts of the various palace-grounds and demesnes. This and various other items, such as 'Grazing and other rents, venison fees, receipts for old materials [rags and bones?], timber, and live-stock,' together produce the respectable sum of five thousand and forty pounds.

The wages and effects of deceased seamen revert to the Crown if not claimed within six years; and it may be imagined that the sum invested on this account must be very large, seeing that the interest alone brought in eleven hundred pounds last year.

We will close our list of items on the debit side of the National Ledger with those standing under the head of 'Convict Labour.' The Exchequer received during the past year a sum of two thousand three hundred pounds on account of profits on farms cultivated by convicts, and the large sum of sixteen thousand pounds for profits on convict manufactures, exclusive of another sum of eight thousand eight hundred pounds for 'profits on prisoners' labour.'

On turning to the Credit side of the Ledger, we find ourselves floundering among a mighty host of state pensioners, some of a perpetual nature and others but temporary. As a handsome item of compensation for the 'abolition of office,' we may *en passant* quote the case of the Receiver of the Duchy of Cornwall and his deputy, who receive for 'loss of office on the abolition of the duties on the coinage of tin,' &c., an annual allowance of seventeen thousand pounds!

The Royal Family of course head the list of annuitants, commencing with the Crown Princess of Germany (Princess Royal), eight thousand pounds, and ending with the Princess Mary (Duchess of Teck), who receives two thousand. The whole amount under this head, not including of course the amounts granted this year on the marriage of the Duke of Albany, is one hundred and sixty-one thousand pounds.

Next in order come the Civil List pensions, which amount in the aggregate to the sum of twenty-two thousand five hundred and eighty-nine pounds. The names of the recipients of these pensions are not given, probably on account of the number, as there must be quite an army of them, seeing that not more than twelve hundred pounds per annum is granted to the Crown by parliament for this purpose. Thirty-eight thousand one hundred and sixty-six pounds per annum is absorbed by the pensions for distinguished military services. At the head of this list stands the famous Duke of Marlborough, to whom and to whose descendants 'for ever' parliament granted the yearly sum of four thousand pounds, beside a splendid palace to live in and estates around it. Lord Napier of Magdala closes the list with a pension of two thousand pounds, which is to last for two lives only.

Twenty thousand four hundred and thirty-four pounds per annum is the amount absorbed by Political and Civil Service pensioners, amongst whom for the last time will figure the late Lord Beaconsfield, Sir George Grey, Mr Milner Gibson, and Mr Spencer Walpole. In this list, the man who gets the most handsome allowance is Lord Clarence Paget, who receives a pension of twelve hundred pounds per annum as an ex-First Secretary of the Admiralty, in addition to his retired pay of two guineas a day as a vice-admiral. The veteran Corn-law abolitionist, Mr C. P. Villiers, also draws a pension of twelve hundred a year as an ex-Cabinet minister.

Forty-one thousand pounds is the amount of the pensions awarded for judicial services to the state, the names of three Lord Chancellors, at five thousand a year each—namely, Lords Cairns, Hatherley, and Selborne, being on last year's list. Lord Hatherley has since died; and Lord Selborne, being Mr Gladstone's present Lord Chancellor, of course receives a salary of ten thousand

pounds, the pension being suspended in the meantime. This does not include Ireland, which has a Judicial pension list of over twenty-two thousand pounds.

It is rather amusing to see with what arithmetical precision the pension is stopped by the Treasury on the day of decease; not a fraction more than was absolutely due to the departed pensioner being paid to his heirs or administrators.

The hereditary pensions to the heirs of the Duke of Schomberg, which Thackeray ridiculed in his ballad of the *Battle of Limerick*, and amounting to nine hundred and eighty-four pounds, still appear in that portion of the list which may be termed a collection of 'curiosities.' The heirs and representatives of the founder of the Quaker City, Mr Penn, still receive the pension of four thousand pounds per annum granted them by parliament 'for ever.' The Earl of Kinnoull receives a pension of one thousand six hundred and twenty pounds four shillings, on account of certain 'four-and-a-half-per-cent. duties,' in addition to an hereditary pension granted to one of his ancestors by King Charles II.

Many persons are still living and enjoying pensions granted them in the reigns of George III., George IV., and William IV.; whilst there is also a payment of thirty-two pounds six shillings and fourpence to 'persons who suffered by the Irish Rebellion of 1798.' Altogether, the gross amount for pensions and annuities is over three hundred thousand pounds, which is, after all, but a small amount compared with that wonderful income of nearly a hundred millions sterling, which is shown on the debit side of the National Ledger as the result of the untiring industry and splendid perseverance of the inhabitants of the British Isles.

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

BY DAVID CHRISTIE MURRAY.

CHAPTER XXXIX.—'ALL IS READY,' SAID VAL QUIETLY. 'TELL YOUR MISTRESS.'

It was the last night in June, and a score of jovial young gentlemen were making merry at Lumby Hall. There were two elders with them—Mr Lumby and Mr Jolly, and but one of the invited guests was absent. The ladies staying at the Hall to attend the morrow's ceremony were a little aggrieved by the bachelor party, and the drawing-room was dull. The general feminine opinion was unfavourable to Mr Lumby's projection; but the old gentleman himself was in high-feather amongst the young fellows gathered about his son, and knew nothing of the muffled petticoat rebellion. He was growing stronger every day, and had already, without much mental difficulty, gone through terms of settlement with the lawyer, making over half his share in the City House to Gerard. He sat there and sipped a glass of wine, and chatted gaily, if somewhat childishly, for a time, and then withdrew, leaving the bride's father to keep the younger blood in order, if it should need a restraining hand. The elder Jolly was glorious, and had assumed so juvenile an air, that beside the bald-headed Reginald he looked young,

and the two might almost have changed relationships.

'Where on earth is Val Strange?' cried Gerard. 'Don't any of you men know?'

'There's been something odd about Val lately,' said one of the guests; 'I began to think yesterday that he had a tile loose.'

Reginald thought that possibly he might be able to throw a little light on the reason of Val's absence. If you love a woman yourself, it is not altogether easy at the last moment of losing her to congratulate the man who carries her away from you; and the difficulty seemed likely to be increased when the congratulations were expected to extend over the time occupied by a dinner and an evening meeting like the present. So that, knowing what he did, it would have been easy to explain Val's late eccentric conduct—if it had not been impossible to offer such an explanation.

At this sort of gathering there are generally one or two people who are eager to make speeches. The elder Jolly was absolutely overflowing with Disraelian eloquence, but he had to save himself for the effort of the morrow. He had written his speech, and had committed it to memory; and it was his belief that this oratorical effort, when it came to be produced would sparkle like fireworks. The audience would include a good many of the county magnates, and he felt that they would be almost worthy to listen to his carefully-prepared impromptus. A bashfully-eager gentleman in a corner was being urged by his companions to rise; and had at length, in spite of himself, given so decided a negative, that the attempt to persuade him had been almost abandoned, when Mr Jolly, discerning that beyond a doubt the tide of speechmaking, if it once set in, would drift his way, burned so eagerly for a chance, that he beat a tumbler upon the table and cried: 'Gentlemen, Mr Whetham is longing to address us.' The Cicero of the corner coterie being thus publicly signalled-out for attention arose, smiled vacuously, played in a *déagé* fashion with his watch-chain, and with a curious springy motion in the legs, unburdened his soul in manner following: 'Gentlemen all. And Mr Jolly. Had extreme happiness—knowing—friend—Lumby—years. No hesitation—saying—admirable fellow—calculated—perform—duties—citizen—most satisfactory manner. Call upon you—therefore—drink his health—musical honours. Really sorry—can't express—feelings—overwhelming at the moment—more flowing language. Gentlemen, Mr Gerard Lumby.' Then he sat down, and wondered where his speech had gone to, and whilst he wondered, the toast was hailed with enthusiasm, and the young gentlemen assembled sang, *For he's a jolly good Fellow*, with such heartiness that the startled domestics rose in the servants' hall, and the ladies in the drawing-room looked at each other in amazement. Lady Farham, relict of Sir Samuel, late of Mincing Lane, and mother-in-law to George Lumby, murmured to her married daughter that it was really like a tavern, and fell into a stony contemplation of the wall-paper, from which she was aroused with difficulty. She said afterwards, in view of the events of the night, that she had quite expected a judgment.

Gerard returned thanks with hearty brevity,

and then somebody proposed the health of the bride. He was a very young gentleman, with a habit of saying in the duller portions of his oration—'In short, gentlemen, as the poet says'—and at these moments the guests looked towards him with a look as of awakening interest. But as he always forgot what the poet said and toiled off into prose, they settled back again in a manner disconcerting to the speaker's feelings. Finally, when the young gentleman had made half-a-dozen abortive efforts to recall the poet's utterances, he sat down; and the guests cheered for the bride, and drank her health with much ardour; and Mr Jolly arose. It was one of those supreme moments of temptation which occur not more than once in a lifetime, and he yielded. He spoke the speech he had prepared for the wedding breakfast; and having delivered himself, sat down and contemplated the draft which would be made upon him in twelve hours' time, and he a mental bankrupt. After such an effort as he had already made, he knew that great things would be expected of him. He had fired his *feu de joie* a day too soon, and the consciousness that he had no powder left, was indescribably depressing. He felt that the reputation he had already created would be fatal to him. But suddenly a ray of light illumined his mind, and he became tranquil and even happy. He resolved that he would be too much affected to say anything!

'When the cat's away the mice will play,' said Hiram Search to himself as he stepped forth from the gates of Lumby Hall into the softly-clouded summer night. 'They'll prob'ly be rather lively over at the Grange this evening, an' I'll just walk over an' have a look at Mary.' He lit a pipe, and walked comfortably, thinking of the morrow's wedding and the improvement it brought in his own chances. He would not be single much longer, though he was less in a hurry to marry than he had been. Not because his affections had in the least degree cooled, but because Mary was now provided for, and the old reason for desiring at once to assume a position in which he could protect her had been removed. As members of one household, they would be together, and Hiram looked forward to a period of courtship which bade fair to be extremely pleasant. He had got over half his walk, when the moon shone out suddenly with so charming a lustre that he paused to observe it. As the cloud which had hitherto obscured the fullness of her splendour slowly sailed away, moved by some wind too high for him to feel its faintest breath, the broad silver light seemed bit by bit to drive back the shadow over the fields towards the sea. The moonbeams with that wall of retreating darkness beyond them made the distance dimmer than it had been, and almost shut the water from sight. But suddenly they touched and silvered the foam of the little breakers on the sand of the bay, and passed along as if floating out to sea, and in the midst of the belt of light he discerned the snowy sail of a vessel as it rounded Daffin Head. 'I guess that's Mr Strange's yacht,' said Hiram to himself. The little craft had been creeping a good deal about the coast for the past week or two; and Hiram, like the rest of the inhabitants of those parts, had become familiar with her aspect.

In the mind of a fanciful man, thousands of odd little premonitions which never come to anything, rise and float about and go again, to be forgotten. But if ever by chance one of these idle fancies is fulfilled, it becomes memorable, and erects itself into a precedent. Perhaps to Hiram's mind there was an unrecognised sense of something furtive suddenly revealed in the little craft stealing round the headland in the mist of night and being thus made visible. He had taken a dislike to Val Strange, and he had been exercised by the discovery of the photograph. There had been a latent feeling of resentment in his mind that evening at Val's absence from his friend's dinner-party, and Hiram had been inclined to think that Mr Strange was 'hankering'—that was his phrase—'after the boss's little gell.' Being thus predisposed to think ill of Mr Strange, and having some ground for suspicion already, he absolutely surmised that the *Mew's-wing* might be hanging about to carry off Constance. He smiled at the thought, and pooh-poohed it, and put it away, as being altogether too preposterous to be believed in. And yet it had a sort of hold upon him, and made him feel unhappy and discontented with himself.

'If there *should* be anythin' in it,' he said at last, 'what a dog I should feel if I'd neglected this curious kind o' warnin'. Does *seem* kind of like a warnin', somehow. Such things hev been, I know. Why, Hiram, s'pose you make a fool of yourself, and look into this matter. 'Twon't be the first time you've gone a fool's arrand, and nobody need know what an ass you are. You ain't afraid o' me laughing at you, air you, Hiram?' He walked on swiftly; and bodily motion adding, as it often does, to mental excitement, he grew out of the cheerfully cynical mood in which he had started, and came to something like genuine fear and earnestness. When he saw the lights of the Grange, he chose the turfy side of the lane rather than the resounding road, and ran crouching along as if he were hunting something. Near the gates he paused, and a voice struck upon his ear. His heart began to beat, and he clenched his teeth and his hands and listened. The excitement he was in was more than nine-tenths self-created, and he knew it, and rather scorned himself for it. Strain his ears as he would, he could hear no more than the murmur of the voice, and could not make out a spoken word, until, to his complete surprise, he heard his own name, singularly coupled. Two words came clearly—'Marry Hiram'—and then the voice went humming on again inaudibly. 'Marry Hiram?' thought the listener. 'Am I dreamin'? What on airth is this?' He crept nearer, and heard the voice more clearly.

'You must know,' it said in low and urgent tones, 'that unless she has a female companion, she will be laid open to such scandalous suspicions that there will be no removing them. You will have no responsibility. It is not in your power to prevent her from going. I will land you at Swansea to-morrow; and directly after the wedding, you can return; and with five hundred pounds in hand, you can marry at once. Think, you foolish girl, how few the chances you are likely to have of making so much money.'

Hiram needed no sight of the speaker to know that it was Val Strange. He seemed in

a very whirlpool of amazement, and could scarcely believe that his premonition was coming true, clearly as he heard the words and plainly as they carried their own meaning.

'Oh,' said another voice, and though Hiram was prepared to hear it, he started at it, so that he almost betrayed his presence, 'Hiram would never forgive me—never! He is fond of Mr Lumby, and he spoke of him many a time before he went into his service. And, O Mr Strange, you have been very kind to me'—(What was this? asked the listener, with a new madness in his veins)—'but is it fair to run away with her the day before the wedding?'

'Will you come?' asked Val impatiently. 'Yes, or no. Five hundred pounds—think what it means—wealthy friends for life, who will never forget the service you have done them—think what it means. Will you come?'

'O Mr Strange,' cried Mary, 'I dare not. It all seems wicked, and Hiram would never forgive me.'

'You are not so grateful as you pretended to be,' said Val, under his breath, but with anger in his tones. 'You might never have seen Hiram again but for me. What would you have done if I had not befriended you at Southampton?'

The listener in the midst of his amazement breathed more freely. He had heard that story. So Val Strange was the unknown benefactor upon whom he had so often called down blessings in his heart. It softened somewhat the rage he felt against him.

'If it were not for Hiram,' cried the girl.

'Hush!' said Val. 'Do not speak so loud. Come, decide. Your mistress will not move without you; and if you will not come, you have wrecked her life for ever. Ask what you will. If you are trying to make the terms for such a trifling service higher, ask what you will. Think what this foolish delay may mean. Will you come?'

'No,' said the girl, but in a voice in which the listener could read a tone of yielding. He crept nearer, until he laid a hand upon the gray stone of the gateway pillar. The gates were open, and the pair stood just within them. Val pressed the yielding girl harder.

'Suppose somebody tried to make you marry a man you did not love, and Hiram wanted to save you and to take you away, would that be wicked? And if you had a friend who was too hard-hearted to come with you and save you from scandal, would you forgive her?'

'I will go,' said little Mary.

'No,' said Hiram, stepping into the moonlight; 'I reckon you won't.'

They stood astounded before him. Mary shrieked, and ran towards the house; but Val was rooted to the spot he stood on. For one awful moment he expected Gerard's form to appear behind Hiram's, and almost listened for the reproaches of the friend he had endeavoured to betray. But he was no coward after all, and his nerves sprang up like steel as he faced the intruder.

'What brings you here?' he asked.

'I can't speak lightly of sacred things, Mr Valentine Strange,' said Hiram; 'and I won't say what hand guided me here to stop you

villainy. But I'm here in time. Drop it. I shan't break my master's faithful heart by telling him the plot I lighted on. But I score off you. I do now, re'ly.'

'Do you?' said Val with desperate softness, toying with something that hung at his watch-chain and glittered in the moonlight. 'Are you sure?'

'I'm sure of this much, anyway,' said Hiram, drawing on the words—'I shan't clear out of this 'fore you do, an' it'll bother you to take my boss's gell away while I stand by.' Val raised the glittering something to his lips and blew a soft clear whistle. Quick as lightning, Hiram leaped at him, and though too late to check the call, he gripped his wrists like iron, and began to haul him down the carriage-way, resolved on holding him and alarming the household. They could not all be in the plot, and some of the men-servants would surely be ready to do a little for the honour of the house they served.

'Come here and help me,' said Val in a soft and quiet voice. 'Hold this fellow, and do not let him go, till we are safe on board.' Before the words had left his lips, Hiram released his hands and struck him down. Turning, he saw three seamen in the gateway, and grasped the whole situation in a flash. It would take the yacht an hour to round the headland, and he felt sure that he could reach Lumby Hall in a quarter of an hour. That would give time to alarm Gerard, to saddle horses, and to gallop here and intercept the flight, or even to pull out and board the yacht. He stood a second, and then burst past them at a leap, and recovering from a stumble in the road which had almost wrecked his purpose, he sped down the lane like an arrow.

Val was on his feet again. 'Follow him!' he cried. 'Double across the fields, and stop him at any cost. He is making for Lumby Hall,' he panted, running beside his men, already in pursuit. 'This way, and you will cut him off before he reaches Welbeck Bay.'

But as they broke through the hedge, they saw that Hiram, nearly a hundred yards ahead, had shot through a gap, and was taking advantage of the short-cut home. He ran like a hare, and at every stride increased the distance between himself and his pursuers. Val called them off, and they came back breathing heavily, from the brief burst they had made.

'You have the luggage?' he asked.—One of them answered 'Yes.'—'Run down with it to the boat at once. Two of you can carry it.—You, Thomson, stay behind with me, and take care of the maid.' It was evident that he had taken the crew of the yacht into his confidence, and probable that he had even feared some failure in his plans. The two men set briskly off; and Val, leaving the third at a little distance from the gateway, walked down the drive, stopping a moment to adjust his disordered dress. The back of the house was in complete darkness as he passed it, but there was a sound of laughter in the servants' quarters. He went by lightly, and entered at the open windows of the dining-room. There he found Mary. She was crying bitterly, but with little noise.

'All is ready,' said Val quietly. 'Tell your mistress.'

'I dare not go,' sobbed the girl.
'Your master will be here in half an hour,' he answered; 'and he will know that you were in the plot. You must go—you dare not stay.' The girl wrung her hands, and stood irresolute.—'Go!' he said sternly; and she obeyed him. A minute later, Constance glided into the room with the maid behind her. Her hand, as she laid it on Val's arm, trembled as a steel spring vibrates when shaken; but without a word on either side they stepped on to the lawn, and Mary followed, travelling the Primrose Way like her betters, and like them, finding it unpleasant, and less smooth than downright honour's roughest footpath. They glided noiselessly round the house, and noiselessly along the gravelled carriage-drive. There, at the gate the seaman came from the shadows and gave an arm to the weeping maid. Once in the lane, Constance walked with a firm step; but the high-strung tremor of her hand warned Val against addressing her. Ten minutes' walking brought them to the shore, and they could see the boat that awaited them. Constance knew nothing of the alarm; but Val in his mind's eye saw the long figure flying over the fields in the moonlight, and in his strained and exalted fancy could almost hear the beat of his hurried footsteps. He watched Hiram in fancy breasting the rise which led to Lumby Hall, and he saw the old friend he had so wronged, sitting happy and exulting in the thought of to-morrow's happiness, and knowing nothing of the blow the panting messenger came in haste to deal. Val had won his stake, and nothing could come between him and Constance now; but he was so far from happy, that he could well-nigh have surrendered his triumph. Yet for her sake, if not his own, there could be no surrender, and he must be tender to her and true to her. For many a day to come, he would have to fill the place of all the world to her, and he vowed that he would do it. If the heart-service and perpetual worship of the man she loved could make her happy, her life should go without a cloud. But even as these vows rose in his heart, he seemed to see and hear the hurried flight that carried the awful news.

'Give me your hand, my love,' he said gently, and helped Constance into the boat, and leading her to a seat, wrapped a cloak about her tenderly. The maid followed with her attendant seaman. 'Give way, men!' he said gravely and quietly. The bow of the boat lay upon the beach; but two of the men pushed her off, and leaped in as she floated. Val took the tiller ropes, and steered to where in the distance the yacht's white sails gleamed. His thoughts were still with the flying messenger, and followed him until the fatal message was delivered. 'He knows by this time,' he thought. It was not easy for Val Strange to be a sinner against friendship and honour. An almost unbearable pang ran through his heart as he pictured Gerard listening to the news.

Hiram's listening ear told him that pursuit had ceased; but he only laid himself out the harder, and ran until his chest seemed filled with fire, and every breath he drew was a sob. As he ran, he planned. So light a wind was blowing, that the yacht could make but little headway, and a well-manned boat might even

take her up. At Lumby Hall they were as near to her as they were at the Grange, unless she had gone more rapidly than he counted. Hiram's hat had gone already in the leap through the gap, and now finding that the coat he wore pulled him down, he slipped from it; but in all his anxiety and haste, he marked the place in which he dropped it, and resolved to return for it on the morrow. The incongruity of such a care at such a moment struck him with ridiculous force, and he had to fight down a half-hysterical desire to laugh. A two miles' run is a heavy business for a man who is out of training, and Hiram, before he reached the gates, had run himself almost to a stand-still, and his most urgent efforts took him scarcely faster than his average walk. But he toiled on, and coming near the house, made a final spurt, and dashed in at the doorway headlong. The venerable butler was the first to meet him, and seeing him running along the corridor in a half-stagger, stopped him.

'Mr Search!' cried the butler in amazement, 'what is it? Thieves?'

'No,' gasped Hiram—'Mr Gerard—fetch Mr Gerard. Call him out here. Quick, quick, quick!'

The butler, with one glance of astonishment, ran to the room in which the party sat assembled. Mr Jolly had just arrived at that happy conclusion already recorded, when the old servant entered and with a flustered air whispered to his young master. 'There's something wrong, sir. Will you come out, please?'

Gerard arose and followed him, and came on Hiram, leaning against the wall, sobbing for breath. The butler paused there, and the young man stopped also, with a look of wonder at Hiram's wild face and figure.

'Call up all your pluck,' said Hiram; 'you'll want it. Valentine Strange has bolted with'—

'What?' roared Gerard, and taking Hiram by the shoulders, he shook him like a reed.

'Miss Jolly,' gasped Hiram, and fell back against the wall, panting and glaring.

The young man's wild cry brought an inquiring face to the open door of the room he had just quitted.

'You lying villain!' said Gerard hoarsely, glaring back at Hiram.

'Gone aboard the yacht,' said Hiram, struggling so to speak that it was terrible to look at him. 'Don't waste a minute. Go to the boats. You may catch them yet.'

The corridor was filled. 'What is it?' asked one, laying a hand on Gerard's shoulder. 'Nothing wrong?'

Gerard shook him off and burst into awful laughter. 'This dog,' he said, turning an ashen face on Hiram, 'has a reputation as a humorist. He has been drinking, and has brought a jest home with him.'

'Don't waste a minute,' gasped Hiram again, struggling upright and seizing Gerard by the arm.

'If I thought your tale was true, you drunken rascal,' answered Gerard, 'do you think I would take a step to bring her back again?'

'To bring her back again?' repeated Reginald, pushing his way through the 'crowd.—'Lumby, what is this?'

Gerard pointed him to Hiram, and as he did so, there was a look upon his face which made the messenger's heart ache.

'Valentine Strange has bolted with Miss Jolly. They're aboard the yacht.' He tried to whisper, but his broken breath made each word a sob, and every man standing in the corridor heard the news.

'There's a pretty story, isn't it?' said Gerard, turning on Reginald. His face, beyond all words, was terrible to see.—'Is it true?' he said, laying his heavy hands on the little man's shoulders, and rocking him slightly to and fro—'is it true?' The two men looked at each other. Such a look! There was not a sound heard but that of Hiram's laboured breathing. 'He believes it,' said Gerard. 'The man is her brother, and he believes it.' He threw his hands aloft and burst into laughter so wild and loud, that the frightened women-folk came streaming downstairs, and the servants came up and peered into the corridor. 'Do you believe it?' he cried, turning upon Mr Jolly.

'No, sir,' cried he. 'It's an infamous fabrication, an abominable fabrication.' He was white to the very lips; but it was evident that he did not believe it. 'Reginald,' he cried blusteringly, 'deny this infamous scandal.' As he turned upon his son with this appeal, Gerard turned upon him too.

'Denying it will not help us, sir,' said Reginald.

'Let us get our carriage and go home.'

'What?' cried the father. 'You believe it?'

'We may be of use at home,' said Reginald doggedly. Even Mr Jolly read despair in his face and voice.

'Gentlemen,' said Gerard, in a loud voice, 'let us go back to our wine.'

His mother struggled through the crowd, and the men made room for her. 'Gerard!' she said, touching him. He fell suddenly on his knees before her, and catching at her hands, he burst into such weeping as no man there had ever heard before.

THE ENGLISH UNIVERSITIES EN FÊTE.

THE year 1882 will be remembered in Cambridge as marking the commencement of a new order of things. A very salutary change in the customary procession of events in the May Term has brought it about that this year, for the first time, the two great English universities were simultaneously *en fête*. 'Commem' at Oxford and the 'May week' at Cambridge are as much recognised institutions as 'Greats' and Tripos, as the Vice-chancellor and the Senior Proctor; and he who should suggest the abolition or curtailment of either of the university carnivals, would be regarded as a revolutionary innovator, no less dangerous than if he had proposed to pull down 'Tom Quad,' or to let out as building-plots the university cricket-ground. Whether the coincidence of the two events this year made any perceptible difference in the number of visitors to either town, is a question which would agitate the minds of the undergraduate element but little, provided their own particular contingent of friends did not give the preference to invitations from

the rival seat of learning, and that the lady-visitors generally were up to the average in personal attractions, dancing powers, and capacity for appreciative sight-seeing.

Cambridge, it is true, had the advantage over her rival in being able to offer the attraction of her annual May boat-races, in addition to the more ordinary and less exciting amusements common to both; and though the pleasure is largely dependent on genial sky and favourable breezes, there is something very alluring to strangers in the series of struggles to be witnessed in the Gut, the Plough, and the Long Reach, from the vantage-ground of Grassy Corner or Ditton Meadows. Long lines of eager young gownsmen, each in the bright uniform of his College Club, rush panting up the tow-path, uttering a babel of discordant but exhilarating cries of encouragement to their champions on the water. One by one the graceful craft appear in sight, the oarsmen swinging like a piece of perfect mechanism, the blades flashing in the evening sun, the coxswain anxiously calculating how closely he dare shave the awkward corner looming in the distance, and how soon he shall venture to call upon Stroke for that final spurt, which shall bring the taper bow within bumping distance of the boat which they pursue. Stroke by stroke the interval is lessened; the cries on the bank grow louder and more excited, as the partisans of each urge them on to greater efforts. The pursuers pull themselves together in obedience to their coach's warning voice, as their boat shows a tendency to roll when it meets the wash thrown from the oars of the leading crew. Another twenty yards, and the word is given. The bow of the pursuing craft overlaps the stern of the pursued; a moment more, and with the fresh impetus of a final spurt, 'cox' ventures to edge over to the side of the vanquished; and amid a turmoil of shouts and splashing, up goes the hand of the steersman of the leading boat. The bump is acknowledged, and each crew ceases from its exertions; the vanquished to mourn over their futile efforts, the victors to receive the congratulations of their friends on having carried the college colours one place higher on the river. But 'the cry is still they come.' One after another follow the rest of the boats, some repeating the scene already enacted, others more happy in being able to row easily over the course, unpressed by their antagonists. And so the day's racing draws to a close; and the crowd of spectators return, some by road, others by water, to prepare for the evening entertainments, wherein the rejoicings of the successful are to be celebrated, and the chagrin of the conquered forgotten.

So the week passes in a constant round of festivity. Garden-parties in the college grounds; picnics up the Granta and the Isis; concerts and balls at night; and not least, the glorious music and impressive services of Sunday, in time-

honoured chapels, whose walls exhibit great names of those who in their turn have studied and worshipped in those sacred precincts—such are the attractions which the universities hold out to their summer visitors, and which are little likely to be forgotten by those who have the good fortune to take part in them.

That the change which has this year brought about the coincidence of these gala-days at Oxford and Cambridge, is a wise one, it is impossible to question. In previous years, it has been the general custom at Cambridge, to fix the boat-races, the centre upon which all the other gaieties hinge, for as nearly as might be the last week in May. By this means, the longest possible time for practice and training was secured between the Easter vacation and the date at which the majority of undergraduates, having 'kept their term,' were anxious to escape. But one unpleasant formality remained to be got over between the gay 'May week' and the commencement of the Long Vacation—namely, the college examinations, by the result of which prizes and scholarships are awarded, and the progress made during the past year is tested. Hence, during that short spell of dissipation, the luckless undergraduate whose prospects depended on his securing a scholarship, or whose heart was set on proving that his time and money had not been thrown away, had this Damoclesian sword hanging over his head, warning him to desist from enjoyment, innocent in itself, but probably unsettling in its effects, or else to give up the hope he cherished. To expect that the pleasant temptation thus actually spreading its lures in front of him would fail to overcome his good resolutions, would have been to ask too much from youthful human nature; and there is little room for doubting that many a prize has just been missed, and many a reward of honest hard work has eluded the seeker's grasp, owing to some accidental meeting with a too fascinating partner at a college ball or river-side picnic, whose bright eyes have temporarily at least proved too much for their admirer's good resolutions, and have eliminated Greek roots and Roman antiquities from his mind just at a critical moment in his career.

But now, as we have already noted, times are changed. It has seemed good to the authorities to relegate many of the final university examinations to the summer instead of the winter terms. The claims of the dread Tripos have been recognised, and in deference to the schools, the boat-races and their attendant festivities have been postponed to such a date, that one and all can indulge, so far as their pockets and their inclinations permit, with a clear conscience, and a happy recollection that the ordeals are behind instead of before them; and that that last *valse* or extra glass of champagne will not imperil their prospects and imbitter their reflections for the ensuing twelve months.

To such as these, and to the multitude of admiring visitors who honour their brothers, cousins, or male friends more remote, with their presence during the gay week, there are few pleasanter oases to look back upon in the desert of workaday life. Venerable college buildings and ancient academical pleasure-grounds are never to be seen

to greater advantage than when the cicerone is a light-hearted young gownsman, full of the dignity and importance of quasi-possession of the place, and anxious to impress his party with a sense of the grandeur and beauty of their surroundings. The 'sweet girl graduate,' flourishing as that race appears to be, has not yet so fully taken possession of our universities as to render feminine society and girlish voices every-day adjuncts of college life; and perhaps their very rarity in those monastic precincts goes far to increase the charm which their presence undoubtedly adds to the otherwise sombre surroundings.

But there is one class of visitors for whom a peep at the university at the height of its carnival is by no means an unmixed pleasure. The man who only a few short years ago was himself one, and perhaps a leading one, of the throng of pleasure-seekers, and who is led by the hope of renewing the associations of those old days to revisit his former college, after spending a longer or shorter interval in the actual battle of life, cannot fail to find an element of sadness mingled with the pleasure which attends his return to the familiar scenes. On the one hand, he meets and re-greets a few of those who in his undergraduate days were his every-day companions, his rivals it may be in the contest for college honours, his comrades in joint struggles on the river and the athletic ground, now sobered down into university dignitaries and college 'dons,' but still capable of unbending at the recollections of boyish freaks and harmless escapades, the like of which it is now their duty to frown upon in others. But on the other hand, he will miss and look in vain for many a former intimate, and many a familiar face. Though unconscious of increasing age so long as he is among his fellow-toilers in the busy world, he will suddenly find himself aged and *passé* here, and will realise that between him now, and the careless undergraduate of former years, there is a great gulf fixed, which nothing can bridge over; and he will feel more clearly than ever the increasing cares and anxieties of increasing years.

But perhaps the changes wrought by time will never be borne in upon him so keenly as when, after a quiet twilight chat over the doings of old times with one of those who shared in those early days his day-dreams and his confidences, he turns to leave his friend's rooms, and by force of long familiar habit, enters the doorway, and climbs the dark staircase at the head of which are the rooms which he once called his own. Reaching the 'oak,' he suddenly misses the latchkey from his pocket, and in an instant his mistake dawns upon him. A strange name is painted on the lintel; a stranger is sleeping unconsciously in the little inner closet which served him in his turn as a bedroom; and he realises, with a sensation of pain, that the very spot which was once his home, the scene of many an hour's toil, of many a good resolution destined to bear so little fruit—it may be of many a bitter disappointment, keenly felt, bravely struggled against, and manfully overcome—is now closed against him by right, and is in turn the home of one whose very name is strange to him, to whom also his own name and his own past life

are utterly unknown, save in so far as the college traditions may record his doings—now long past and insignificant in worth—in the cricket-field, the river, or the schools.

MY NEW FRIEND.

IN FOUR CHAPTERS.—CHAPTER I.

WHEN the sale was over, and the brokers had all gone— But stay! This seems rather too abrupt a style of commencing my story, as the reader may perhaps wish to know how it was we had the brokers in at all. Well, mine was an experience which is only too common, and was distinguished by no special features of romance, or even of pathos, although it was painful enough to me as well as to Susan, my wife.

My name is Matley—Luke Matley; a clerk in the city of London, plodding along pretty contentedly at a hundred and forty pounds a year; and I was engaged to be married to Miss Everett—the Susan just referred to—and our ambition being of a limited kind, our marriage was to take place when my salary was raised to one hundred and fifty pounds, which, at the time when I have decided upon commencing my narrative, I hoped would be in the next year. But unluckily—I may say so now, although I did not think so then—a distant relative, from whom I had entertained no expectations, died, and left me about a thousand pounds. Susan and myself, as I need hardly say, got married without waiting for the expected advance.

This would not have mattered so greatly, in fact it would have been the best thing I could have done, had we acted as we had originally intended, which was to have invested nearly the whole of this money in the purchase of a couple of little houses, and plodding on with my clerkship as before. But, as ill-luck would have it, I was in the wholesale wine-trade, and one of our travellers—a very clever fellow I always considered him, and so without doubt he was—had recently left, to set up in business for himself; and he showed me how it was possible to do much more good with seven or eight hundred pounds, than just to get a miserable five or six per cent. on house-property. I do not wish to dwell on this part of my story, so will only say that I invested my little fortune in the business; and at the end of the first half-year I received a dividend at the rate of twelve per cent. per annum. The second half-year was more successful still, a rather larger dividend being shown; and then, as assistance was required for the fuller development of the business, I gave up my clerkship, to take a more active position in the concern.

I was often surprised—at first almost shocked—at the style of people with whom our new business seemed chiefly to be transacted; they were, with scarcely an exception, vulgar, common people, and more given to drinking and smoking than is customary even in the wine-trade—as I had been used to it. Among them was one young man—he could not have been thirty—who used to come in frequently, and whom I at first disliked greatly; but my partner extolled him as the very impersonation of liberality and honour. His name was Scate, and I understood that he

represented an influential firm in the City. Whether my partner had spoken well of me to Mr Scate, in turn, I did not know, but the latter was always very courteous to me—after his style. I could hardly tell what he came for, but fancied, from occasional hints, that there were money transactions between him and my partner; but the latter always laughed off my inquiries, and said I should soon see what his business was. I certainly had an impression that, little as I liked the appearance of Mr Scate, he really did come on business, which was more than I could believe of many of our visitors, and was partly inclined to credit what my partner said of his extensive transactions.

Well, one day, five weeks after my last dividend was received, I found, on arriving at the office, a letter from my partner, regretting that circumstances altogether unforeseen, and entirely beyond his control, had compelled him to leave for America; he regretted also to say that the stock—which had been mysteriously disappearing of late—could not meet the demands and liabilities, and he advised me to put myself in communication with some experienced solicitor.

As soon as I recovered from the shock of such a letter, I did seek a solicitor; but in one respect I need not have troubled myself, for at least half-a-dozen experienced solicitors put themselves into communication with me, much to my discomfort. The case was such a bad one; so many people had been 'let in'; the trading had been so reckless, and the disposal of all the best goods so suspicious, that serious thoughts were entertained of prosecuting me for fraud; but this was happily abandoned.

I learned how near and great had been my danger, from a clerk who was in the employ of one of the hostile solicitors. He had scraped an acquaintance with me while serving me with writs and all sorts of processes and worrying notices; but he was always cheerful and jocular even over such work as *that*; and when drinking a glass of port in the deserted counting-house where the wretched business had once been carried on, exhorted me to cheer up also. 'You're all right, mister,' he said one day. [I forget what particular errand he had then come upon, I only remember that it was to serve me with something terribly threatening.] 'You're all right; I can tell you that.'

'I am glad to hear it,' I replied. Probably my tone was somewhat doleful, but I don't see how it could have been anything else.

'Oh, come! pull yourself together, Mr Matley,' said the clerk; 'you've had a narrow squeak, of course; but you're safe now. They won't try it on after all.'

'Try what on?' I naturally asked; for up to this time I had not suspected the existence of any such dangerous consultations as those of which I was so soon about to hear.

'Try what!' echoed the clerk, with a knowing shake of the head. 'Come, that's good, mister; I like to see a man carry it off like that.'

'Carry what?' I asked with some symptoms of annoyance.

The clerk, however, took no notice of my interruption, and proceeded: 'You know they thought they could have you up for conspiracy

and fraud. But old Judahson was your friend—he was. He stuck up for you all through. Says he—for I heard him—"There's no conspiracy there," says he; "the man's nothing better than a fool," he says; "you can all see that. Talk about conspiracy!" he says; "why, I don't believe he'll go out of the concern with enough to buy himself a glass of ale and a sandwich for dinner, when he steps over the door and we put the shutters up. The man hasn't got brains enough to be a rogue."—Well, you see, mister, we all knew, and they all knew, that old Judahson was as good a judge of what a rogue was as any man on the rolls; so naturally he had great influence. So he got you off in style; and I'm glad of it. There was, however, two or three there that didn't know the old man, and they were inclined to be nasty; but there was another party there who spoke up well in your favour. My eye! he did give it to some of 'em.

'Indeed,' I said. 'And who was he?'

'A friend of yours, I suppose,' answered the clerk; 'said he knew you well in the business. His name was Bate, or Crate—no! Scate—that was it. I thought he was going to let fly at one fellow. It was a game! But when I see what they have all done, it strikes me you won't have a brass farthing for yourself.'

My well-meaning although painfully vulgar friend was right. My creditors left me no farthings, or any other coin; and so total was the collapse, so utterly was I involved, that all the furniture worth speaking of at No. 9 Victoria Louisa Terrace, Kentish Town, was seized. Our home was stripped from top to bottom; bills were stuck all over the windows; auctioneers came, and brokers, and Jews, and shabby hangers-on—of every description, I was going to say; but they were indescribable. Sympathising neighbours came in too; not to buy, but to peep and quiz and titter; for I fear we had been considered stuck-up people, and it was felt that a little reverse was rather good for us than otherwise.

However, the sale took place; went off well, I was assured, for in most cases the goods fetched fully one-fourth of what I had given for them twelve or thirteen months before; and the auctioneer congratulated me. At last, all the hangers-on were gone, and the house was dull and void, save for the few things that were not seized, and for a few other articles which one of Susan's aunts had purchased back for our use. I had no near relatives. Susan's friends were quiet people, occupying a small farm in a Welsh inland county; and we determined not to trouble them; so this aunt, who lived in London on a small annuity, was the only one who knew of our downfall. She, then, was the only friend we expected to find at our sale; but, to our surprise, another one turned up in the person of my former acquaintance and recent champion, Mr Scate. Not only did he appear at the sale, but came up to me, and calling me 'old fellow,' said he was sorry to see such goings-on in my house, that he knew all about the doings which had led to it, and considered I had been scandalously used.

Little as I had liked the man before, I remembered his exertions with my creditors on my

behalf, and was melted by his sympathy now; so warmly shook the hand he extended. 'Now, old boy,' he continued, 'what would you like me to buy in for you? Just say the word, and it's yours, even if I have to kick the whole of these swindlers out of the room to get it.'

I was more staggered than ever at this question, and could hardly get out my answer, that I would not trouble him.

He cut me short here. 'Trouble! nonsense! No trouble at all. I'll get something back from their claws.—There! he is just putting up that marble clock, and hark! that hook-nosed old villain has bid fifteen shillings for it! Why, it must be worth ten times as much.' With this, he began bidding; and his style, I may even say his swagger, was so impressive, that the men allowed him to have the clock for thirty shillings; while I am convinced they would have run it up to treble the money with any other stranger.

So the sale was over; the brokers and all the attendant vampires had gone; the carts, which had been standing about all the afternoon, were gone also; but the marks of muddy feet over all the rooms and on the staircase were not gone, nor were the wisps of dirty straw which lay in every corner and behind every door.

My wife and myself were sitting in what we called our breakfast-room, which looked out on the little sloping front garden with which all the houses in Victoria Louisa Terrace were furnished. Not that we were looking out then; for the gas was lighted, the blinds were down, and we were seated, talking sadly enough, in the room, which seemed so bare and wretched compared with its aspect of a day or two before. I pretended to bear up confidently, for I saw poor Susan's eyes fill with tears when she looked at the naked boards where had been such a comfortable dark carpet; or glanced at the common wooden chairs and table bought back out of our kitchen furniture, and now forced to serve instead of our plain but handsome leather-covered seats. She tried to hide these tears from me, and every time she caught my eye she smiled; but her lip trembled so in the effort, that it was almost worse than the burst of sobbing she was trying so hard to keep back. The solitary item which reminded us of our previous comfort and smartness was the marble clock, which ticked on the mantelpiece; and we had already said two or three times over, how greatly obliged we ought to feel to Mr Scate for his kindness.

I have said I pretended to bear up cheerfully; it was all pretence, for nothing could be more utterly hopeless than were our prospects; and what made us more miserable than we should otherwise have been, was what had previously given us great joy. Susan expected to have a baby in about a couple of months, and what were we to do then? Before that time arrived, it was clear that we must find another residence, for quarter-day would come, and it was hopeless to think of going on where we were. Our present house was large enough to justify us in letting one floor—the card, indeed, with the simple announcement 'Apartments,' still hung idly in our window; but where was the furniture to come from?

'Don't you think, dear,' said my wife, trying to speak without a catch in her voice, 'that we

might buy some plain furniture from people who will take monthly payments, and so'—

I shook my head as she paused, for this was only another danger, a fresh running into debt.

'Perhaps, then, dear,' she resumed, 'some firm might take you as a traveller. I have heard that some persons make a great deal of money in that way.'

I shook my head again. Some persons, no doubt, did well; but I knew better than she did, the long, slow, hopeless task it was for an unknown man to form a new connection. 'The fact is'—I began; when a loud double knock at the street door interrupted me.

My wife turned pale; so did I, as Lizzie, our little servant, ran to the door. Lizzie had begged her mistress not to send her away just yet; for, as she said, she 'had been in a many houses where they was sold up, and so didn't mind it;' and added, that she would rather stay with us for her 'vittles, nor go anywhere else for wages;' so she stayed. When Lizzie had opened the door, we heard some one inquiring for Mr and Mrs Matley. The servant's reply was inaudible; but the voice said: 'Down-stairs, are they? All right; don't you trouble 'em; I'll find them out; they won't mind an old friend intruding.' Then followed a step on the stairs, a tap at our room door, and then the well-known figure and face of Mr Scate became visible.

'Aha! you did not think of seeing me!' he exclaimed.—'No! I thought not; but I got home early, and I couldn't rest without coming round.—Your servant, Mrs Matley. I ought to apologise for intruding like this; but I know you will excuse me. I am a plain man. Everybody knows me; and Ned Scate is here to say that he never heard of such scandalous treatment as your husband has met with, ma'am. That's what I am here for.'

Although the man's voice, air, and manner altogether were terribly vulgar, there was no resisting this; at anyrate Susan could not resist it, and her tears broke out in earnest, and thanking him warmly, she invited him to be seated and stay a while with us.

'It's what I came for, ma'am, if you will excuse my saying so,' replied Mr Scate. 'I came to talk things over with Mr Matley—and of course yourself—and to see if we can't do something to make matters straight. I'm in rather a large way of business myself, and have friends who are very influential. They could make room for a dozen like Mr Matley, and be glad to get such men. Yes, ma'am, glad to get them, for men like Mr Matley are not to be found at the corner of every street. I saw him in business, ma'am; I know what he is capable of, and will take care that others know it too.'

'I am sure I don't know how to thank you for this disinterested kindness,' began my poor wife; 'to strangers too, who'—

'Then don't thank me, ma'am,' bluntly interrupted the other—'don't thank me, at anyrate till I have done something more than talk about my good-will. As for being strangers, ma'am, I don't intend to remain a stranger any longer. This is not a time to stand on a lot of ceremony, and Ned Scate never cared about ceremony. He's a plain John Bull, he is.—And

now, governor'—this was of course to me—'though Mrs Matley probably don't go in for such things, I have taken the liberty of bringing round a single bottle of sherry. If the quality can be beaten in all London, I can only say I have never seen the quality to beat it.'

Suiting the action to the words, he drew from one pocket of his long overcoat, which was white or drab, and made him look like a grazier, a bottle of sherry; and then he produced a knife with a number of blades and odd appurtenances, among others a corkscrew.

All this was utterly opposed to our habits. We cared not for drinking at all, save at our meals; and wine we drank but rarely. We, however, were hesitating, and restrained by a fear of seeming ungrateful to our new friend. He had no sort of hesitation about him; so, while we faltered, he had called Lizzie the servant, who at his command brought two out of the few odd tumblers which were left, with a wine-glass.

'Depend upon it, ma'am,' said he, as he handed the glass to my wife with his politest air, in which—ungrateful as I felt it was to notice it—I could not even at that moment refrain from seeing something of a swagger—'depend upon it that the worst thing you can do is to give way. I am sure if you keep up, your husband will keep up also. Why, ma'am, I have been in fixes twenty times worse than this, twenty times over, and I have got out of them—and here I am! my own master, and caring for nobody.—And now, ma'am!' continued Mr Scate, 'I have much pleasure in drinking your health, with prosperity to you and your worthy husband. Why, in days to come, we shall have many a laugh over these times.—Your very good healths, both!—You must not think, ma'am,' continued our visitor, 'that I have intruded upon you for nothing, or just to say a few unmeaning words; far from it. As I told you before, I have heard all about the shameful way in which Mr Matley has been treated, and I have spoken to some friends already in his behalf. I hope you will not think it was taking too great a liberty.'—My wife assured him that he added to the obligation by doing so.—'And I am pleased to tell you, ma'am,' he went on, 'that there is something more than a chance of an opening. I am not authorised to make an offer to-night, and therefore, looking at the matter purely in a business light, I ought to have said nothing about the affair until I was so authorised. But—if you will excuse my saying so—I was so shocked at seeing these goings-on, that I could not keep silence, and I thought you would be so dispirited at such misfortunes, that you would be glad of even a glimpse of hope.'

'Glad of it!' I said; 'I am more than glad. I do not know how to thank you sufficiently for the interest you have taken'—

Just then came another loud double knock, and, as before, we heard Lizzie open the door, and a short conversation followed; then coming to the breakfast-room door, she said: 'Oh, if you please, mum, it's a gentleman as wants to see the apartments.'

'See the apartments?' we both echoed. 'Oh, he can't. Tell him, Lizzie'—

'No, no!—nonsense! Excuse me for the interruption,' said our new friend; 'but if I were you, I should have him in, and see what he is like; I should indeed. It may come to nothing, of course; but it's a chance, and my maxim in business is, never to throw a chance away.'

MUSICAL FISHES.

WHEN Humboldt was in the South Sea in 1803, about seven o'clock one evening (the 20th of February) an extraordinary noise startled the crew. At first it was like the beating of a number of drums in the distance, and then in the ship itself, especially near the poop. They thought it might be the breakers, and again they fancied the vessel must have sprung a leak. It continued to be heard without intermission for a couple of hours, ceasing entirely about nine o'clock. Humboldt did not conjecture the probable cause of the phenomenon.

Lieutenant White, of the United States navy, in an account of his Voyage to the China Seas, published in 1824, mentions a somewhat similar experience. When at the mouth of a river in Cambodia, he and his crew were astonished by some extraordinary sounds which were heard around the bottom of their vessel. 'The sounds,' he says, 'were like a mixture of the bass of the organ, the sound of bells, the guttural cries of a large frog, and the tones which imagination might attribute to an enormous harp.' The ship seemed almost to tremble with the vibration. 'These noises increased, and finally formed a universal chorus over the entire length of the vessel and the two sides.' They diminished as the ship sailed up the river, and ceased altogether after a time. The interpreter who accompanied Lieutenant White attributed them to a troop of a certain kind of fish, 'which has the faculty of adhering to divers bodies by the mouth.'

The following, by Dr Buist, appeared in the *Bombay Times* of January 1847: 'A party lately crossing from the promontory in Salsette called the "Neat's Tongue," to near Sewree, were, about sunset, struck by hearing long distinct sounds like the protracted booming of a distant bell, the dying cadence of an Æolian harp, the note of a pitch-pipe or pitch-fork, or any other long-drawn-out musical note. It was at first supposed to be music ashore floating at intervals on the breeze; then it was perceived to come from all directions, almost in equal strength, and to arise from the surface of the water all around the vessel. The boatmen at once intimated that the sounds were produced by fish, abounding in the muddy creeks and shoals around Bombay and Salsette; they were perfectly well known, and very often heard. Accordingly, on inclining the ear towards the surface of the water, or, better still, by placing it close to the planks of the vessel, the notes appeared loud and distinct, and followed each other in constant succession. It is supposed

that the fish are confined to particular localities—shallows, estuaries, and muddy creeks, rarely visited by Europeans; and that is the reason why hitherto no mention, so far as we know, has been made of the peculiarity in any work on natural history.'

Two years later, another letter appeared in the same journal stating that 'musical sounds like the prolonged notes on the harp' had been heard to proceed from under water at Vizagapatam.

Sir J. Emerson Tennent having heard a story about musical sounds issuing from the lake at Batticaloa, in Ceylon, paid a visit to the place in 1848. The fishermen told him that the sounds, which resembled the faint sweet notes of an Æolian harp, were heard only at night and during the dry season, were most distinct when the moon was nearest the full, and proceeded, they believed, not from a fish, but from a shell called the 'crying shell.' 'In the evening,' says Tennent, 'when the moon rose, I took a boat, and accompanied the fishermen to the spot. We rowed about two hundred yards north-east of the jetty by the fort gate; there was not a breath of wind, or a ripple except those caused by the dip of our oars. On coming to the point mentioned, I distinctly heard the sounds in question. They came up from the water like the gentle thrills of a musical chord, or the faint vibrations of a wine-glass when its rim is rubbed by a moistened finger. It was not one sustained note, but a multitude of tiny sounds, each clear and distinct in itself; the sweetest treble mingling with the lowest bass. On applying the ear to the woodwork of the boat, the vibration was greatly increased in volume. The sounds varied considerably at different points, as we moved across the lake, as if the number of the animals from which they proceeded was greatest in particular spots; and occasionally we rowed out of hearing of them altogether, until, on returning to the original locality, the sounds were at once renewed. This fact seems to indicate that the causes of the sounds, whatever they may be, are stationary at several points; and this agrees with the statement of the natives, that they are produced by mollusca, and not by fish. They came evidently and sensibly from the depth of the lake; and there was nothing in the surrounding circumstances to support the conjecture that they could be the reverberation of noises made by insects on the shore conveyed along the surface of the water; for they were loudest and most distinct at points where the nature of the land, and the intervention of the fort and its buildings, forbade the possibility of this kind of conduction.'

The next witness is a gentleman signing himself 'Ubique,' who wrote to the *Field* newspaper of October 26, 1867, as follows: 'On embarking on board the *Danube* steamer, lying at anchor in the roadstead of Greytown (Central America), on the 12th May 1867, I was informed that the ship was haunted by most curious noises at night since she had arrived, and that the superstitious black sailors were much frightened at what they thought must be a ghost. The captain and officers could make nothing of it, and it afforded a great matter for discussion. On inquiry, I found that other iron ships had been similarly affected. Curiously enough, this noise was

only heard at night and at certain hours. Some attributed it to fish, suckers, turtle, &c.; others, to the change of tide or current; but no satisfactory conclusion could be arrived at. When night came on, there was no mistake about the noise; it was quite loud enough to awaken me, and could be heard distinctly all over the ship. It was not dissimilar to the high monotone of an Æolian harp; and the noise was evidently caused by the vibration of the plates of the iron hull, which could be sensibly perceived to vibrate. What caused this peculiar vibration? Not the change of current and tide, because, if so, it would be heard by day. Like everything else that we cannot explain, I suppose we must put it down to electricity, magnetism, &c.'

This letter drew forth one from another correspondent, who stated that one moonlight night in 1854, when on board a steamer anchored near the Tavoy river (Tenasserim), he and others 'were struck by an extraordinary noise which appeared to proceed from the shore about a quarter of a mile off, or from the water in that direction. It was something like the sound of a stocking-loom, but shriller, and lasted perhaps five or six seconds, producing a sensible concussion on the ear, like the piercing scream of the cicada; and this gave an impression as if the vessel itself were trembling, or reverberating from the sound. One or two Burmans on board said simply the noise was produced by "fishes;" but of what kind they did not describe. It was repeated two or three times.'

Three years later, in the same locality, a 'droning, drowsy sort of sound' was heard at nightfall by a correspondent of Hardwicke's *Science-Gossip*. It seemed to be above, below, and around. 'The air was all sound, and the sound was all of one kind and pitch.'

We now come to the evidence of Mr Dennehy, given in a letter anent 'Strange Noises heard at Sea off Greytown,' published in *Nature* of May 12, 1870. His statement is the more valuable because he seems to have been unaware of previous observations upon similar 'strange noises' elsewhere. 'I have never heard of its occurring elsewhere, and I have made many inquiries,' he says. The facts recorded are briefly these. The *Wye*, *Tyne*, *Eider*, and *Danube* were iron-built vessels; the *Trent*, *Thames*, *Tamar*, and *Solent* were coppered-wooden vessels, which all, at one time or another, anchored off Greytown. The former were haunted by the strange sounds; the latter knew nought of them. They were heard at the Greytown anchorage only. Punctually about midnight the concert began, awakening nearly the whole crew, and it invariably continued for the same period—namely, two hours. The sound is described as 'musical, metallic, with a certain cadence, and a one-two-three time tendency of beat. It is heard most distinctly over open hatchways, over the engine-room, through the coal-shoots, and close round the outside of the ship. It cannot be fixed at any one place, always appearing to recede from the observer. On applying the ear to the side of an open bunker, one fancies that it is proceeding from the very bottom of the hold. Very different were the comparisons made by the different listeners. The blowing of a conch-shell by fishermen at a distance, a shell held to the ear, an Æolian harp, the whir or buzzing

sound of wheel-machinery in rapid motion, the vibration of a large bell when the first and lower part of the sound has ceased, the echo of chimes in the belfry, the ricochetting of a stone on ice, the wind blowing over telegraph wires, have all been assigned as bearing a more or less close resemblance. It is louder on the second than the first, and reaches its acme on the third night. Calm weather and smooth water favour its development. The rippling of the water alongside, and the breaking of the surf on the shore, are heard quite distinct from it.' The English sailors attributed the phenomenon to what they called the trumpet-fish—a fish of their own invention, for the real trumpet-fish (*Centriscus scolopax*), so called from the shape of its jaws, does not exist in those waters.

In all the cases yet adduced, the observers, it will be noticed, were on board ships or boats of some kind. Canon Kingsley, however, relates that he more than once heard the noise from the shore, in the island of Monos, in the Northern Bocas of Trinidad. 'I heard it first about midnight, and then again in the morning about sunrise. In both cases the sea was calm. It was not to be explained by wind, surf, or caves. I likened it to a locomotive in the distance rattling as it blows off its steam. The natives told me that the noise was made by a fish.' He tells us that it is frequently heard at the Bocas, and at Point à Pierre, some twenty-five miles south; also outside the Gulf along the Spanish Main.

Finally, while the phenomenon is most commonly met with in tropical seas, it is not unknown in the temperate zone. Mr Lauder Lindsay heard it in 1869 while on board a steamer anchored in the Tagus, off Lisbon. The ship's officers told him that it was produced by a fish, and was only heard at certain states of the tide.

More instances might be brought forward, but we think we have quoted enough. Let us now endeavour to generalise our facts as well as we can.

First, as to the geographical distribution of the phenomenon, we find that it has a most surprising range. In the Western hemisphere it has been heard at the mouth of the Pascagoula, in the state of Mississippi; at the mouth of the Bayou Coq del Inde, on the north shore of the Gulf of Mexico; at Greytown; at Trinidad; at Caldera, in Chili; and at several places on the Pacific coast of South America. It is thus known at wide intervals along the entire coast of tropical America. In our own half of the world we find it occurring on the coast of China; at Tavoy, in British Burmah; at Vizagapatam, on the east coast of the Indian peninsula; at Salsette, on the west coast, and at the Chilka Lake, on the east coast, of Ceylon; near Colombo, on the west of the island; in the Bay of Naples, in the Mediterranean; and at Lisbon, on the Atlantic coast of Europe. Whatever the source of the sounds, then, it must be of general distribution throughout the tropical regions of the globe.

Next, as to time—it is noticeable that the sounds are invariably heard at night; sometimes about sunset, never before it. The two-hours' period noticed by Mr Dennehy is also mentioned

by Humboldt. Some observers describe the noise as continuous; others, as intermittent.

Although in the Greytown instances iron ships only were affected, we have abundant cases of the phenomenon being observed by those in wooden vessels. The materials of the ship, and for that matter the ship itself, would seem to have nothing to do with the production of the sound. Of course, the ship's frame may act, as any hollow body would, as a sounding-board, and thus give greater strength and amplitude to the aerial vibrations.

In most cases, the phenomenon occurs in salt or brackish water. But it has been known to occur in fresh water. So we can argue nothing from the nature of the water.

Lastly—and this is the only generalisation that we can fairly draw from the observations yet recorded—the sound is usually heard at or near the mouths of rivers.

It was perhaps this sweet and pleasing sound that gave rise to the myths of mermaids and sirens. The mariners of old, who never ventured beyond their own coasts, would be quite as likely to hear it as we are; for there is no instance on record of the music being heard at sea; and with their usual facility in inventing a pretty and poetical cause for everything, they would soon find authors for the dulcet tones in nondescript beings dwelling in submarine caves and grottos. The fishermen and sailors of our own day almost universally ascribe the sounds to fish. At Lisbon it is the 'corvina,' whatever that may be; at Baltimore it is the 'cat-fish;' in the West Indies it is the 'trumpet-fish;' in Ecuador it is the 'siren' or 'musico;' at Naples it is the 'maigre' or 'drum-fish;' in Ceylon it is not a fish at all, but the 'crying shell;' and so on.

The exact evidence at hand from the domain of natural history respecting the sounds emitted by fishes, does not perhaps fully satisfy the cravings of the student of natural history, for the reason that such evidence is both difficult to obtain, and, as the foregoing remarks have shown, also presents puzzling points for determination in the matter of the causes of the sounds. Dr Dufossé, who has made the production of sound by fishes a special study, says that whilst many fishes produce sounds, there is great variety in the manner in which the noises are evolved. Thus the movements or friction of the pharyngeal bones, and the vibration of the muscles of the swimming-bladder, which acts as a sounding-board, are two common methods of sound-production in fishes. We know that one of the Gurnards (*Trigla*) produces loud sounds, ranging, as Mr Darwin remarks, nearly over an octave, by means of the intrinsic muscles of the swimming-bladder. More curious, however, is the case of fishes belonging to the genus *Ophidium*. Here, the male fishes alone are provided with a drumming-apparatus, consisting of bones and muscles developed in relation to the swimming-bladder. In the *Umbrinas* ('Corvo' of the Italians, 'Umbrine' or 'Ombre' of the French), the drumming sounds are produced apparently also through the medium of the swimming-bladder. These fishes have been heard at a depth of twenty fathoms. The Rochelle fishermen say that the noise is produced by the males alone. They also allege that these fishes

can be taken by imitating the noise, especially during the spawning season. Even with all this, however, much remains to be explained regarding these curious submarine sounds heard in various localities and at various times.

SAVED BY BULLOCKS.

A SOUTH-AFRICAN EXPERIENCE.

THE incident here narrated took place while the author was residing on the farm of a hospitable Dutchman, who for some years had conducted a good, safe, and profitable business in Cape-Town. But as being cooped up all day in a dusty office was not in accordance with his views of freedom, he left it, to turn his hand to the more simple, if not more profitable career of a farmer, in which he could indulge his love of freedom.

The way in which I became acquainted with Pietermann was this. For some months I had been down with fever, contracted under the combined effects of exposure to a tropical sun, and the irregular mode of life which I had for some time been accustomed to. As soon as the doctor pronounced me strong enough to walk, he gave me marching orders to remove to a more congenial district. So away I went to a village some hundred and fifty miles distant, where the fresh air and strength of body which I so urgently required were to be had. On arriving at the village, I put up at the only hotel in the place, and it was here I made the acquaintance of Mynheer the Dutchman. One evening, while sitting outside under the veranda of the hotel, Pietermann drove up to have his 'liquor,' and attracted no doubt by my thin, pale, worn-out looks, asked me how I was in health. We soon fell into an affable chat, as I found him a man of very interesting experiences. Dutchmen are a kind, good-natured, and polite people, ready at any time to give a helping hand to any worn-out and dejected foreigner. In the course of half an hour, therefore, I gradually unfolded to him my plans; and immediately, with that hospitality so general to the South African Boer, he invited me down to his farm, distant some thirteen miles. I hesitated, but told him I would give him my answer in a couple of days. The time came, and I decided to accept his offer with many thanks. He having come up to the village with produce, I saw him, and gave him my answer; and in the afternoon, we commenced our journey to the farm.

When we were fairly en route, I began, with an Englishman's inquisitiveness, to ask about sport. 'What game is there to be had on the farm?'

'Ah!' said he, turning round with a merry twinkle in his eye. 'Sport; well, no doubt I shall be able to find enough for you.'

I inwardly rejoiced at this; but my joy was suddenly cut short.

'O yes; there are any amount of rats, and I shall be glad if you would clear them out.'

Rats! Was I going to a Dutchman's farm to shoot rats? 'But surely,' said I, 'you have something worthy of the name of game?'

'Yes; no doubt we have,' he replied; and after bantering me a little, he said I should be able to gratify my desire for sport. 'There are jackals in the mountain, springboks on the flats, bush-

bucks in the bush, and perhaps a stray tiger or two [the Cape leopard]. Besides these, you will have plenty of birds to go at.'

So I found that, after all, I should not be so badly off as at first appeared.

By this time we had reached the farm, where we were welcomed by the wife and a whole troop of daughters. Before I had been there many days, I was wearied of the daily routine of the house, which was extremely monotonous; and I welcomed the day when I should be strong enough to take my rifle and saunter away in search of game.

One morning, however, my host informed me that he had all but bought three hundred sheep, and intended the next day to go and complete the purchase at a farm about thirty miles away. He asked me to accompany him; which I readily promised to do, as I knew that I should be able to get a glimpse of Nature in her loveliest garb, and perhaps a stray shot or two at some animal. All that day, we were preparing for the proposed journey; for we had various mysterious articles, which were indispensable on such an expedition, to take with us.

Next morning at four o'clock, I was roused by a friendly shake, and told to dress as quickly as possible. I made a hasty toilet, and hurried out to the *stoep*—a raised platform in front of the house—and took my seat in the cart, in which were inspanned or harnessed two horses. These carts are something similar to our own, but very much lighter, and made without springs, hence one can imagine the terrible jolting a person receives when riding in such a vehicle, without cushions, over hard stony ground, at full gallop, for a Dutchman never thinks of letting his horse walk. For discomfort, let me have the genuine Cape cart.

After innumerable hand-shakes and 'qua-morrows'—for this constitutes a never-failing portion of the proceedings when going away, be it but for a few hours—we started off, and before breakfast-time were halfway towards our destination. After staying a short time at a village on the way, we reached the place where Pietermann had purchased the sheep, nothing of any consequence happening beyond our seeing a few monkeys and an eagle, the latter, however, beyond range. Before we had been at the farm ten minutes, all was bustle; the sheep had to be counted, then caught, marked with the monogram of the buyer—no easy work under a sun which marked pretty near ninety-five degrees in the shade. However, this, by the help of a dozen Hottentots, was done, and after partaking of refreshment, we, about four p.m., turned our horses homeward. With the object of showing me some wonders of which my host had spoken in the morning, we agreed to return home by a nearer though more dangerous route.

About six p.m. we reached a small hamlet, and here we must outspan. As is usual in every village, there was an hotel, and this we entered. Up to this time, I had thought Pietermann was a moderate drinker, but very soon I was undeceived. Glass after glass of Cape *smoke* or brandy did he toss down his throat, till he soon became very much affected by it. It was now close upon eight o'clock, and we had a dangerous route to traverse ere we reached home, and there was every appear-

ance of a storm. When, therefore, he insisted on starting for home, I tried to persuade him to remain all night. But, no; the more I pressed the more determined he was to proceed. After several fruitless efforts, we inspanned the horses and brought them round to the hotel door. The landlord—an Englishman—came to me and said: 'I don't like the idea of your going home with Pietermann round the "Nek." Will you stay all night?' 'No,' I said. 'If Pietermann will persist in going, I will go with him.'

He returned me no answer till I was seated in the cart; then he whispered and said I should have to be very careful, as there were several places which were exceedingly dangerous, but one especially, called 'Slagters Nek,' so named on account of a dreadful slaughter of troops by natives, years before. For two hundred yards, I was told, this road runs parallel with a precipice, then there is a sharp bend, at which I would have to be careful, or we might go over. 'But keep the horses well in hand,' said my adviser, 'and you will be all right.'

Pleasant advice to one who had never travelled the road before, and with two strong vicious animals, and an inexperienced driver like myself. But I put a bold face upon matters, and said I should get through all right. The horses were, strange to say, extraordinarily frisky. Whether it was that they had had too much corn and too little work, or that they knew they had a strange driver, I do not know; but true it was, they were like two horses which had never been in harness before. Into the cart tumbled the Dutchman, with the help of the bystanders, and off we started like a whirlwind, with a caution from all present.

Many had been the comments upon the Englishman bold enough to drive old Pietermann's horses; and from what I could gather from their conversation—carried on in Dutch, yet partly understood by me—none of them much envied me the drive through B—Kloop and round the 'Nek.' But on we went till the entrance of the 'Poort' was gained. Here nature had been very busy, making it a complete network of fortresses, and had so hemmed in the inhabitants, that it was no light task to get out. In seeking to reach the other side of the mountains, instead of going in a straight line, they were compelled to go along the base of one hill, then round a bend, back again, and so for miles ere they reached their destination. For three miles through the 'Poort,' it was comparatively easy to travel; but the remaining ten was a regular series of chasms, boulders, and river-beds, making it unsafe for one unacquainted with the road to travel. In some places you would have a plateau to cross; at another, as if to vary the monotony, there would be a huge yawning chasm to pass; and, to crown all, a road at the utmost extent sixteen feet wide.

In passing, these chasms, travellers had to be very careful, or an unlucky move would precipitate them over the brink. Every few yards, there were huge rocks, some of which had been dislodged from the mountain side by the rain, and thence rolled into the road. Those in the river-beds had been brought down by the fearful velocity of a tropical storm; and these are rarely, if ever removed, as the Dutchman thinks it too much labour, though he may pass and repass a

ten times a week. These stones present very serious obstacles to the passage of any light vehicle. About half-way through this 'Poort' was the dreaded 'Slagters Nek'; and in turning the sharp bend, care had to be exercised to avoid finding a lodgment in the chasm, which was three hundred feet in sheer descent below.

We had now reached the entrance of the 'Poort,' and were trotting leisurely along, the horses having calmed down somewhat. I had thus far managed to avoid serious contact with rocks and boulders, and as I journeyed over the first three miles, with the moon shining brightly, for the storm had passed away, I felt more light-spirited than I did at the outset. The stupid Dutchman in the cart with me was now sound asleep. No jolting had awakened him, so securely was he wrapped in slumber. But the beauty of the scene made me forget all this. On each side were to be seen the silent mountains; before me, far away, was a flowing stream, glistening white in the moonlight; while now and then might be heard the sharp bark of the jackal or the sudden chatter of birds. I was now about a mile from the 'Nek,' and I drew up the horses that I might drink in the scene more vividly. Standing up in the cart, I gazed around me, in order to fill myself, as it were, with the beauty and grandeur of the scene, when I was suddenly startled by a loud growl, quickly followed by a second, louder still. It was a Cape leopard. I felt my hair rise. To seize my rifle and discharge it was my first thought; but it was underneath my friend at the bottom of the cart. Ere I had time to seize it, I was jerked into my seat. The horses were galloping, wild with fear and excitement, straight for the 'Nek.' I seized hold of the reins, which had been dragged from my grasp, and pulled with all the energy of a man in despair. But I might as well have sat still; for all my pulling was without effect. On they dashed over rocks and boulders, impelled by their wild fear; while I was expecting every moment to be hurled into the chasm below. I made another effort; but it was equally fruitless. I was in imminent danger of being jerked off my seat, and had now to use all my strength to keep my hold of the cart. Still on they rushed, and no help for it. I grew deathly calm, waiting for the doom which seemed so near. We tore on at racehorse speed, nearer, nearer. Now the dark wall of the 'Nek' was distinctly to be seen looming before us.

'Help!' I shouted, more in agony than with the idea of any one hearing me; yet one heard, though I knew it not. 'Help!' again I cried.

I dare not think of it. On, on! I closed my eyes. There was a sudden jerk; I felt myself pitched headlong out of the cart, and—I knew no more.

Saved! But how? On the opposite side of the 'Nek,' was toiling up the rather steep ascent, a Dutchman with his bullocks and wagon, returning from a far-off village, where he had been to sell his produce; and as he lay half asleep, he was suddenly aroused by the cry of 'Help!' At once the thought flashed through his mind that some one was in danger at the 'Nek.' He was but a few hundred yards away, so the usually unwieldy, slow, and phlegmatic Dutchman jumped from the wagon, seized the whip, and

commenced belabouring the poor oxen till they started on a run, passed the bend, when he at once saw my peril. No time was to be lost, so he drew up the oxen across the path, and was in time to receive the full force of the collision.

Yes; I was safe. Could I believe it? I had been for a few minutes unconscious; but the kindly Dutchman's flask had revived me, and here I was. My first thought was for my companion; and, strange to say, there he was still lying at the bottom of the cart, quite unconscious of the risks he had run. The horses were not, beyond a few scratches and bruises, any the worse for their race.

After this, we journeyed slowly home, for the horses were now thoroughly cowed; and when we reached the farm, we were received with open arms, as the family were frantic with fear, knowing not what had become of us. When I related how narrow had been our escape, there were abundant expressions of gratitude. I have travelled since then in various parts of the world, and have gone through perils by land and sea, but never shall I forget my terrible ride with Pietermann and our being saved by bullocks.

SONG LESS.

SWEET little maid, whose golden-rippled head
Between me and my grief its beauty rears,
With quick demand for song—all singing's dead;
My heart is sad; mine eyes are dimmed with tears.

Oh, ask me not for songs! I cannot sing;
My ill-tuned notes would do sweet music wrong;
I have no smile to greet the laughing spring,
No voice to join in summer's tide of song.

More from October's dying glory takes
My heart its hymn; and fuller sympathy
Finds with the Autumn hurricane that makes
The forest one convulsive agony.

Or, when the last brown leaves in Winter fall,
While all the world in grim frost-fetters lies,
I envy them the snowflake's gentle pall,
That hides their sorrows from the frowning skies.

Methinks it would be sweet like them to rest—
O'er Life's mad scene to pull the curtain down;
Rest, where no weary dream will pierce the breast,
Of perished love or unfulfilled renown:

No weariness of patient work uncrowned
By its reward; no early hopes destroyed;
No vain desires, nor thing desired and found
Void of enjoyment when at last enjoyed.

Perchance when mist of intervening years
Softens the Past—as oft at close of day
The far grim range all beautiful appears,
Kissed into brightness by the sunset ray—

When the sharp pang of bitter memories born,
Has lost its sting, and this my present pain
Shows like some ill dream in the light of morn,
I'll sing thee o'er the olden songs again.

BRAIN-POWER.

WE are supposed to live in an age when brute-force has ceased to rule, and when brain-power alone is the governing agent. In the good old days, the heavy, strong-armed knight, protected by his impenetrable armour, and skilled in the use of his sword, was almost invincible. A little nearer our own day, the skilled swordsman or dead-shot whose ultimatum was the duel, ruled to a certain extent the society in which he moved. To test which was the most powerful knight, was an easy matter; for a combat between the rivals was easily arranged, and the result was seldom questionable; or if it were uncertain, the relative powers were supposed to be equal.

In the present day, however, the question of brain-power is a far more difficult problem. We cannot weigh brains as we can tea or sugar; we cannot determine their mental capacity as we could the physical powers of knights of old, by setting two of them opposite each other and leaving them to fight it out. We have, however, arranged various tests which we suppose give us a correct estimate of the brain-power of various individuals. These tests may be better than none at all; yet they are far from being perfect; consequently, we too often by such means select men to do work for which they are quite unsuited, and to fill offices for which they have no capacity.

The present is an age of competitive examinations, yet these afford but an imperfect test of brain-power; for after a time, competitive examinations become less and less efficient as true tests of intelligence, and sink into a sort of official routine. As examples, we will take the following cases. Brown is the son of an Indian officer who died when his boy was ten years old, and left his widow badly off. Young Brown is intended for the Royal Military Academy, Woolwich; but his mother's means do not enable her to send him to a first-class 'crammer's,' so he has to sit beneath the average schoolmaster. He works hard and thinks a great deal, and gains a fair

knowledge of the subjects he is required to learn. He goes up to the competitive examination at Woolwich, and finds each question so complicated, that he is utterly puzzled; and when the results of the examination are made known, Brown is nearly last on the list.

On the other hand, Smith is the son of a wealthy tradesman who wishes his son to enter as a cadet at Woolwich. Young Smith is sent early in life to a successful 'crammer's,' to be fattened with knowledge as turkeys are crammed for Christmas. The crammer does not confine his attention to teaching his pupils; but he watches the examination papers set at Woolwich, and he finds that the examiners have each a peculiar 'fad,' and set their questions in a sort of rotation. He looks carefully over these, and he forms a kind of estimate of the questions which are likely to be set at any particular examination. He therefore trains his pupils for these questions, and is often so successful in his predictions, that at least half the questions have been worked out by these pupils a week before the examination; and this result is obtained without any collusion between the crammer and the examiner. On one occasion that we know of, seven questions out of a paper of thirteen were predicted as 'due;' and the pupils consequently of this crammer were most successful at this 'competitive.' Young Smith is thus trained, and passes say fifth out of a long list, and is considered, as far as this test is concerned, to possess brain-power far beyond that of the unfortunate Brown, who was nearly last in this same examination.

Twenty years elapse, and Smith and Brown meet. Smith has jogged on in the usual routine; he may have never either said or done a foolish thing. Brown, on the other hand, is a man of wide reputation, has written clever books, and done many clever things; yet people who know his early history say how strange it was that he was so stupid when he was young, for he was ignominiously 'spun' at Woolwich!

Those who thus speak, imagine that the

examination at which Smith succeeded, and Brown failed, was a test of their brain-power. It was in reality nothing of the kind; it was merely a test of the relative experience of those who named Smith and Brown.

Even, thus far it will be evident that our present supposed tests are not infallible; but we will go even further, and will examine the actual work itself which is supposed to be the great test of mental capacity, and we can divide this work into two classes—namely, acquired knowledge, and the power to reason. In nearly every case, the training which enables a youth to pass a competitive examination belongs to the first class—acquired knowledge. It consists of a knowledge of mathematical rules and formulæ, classics, modern languages, history, and geography. Mathematics, if properly taught, and especially geometry, tends to strengthen the mind and fit it to reason; but it too often happens that a youth is crammed with mathematics for a particular examination, and he has not mentally digested what he has thus been crammed with; and consequently, instead of his mind having been strengthened by this process, it has in reality become weakened; and ten or fifteen years after the examination, the man—then in his maturity—derives no advantage from his formerly acquired knowledge, because he has forgotten it. He merely suffers from the mental repletion of his younger days, and dislikes mathematics; just as a pastry-cook's boy is said to abhor tarts and buns, because he was crammed with them when he first was placed among such temptations.

A knowledge of modern languages is useful to those who travel, or who wish to become acquainted with the literature of other countries; but as a test of brain-power, the acquisition of any language fails. There is no language in use which is based on anything but arbitrary rules; reason has no influence on languages. The selection in French, for example, of masculines and feminines is most unreasonable. Why should a chair in French be given petticoats, and a stool placed in breeches? Why should the sun be considered masculine, and the moon feminine? In German, the same arbitrary rules exist—the masculines, feminines, and neuters have no reason to guide them. Take a child of five years old, and a clever man of twenty-five—let each use only the same exertion to acquire a knowledge of any spoken language, and the child will easily excel the man. This is because ear, and the memory derived from ear, are the means by which languages are acquired. Reason enables us to predict what is probable, when we know that which has previously occurred. If, then, we informed a reasoning individual that a chair, an article made of wood, with four legs, was feminine in French, and then called his attention to a stool, an article made of wood, with four legs, and inquired to what gender he considered the stool belonged, he would naturally conclude that it also was feminine; but a stool (*tabouret*) is masculine in French.

Then, again, the pronunciation of words is purely arbitrary. Take our own language, for example, and such words as plough, enough, cough, dough, bough, rough, &c. Where does reason enter into the pronunciation of such words?

What power of intellect would enable us to pronounce 'cough' correctly, even though we knew how 'bough' was spoken? Yet, in spite of these unreasonable laws, classics and modern languages are not unusually referred to, not as stored knowledge, but as tests of mental power. As a rule, it is not the reasoner, or person gifted with great brain-power, who the most quickly learns a language, but the superficial thinker, gifted with ear; and these superficial people are the first to quiz any error made, when a speaker attempts to converse in a foreign language.

We may fairly divide the subjects employed in modern mental training into those which store, and those which strengthen the mind. Languages; a knowledge of history and geography; the facts connected with various sciences, such as chemistry, electricity, astronomy, &c., are stores; but not one of these does more than store the mind. Men's minds were stored with a certain number of astronomical facts when Galileo attempted to revive the olden belief that the earth rotated; but their minds had not been strengthened, as it was the leading astronomers who most offered opposition to him. Several men with stored minds were the great opponents of Stephenson when he talked about travelling twenty miles an hour on a railroad. So that it appears that no matter how well a mind may be stored, if it is incapable of judging correctly on a novelty, it cannot be called a strong mind.

Our competitive examinations tend almost entirely to bring to the front those whose minds are the best stored, and many persons therefore have come to the conclusion that by such a course we have obtained for our various services what are termed 'the cleverest youths.' It does not, however, follow that this result has been obtained. The greatest brain-power may actually be low down in the list of a competitive examination in which stored knowledge alone has been requisite. There is a certain advantage to be gained by storing the mind with facts, and some people imagine that a knowledge of these facts indicates an educated and strong mind. It, however, merely proves that the mind has been stored; it does not prove it to have been strengthened. We may know what Cæsar did under certain conditions; how Alfred the Great organised his police so that he could hang bracelets of value on signposts without fearing that highwaymen would steal them; and a multitude of other similar facts may have been stored in our minds; but any quantity of such stores would not enable an individual to solve the present Irish difficulty, unless he could find in the past an exactly similar case which had been treated successfully by some particular system.

It is even now considered that by making a boy pass through a long course of mathematics or classics, and then testing his acquired knowledge by an examination, we adopt the best method of obtaining the greatest brain-power. We may derive an advantage, supposing mathematics or classics are requisite in the future career of the boy; but as a test of brain-power and perseverance, we would much sooner select the boy who could the most rapidly and most certainly solve a three-move chess problem. And if mathematics are not required in the future career of a boy, it would be equally as unreasonable to

devote three years to the solution of chess problems, as it is to devote a like period to the solution of the higher branches of mathematics. In both instances, the mental exercise is supposed to be for the purpose of strengthening the mind, and the chess problems are certainly as efficient as the mathematical. It is not unusual to find a profound mathematician who is particularly dull in all other subjects, and who fails to comprehend any simple truth which cannot be presented to him in a mathematical form; and as there are a multitude of truths which cannot be treated mathematically, a mere mathematician has but a limited orbit.

A chess-player, again, or a solver of chess problems, has always to deal with pieces of a constant value; thus, the knight, bishop, pawn, &c., are of constant values, so that his combinations are not so very varied. A whist-player, however, has in each hand not only cards which vary in value according to what is trump, but during the play of the hand, the cards themselves vary in value; thus, a ten may, after one round of a suit, become the best card in that suit. Brain-power independent of stored knowledge is therefore more called into action by a game of whist than it is by mathematics, chess, or classics; consequently, whilst mathematicians and classical scholars may be found in multitudes, a really first-class whist-player is a rarity; and if we required an accurate test of relative brain-power, we should be far more likely to obtain correct results by an examination in whist, than we should by an examination in mathematics. In the latter, cramming might supply the place of intelligence; in the former, no amount of cramming could guard against one-tenth of the conditions. A first-rate mathematician may on other subjects be stupid; a first-class whist-player is rarely if ever stupid on original matters requiring judgment.

A very large amount of the elements of success consists in the advantages with which an individual may start in life, and over which he himself may have no control. The case of Smith and Brown already referred to may serve to illustrate this fact. When conclusions are arrived at relative to hereditary genius, these advantages may be considered. The son of a judge becomes a judge, and we may claim hereditary genius as the cause. We should, however, be scarcely justified in assuming hereditary genius because the son of a general officer became this general's aide-de-camp. A general officer with five thousand efficient troops gains a complete victory over fifteen thousand indifferently armed savages, and he is looked upon as a hero. Another general with a like number of men is defeated by an army of ten thousand well-armed but unsoldier-like-looking men, and he is regarded as a failure; and yet of the two, the defeated army may have possessed the better general. In order, therefore, to judge of the relative powers of two individuals, we must take into consideration all the advantages or difficulties with which each starts in life, or in any undertaking. The relative success is by no means the only criterion from which to judge of capacity, any more than it would be correct to judge of the capacity of two whist-players, when one held four by honours and six trumps,

and his adversary held a necessarily inferior hand.

In the great battle of life, these conditions are perpetually interfering with the results to be derived from the relative value of brain-power, and are so numerous as to have an extensive influence. For example, a man possessing great brain-power has succeeded in attaining an official position of eminence. He selects a nephew or particular friend to be his assistant. We have competed with this assistant in various things, and there is no doubt as to his inferiority. Time goes on, and this assistant succeeds to the post of his relative merely from what may be called departmental claims, and he is *ex officio* supposed to be possessed of the talents and knowledge which appertain to his post. Our opinion, if opposed to that of the official, will by the superficial outsiders be considered valueless; yet ours may be correct, and that of our opponent erroneous. It is by such means that very feeble men often occupy official scientific positions to which they are by no means entitled in consequence of their intelligence.

When such an event occurs, an immense amount of damage is done to the cause of truth and real science, because the individual thus raised by personal interest to the position of a scientific judge or referee, too often fails to judge of a question on its merits, and condemns it if it be not in accordance with routine. A question thus disposed of, is very difficult to again bring into notice without prejudice. There is no doubt that even among the so-called educated people, the majority possess only stored minds, and are incapable, consequently, of reasoning on any problem, other than by bringing to bear on it their stock of knowledge, which probably, granting the problem is original, will not apply. No educated person doubts that the earth is a sphere; but few of these can prove that it is so by means of facts with which they are acquainted, though a simple law of geometry is able to prove the fact.

The average occupations of young men require nothing more than stored minds and powers of observation; consequently, our competitive examinations serve to some extent to bring to the front such qualifications. But it is not among such that we obtain our discoverers, inventors, great statesmen, or good generals. The mere routine man will almost invariably bring about a disaster when he has novel conditions to deal with; and as a rule, the routine youth comes out best at an examination.

At the present time, we have apparently no accurate test by which to measure the relative brain-power of individuals. Competitive examinations cannot do so, for the reasons that we have stated. Success in life is, again, dependent on so many influences quite outside of the individual, that this success is no test. The accumulation of money—that is, 'getting rich'—is too often but the results of selfishness and cruel bargains, and cannot be invariably accepted as a proof of brain-power.

Considering these facts, therefore, it appears that just as intellect is invisible, so the relative power of intellect is unmeasurable; and instead of forming hasty conclusions as to the relative powers of two men, from the results of examina-

us, we may perceive that by such means we may be selecting those only who, under certain conditions, have succeeded in storing their minds with the facts required for that examination.

VALENTINE STRANGE.

A STORY OF THE PRIMROSE WAY.

CHAPTER XL.—‘GERARD,’ HIS MOTHER HAD SAID, LOOKING WITH AN AWFUL FOREBODING FEAR AT HIS FACE, ‘YOU WILL BEAR IT FOR YOUR FATHER’S SAKE. THERE ARE THINGS WORTH LIVING FOR YET.’

AND so in the race of love Val Strange won, and Gerard Lumby lost. After the one great outburst of grief, Gerard took things quietly, so very quietly, that those who knew him thought it dangerous. The wedding-party at Lumby Hall broke, as may be easily imagined, into most admired disorder, and took its devious way homeward in much astonishment, indignation, and sympathy.

From the time of her first coming to the county, Constance had been unable to secure the favourable verdict of the feminine population. It would be perhaps too cheap a satire to say that she outshone them all, and to find in that the sole reason for her unpopularity. She was not prouder than other women; but somehow she looked proud, and her beautiful face and figure wore a seeming of haughtiness which was quite an accident of aspect, and had nothing to do with her nature. The ladies, then, went away with a very dreadful impression of her. The graver scandals her elopement might have caused were set at rest by the arrival of a message from her husband. Val had started with a special license in his pocket, and they had been married the day after their flight; not at Swansea, but at a little village on the coast where he had a friend who was a clergyman. Five hundred pounds seems an absurdly large sum to have offered as a bribe to Constance’s maid; but the fact was that Constance had flatly refused to move without her, and Mary’s obstinacy had driven Val almost to his wits’ end. And he was so eager, that, to secure his purpose, ten times the sum would have seemed nothing to him. He gave little Mary the cheque after the wedding; but she did not know what to do with it, and was so miserable and frightened when she thought of facing Hiram, that Constance kept her, and they sailed away together, first to Ireland, and afterwards to the Mediterranean. Val, in a letter to Mr Jolly, proposed to make settlements so liberal upon his wife, that the old gentleman, when the first shock was over, began to regard the matter even complacently. The girl had got married any way, though it had scarcely been done becomingly. And she had married the wealthiest man in the county after all; and what was done being done, Mr Jolly felt it better to say no more about it, but to take the good provided, to ignore the discomforts attendant upon it, and be thankful. But being a man who in all things consulted the dignities and decencies of life, he feigned at first to be stricken quite through and through with grief, and sold the lately-purchased Grange. It was given out that he was quite heart-broken; but he made

a reasonable profit on the transaction, and was back in Paris in a fortnight from the date of his daughter’s flight, strolling gaily along the asphalt, and enjoying himself hugely as a widower at large.

Mrs Lumby had at first dreaded the shock this new disaster would probably bring to her husband’s weakened mind. But he, reading Gerard’s quietude wrongly, was less perturbed than she had feared, and indeed accepted the evil with an equanimity of resignation which would have been impossible to him in the days of mental and physical health. Even Gerard’s heart was a little comforted in a little while by the failure of the blow to wound his father. For himself, he bore the blow with amazing fortitude; but those who knew most of him liked his quiet least. To his father and mother and to Milly, and even to the servants, he was gentle and quiet, but there was a resolved sternness in his manner, beneath its gentleness, which was new and alarming. But there was only one who had real warrant for knowing what the quiet of his demeanour covered. This was Hiram.

The terrible night of Hiram’s disclosure Gerard passed alone.

‘Gerard,’ his mother had said, looking with an awful foreboding fear at his face, ‘you will bear it for your father’s sake. There are things worth living for yet.’

‘Yes,’ he answered; ‘there are things worth living for.’ But the foreboding haunted his mother’s heart all night, and she lay praying and trembling, and scarcely dared to own her fear even to herself. There are terrors to which even in the recesses of our own hearts we dare scarce give form, and this was one of them. In the morning, when Hiram’s story, which had never seemed to need any confirmation, was confirmed, Gerard rang his bell, and summoned last night’s messenger to his dressing-room.

‘What set you upon the scent?’ he asked. ‘Or did you find it out by accident?’ His face was gray and hard, like stone, and Hiram had scarcely the heart to answer him.

‘The first thing was,’ he responded after a pause, ‘a portrait I saw in his portmanteau the day he came here.’

‘A portrait?’ said Gerard. ‘Whose portrait?’

‘Miss Jolly’s,’ said Hiram, fearing to pronounce the name, but being compelled to answer.

‘I suppose,’ said Gerard, ‘that the portmanteau is still here?’

‘I believe it is,’ said Hiram.

‘Let me see it,’ said Gerard, rising. ‘Is the portrait still there?’—Hiram could not say.—‘Let us see,’ his master said; and turning to the door, led the way to the room Val Strange had occupied. ‘Open it!’—glancing at the portmanteau. Hiram obeyed, and tumbled the things over. The portrait was gone, but the envelope was there still, and Hiram held it up.

‘It was in this,’ he said.

Gerard took it from his outstretched hand, and turned it over, and read the inscription—‘Thy grace being gained, cures all disgrace in me.’ A short hard laugh escaped him, and he folded the envelope with great care and put it in his pocket-book. But half-a-dozen times in the course of the day, Hiram saw him looking at it with an expression which betokened no

good for the writer of the line. 'Go on,' he said coldly, when he had put back his pocket-book with the envelope in it. Hiram told the story as we know it.

'Is there a gentleman in your case too?' asked Gerard. 'Are we in the same boat, Search?'

'I don't like his way of takin' it at all,' said Hiram to himself, returning no audible answer to that cynical inquiry. 'It looks mischeevous.'

'If there should prove to be a gentleman in your case, what shall you do, Search?' asked Gerard.

Hiram liked his tone and manner less than ever. 'I shall let him slide,' he said, 'and I shall think myself well out of a bad bargain.'

'I shan't let him slide, Search,' said Gerard, very very softly. He had a hand on Hiram's arm, and gripped it so that he made him wince. There was not another word spoken between them; and Gerard, though Hiram saw him several times reading the line on the frayed envelope, never recurred to the subject.

It need scarcely be said that the names of the runaways were never spoken in his presence, or that in spite of that fact they were much talked of. Many a time the sound of Gerard's solid step hushed the talk of his mother and Milly; but the young fellow's stony face never gave a sign that he knew the theme of their converse. Many and many an unspeakable pang his loyal heart suffered, but after the one outburst he hid everything. There was much to trouble his mother in those hard days; but she took everything as women do, with that sublime and quiescent heroism which is the best of their many virtues. A good wife and mother—how shall she be praised? Not—though the wise man of old so praised her—that she seeketh wool and flax and worketh willingly with her hands, and, like the merchant's ships, bringeth her food from afar; but yet as the wise man praised her, that the heart of her husband doth safely trust in her, and that her children have a right to arise and call her blessed. Though she feared for Gerard, in the unnatural calm he bore, she was yet not without pride in him. He was a man, this baby she had nursed. Oh, quaint and sweet and pitiful! she remembered—she saw—the infant almost every time she looked at the man, and had just such a tenderness for him now as she had when she nursed him, and no less a desire to protect and defend him. It was one of the poor soul's griefs that she could protect and defend him no longer. Mothers suffer in that way. And yet she was proud that her son bore his grief manfully, and stood under Fate's heaviest inflictions in this rock-like calm, that would not move till riven. Amongst her griefs was one which I must needs indicate; but I leave it with an indication and no more. From the time of Constance's flight, Gerard refused to set foot in a church, or to sit at that decent ordinance of family worship which had always formed one of the household ways. In other matters, he did with a certain heaviness and solidity of manner, as though it were a task, what he had once done gracefully and naturally. He was much alone, riding solitary over the moors and about the coast. He liked to have Hiram with him at times; but he very rarely spoke to him.

The gaunt Yankee could ride as well as he could do anything else, and he used to hang a little behind his master, mounted on a nervous finicking thoroughbred, ruling him with half-unconscious skilful hand, whilst he kept his eyes for the most part fixed on the figure ahead of him. The whole countryside became familiar with Gerard, riding lonely, or paired with Hiram; and the general sympathy was loud on his side, and deep in its condemnation of Val Strange.

And now from purpling moors, and fields yellowing to the sickle, and a sky of English haze, let us get to the Mediterranean and join the wedded lovers. The sea is of that perfect blue which only lives in its waters. Every slow-heaving wave that falls against the vessel's side looks hollowed from some transcendent liquid jewel—the colour of the sapphire is shallow by the side of it—and every time the crest tumbles over, it shakes and breaks into diamonds. The sunlight rains down a million little arrowy points of light upon the waters. There is land on each side, if those purple cloud-like fantasies that seem to rise and fall at such vast distances are really of the earth and earthy.

Val and Constance are lolling near each other on the deck, in cane-chairs, sheltered from the sun-god's too savage courtship of the sea by a canvas awning.

'You are sad, Val,' said Constance, looking up from her book.
